* and † are respectively the first and second 'inversions' of the chord. These three are the notes which nature gives us as producing a perfect sound in combination (see HARMONICS); they are therefore called 'consonances,' and any foreign element is a 'dissonance.' This 'common chord' or 'triad' makes a starting-point and a point of finality from which the harmonies proceed, round which they rally from time to time, and into which finally they resolve themselves. It is with few exceptions the first and invariably the last chord in any composition. One dissonance suffices to change a concord to a *discord*, which can be effected by adding to the notes of this common chord, or by changing their relationship to each other, &c.; and the fundamental law of harmony is that discord as an *incomplete idea* must give place to concord before the ear can be satisfied. This process is called 'resolving' the discord. Thus concords stand firm like the straight lines or outstanding features in a landscape; while discords supply the curved lines of beauty, the effects of perspective, and the variety which gives interest to the picture.

Discords.—The seventh harmonic of nature which is a minor seventh distant from the root—i.e. one semitone less than the seventh consecutive note in an ascending major scale—produces a discord which, with its complementary or *fulfilling* concord, is the foundation of all harmony. This discord is called the DOMINANT SEVENTH (its sign is V_7), and its 'resolution' is the triad of the key to which it belongs—i.e. the chord of the tonic (I.).

A is an example of 'close,' B of 'open' or 'extended' harmony. Because the discord on G seems thus to demand the chord of C as its resolution, the note G (or similarly the fifth degree in any scale) is called the *dominant* (V.) of that key, and the chords and discords built on it constitute the dominant harmonies. Position B is the most satisfactory to the ear, because of the effect of finality induced by the resolution to the first position of the triad; and the two chords together form the *dominant* or *authentic cadence*—the most important of those terminal phrases which serve in music much the same end as commas, semicolons, and periods in composition. 'God save the King' offers examples of two other important cadences, showing at the same time how these mark the completion of more or less final musical periods.

I. V. V₇. vi. V₇. I.

The first period is closed at A by a 'half' or 'imperfect' cadence—i.e. the order V.—I. is reversed; the second at B by a 'false' or 'deceptive' cadence—i.e. the dominant chord, instead of proceeding to the tonic, 'deceives' the ear by proceeding to another chord; the third period is brought to a close by the authentic cadence at C.

The dominant chord can also bear the more elaborate dissonances of the ninth, eleventh, and thirteenth, as well as the seventh.

Key F. Gounod's *Faust*.

Root C (V.).....Root F (I.)

It is impossible here to enter into the varieties of discord—'suspensions,' 'double-root chords,' &c., into the analogous discords which may be built on the tonic as a ground-note, or the chords belonging to the minor scale. Suffice it to say the effects which can be evolved from the almost innumerable inversions and involutions of single chords and combinations of chords are subject to natural laws as stringent as those governing the growth of flowers and trees, and the possibilities of variety in this unity are as infinite.

Modulation.—One branch of the subject can **Authentic.**

DORIAN. LYDIAN.

Final. Dominant. Final. Dominant.

The Dorian and Æolian, and less frequently others even more at variance with our conventional scale, are still in occasional use; and peculiarly plaintive effects can be obtained from the absence of the 'sharp seventh' to which our modern ears are so accustomed.

In Counterpoint, the science which preceded harmony, attention was given altogether to the correct progression of the individual voices or parts, while the combinations made by the voices at any moment were regarded as merely accidental. But unconsciously the ear of musicians was being cultivated, and the richness of Palestrina's simpler

hardly be left without mention—i.e. *modulation* or change from one key (or 'mode') to another. Our modern scales have had the relation of their intervals so modified (see TEMPERAMENT) as to be approximately alike. By the addition of a single sharp or flat any melody can proceed from the key of C to G (with F \sharp), F (with B \flat), or A minor (with G \sharp). These—the dominant, subdominant (next below the dominant), and the minor of the sixth degree—are the keys of the *first relation*, as out of the seven notes which constitute each scale six are present in the scale of C, thus providing as it were six more or less convenient bridges by which to pass from one key to the other. The conventionality of these modulations makes them inadequate to convey the more passionate colouring of modern music, and more striking changes to remoter keys are necessary. A favourite device with modern composers is to take advantage of the 'tempered' system, and by using one note in two significations (e.g. F \times E \sharp) to secure means of startling and also of very tender effects in modulation.

History.—The complete Greek scale as formulated by Pythagoras is represented by three octaves of our scale of A minor, beginning at the A in the first space of the bass clef, and using no black notes. Various sets of eight notes selected from this extensive scale were called after districts of Greece, &c., and in the 4th century St Ambrose adopted four of these names when he laid the foundation of modern music in what are called the Gregorian Modes. They received their name from Pope Gregory, who added four others beginning on the respective dominants, and called them *plagal*, as distinct from the *authentic* modes of St Ambrose. The most important of these are

Plagal.
HYPODORIAN or ÆOLIAN. HYPOLYDIAN or IONIAN.

Final. Dominant. Final. Dominant.

writings must have shown the possibility of obtaining undreamt-of effects from chords as integral units in a march of harmonies, rather than accidental combinations of independent melodies. One of the fundamental rules of counterpoint was that a dissonance must either be 'prepared'—i.e. it must appear as a consonance in the previous chord—or else it must be approached very gradually. This rule of the old science was disregarded by Monteverde (1608), who used unprepared discords, and thus at one blow the new feeling for chords was released from its bondage to counterpoint.

The chords at * present the same discord—the eleventh and seventh on A, the dominant of D. The first is carefully prepared, and so has a smooth effect; the second is quite 'free' in its entry, and has a sudden and startling effect.

Only one who understands counterpoint and harmony can appreciate the full importance of the new departure. It meant that discords were no longer mere variations of concords, but individual creations with an individual's rights and duties. The discord most easily used was the dominant seventh, the first discord produced by nature's harmonics; and so the relation of dominant to tonic—the central idea of all harmony—developed from an increasingly general tendency into a recognised rule. During the 17th century many experiments were made by Monteverde's followers, until at the end of the century Rameau's famous treatise called attention to the fact that all chords are derived from some note which is the generator or root, and the relationships of these roots govern the progressions of the harmonies. The less known, but hardly less important, researches of Tartini formed a good supplement to Rameau's theory; and the basis of scientific harmony established by these two works has not been seriously disturbed even by the thorough investigation and the astonishing discoveries of Helmholtz, who extended the foundation and built a complete superstructure thereon. In the meantime, while theorists fought each other with great fierceness just as their successors do to-day, the science made extraordinary progress under such practical harmonists as Bach, Mozart, and Beethoven. Bach's daring but unerring feeling for harmony, his grasp of the mysteries of chord-relationship, and his unequalled skill in part-writing enabled him as early as the beginning of the 18th century to transform an ordinary progression of simple chords into such a passage as

The accented dissonances (*), so smoothly introduced and yet so striking, are extremely effective. Haydn's work, and Mozart's also, is considerably softer; their use of discord proved insufficient for the expression of the great passion which is the feature of Beethoven's later work. The romanticism of Schumann required still freer scope, and Wagner, who handled any number of parts as easily as did Bach himself, enlarged the possibilities of harmony so far that it was difficult for contemporaries to conceive of any further advance. Theoretical harmonists have followed fast in the train of the great composers, and, as system after system proved inadequate for the analysis of new harmonies or new uses of old harmonies, the revered names of each generation have been pushed aside more or less contemptuously by succeeding schools.

Among the most famous works on harmony are those by Rameau, Logier, and Dr Day; Richter's text-book was long used at Leipzig Conservatorium. Sir George Macfarren's *Harmony* was founded on Dr Day's system; Sir Frederick Ouseley's was even more scientific; most readable was Sir John Stainer's *Theory of Harmony*. Sir George Macfarren's six *Lectures* gave a popular account of the progress of harmony. See also Sir Hubert Parry's article in Grove's *Dictionary of Music*, and P. C. Buck's *Unfigured Harmony* (1911).

Harmony of Gospels. See GOSPELS.

Harmotome, a Zeolite (q.v.), consisting of hydrated silicate of aluminium and barium. Twinned crystals, cross-shaped in section, are characteristic.

Harms, CLAUS, German divine (1778-1855), whose memorial work, *Das sind die 95 Theses oder Streitsätze Luthers* (1817), in celebration of the tercentenary of the Reformation, produced a sensation in Germany.

Harnack, THEODOSIUS, a Lutheran theologian, was born at St Petersburg in 1817, and studied at Dorpat, where he was professor of Theology from 1848 to 1853, next till 1866 at Erlangen, and again at Dorpat till his retirement in 1873. He died in 1889. His principal works are his *Praktische Theologie* (3 vols. 1877-82) and *Katechetik und Erklärung des kleinen Katechismus Luthers* (2 vols. 1882).—Of his sons, all of whom have attained to some distinction, the most famous is ADOLF, who was born 7th May 1851 at Dorpat, where he studied from 1869 to 1872. He was appointed *privat-docent* for church history at Leipzig (1874), extra-ordinary professor there (1876), and ordinary professor successively at Giessen (1879), Marburg (1886), and Berlin (1888). His chief writings are *Zur Quellenkritik der Geschichte des Gnostizismus* (Leip. 1873); *Die Zeit des Ignatius und die chronologie der antiochenischen Bischöfe* (Leip. 1878); *Das Monachtum, seine Ideale und Geschichte* (2d ed. Giessen, 1882); *Lehrbuch der Dogmengeschichte* (3 vols. 1886-90; Eng. trans. (1894-99); *Die Geschichte der altchristlichen Literatur* (1893). *The Outlines of the History of Dogma* (1893) is a translation of the *Grundriss*. Prussian orthodoxy was greatly scandalised by his treatment of the Apostles' Creed in *Das apostolische Glaubensbekenntnis* (1892), and by *Das Wesen des Christentums* (trans. 1901). With Von Gebhardt and Zahn he edited the *Patrum apostolicorum opera* (1876-78); with Von Gebhardt the *Texte und Untersuchungen zur Geschichte der altchristlichen Literatur* (1882-94; new ed. 1910). His *Expansion of Christianity* was translated in 1904-5. In 1905 he was appointed director of the Royal Library at Berlin.

Härnösand, or HERNÖSAND, a Swedish port on the Gulf of Bothnia, 250 miles W. of Stockholm. Capital of the län of Västernorrland, it exports timber, wood-pulp, and iron. Pop. 8500.

Haro, a town of Spain, 31 miles by rail NW. of Logroño, is situated on the right bank of the Ebro. Good red wine is grown. Pop. (1920) 8188.

Haro, CLAMEUR DE (*Cry of Haro*), an old Norman form of appeal. By crying before witnesses 'Haro! Haro! Haro! À l'aide, mon Prince, on me fait tort,' Channel Islanders can still stay proceedings and bring into court cases of encroachment of property or infringed rights. Formerly considered an appeal to Rollo, first Duke of Normandy, Haro is more probably from O.H.G. *hera* or *hara*, 'here!'

Haroëris, the elder Horus, son of Seb, the Egyptian Saturn, and Nu, or Rhea. He was the brother, and not the son, of Osiris; and he was ruler over the heaven. He was identified with the sun and Apollo. See EGYPT.

Harold I., surnamed HAREFOOT, king of England, was the younger of Cnut's two sons by his first wife, Alfgiva. On the death of Cnut in 1035 the witan bestowed upon Harold all the provinces north of the Thames; while the possession of Wessex in the south was given up to Cnut's second wife, Emma, for her son Hardicanute. But in 1037 Wessex also submitted to Harold. Beyond a futile invasion of the country by Alfred, son of Ethelred, and raiding incursions by the Welsh and Scots, Harold's reign was

marked by no events of importance. He died at Oxford in March 1040.

Harold II., the last of the native English kings, was the second son of Earl Godwin by his Danish wife Gytha, the sister of Earl Ulf, and was born about 1022. At an early age he was made Earl of the East Angles, and he shared his father's outlawry in 1051, finding a refuge in Ireland. Next year, together with his brother Leofwin, he crossed the Channel with nine ships, defeated the men of Somerset and Devon at Porlock, and ravaged the country, next joined his father at Portland, and shared the triumph of his return. Harold was at once restored to his earldom, and next year (1053) succeeded to his father's earldom of the West Saxons. Henceforward he was the right hand of King Edward, and still more after the deaths of the old Earls Leofric and Siward, he directed the whole affairs of the kingdom, with an unusual union of gentleness and vigour. His brother Tostig succeeded Siward as Earl of the Northumbrians in 1055, and two years later two other brothers were raised to earldoms: Gurth to that of the East Anglians, Leofwin to one formed out of Essex, Kent, and the other shires round about London. Meantime Harold drove back the Welsh marauders of King Griffith out of Herefordshire, and added that post of danger to his earldom. The death in 1057 of the Ætheling Edward, the son of Edmund Ironside, who had been brought back from Hungary as heir to the throne, opened up the path for Harold's ambition, and from this time men's eyes rested on him as their future king. And nature had equalled fortune in her kindness, for his handsome and stalwart figure and his gentle and conciliatory temper were kingly qualities that sat well upon his sagacity, his military skill, and his personal courage. Harold's policy throughout was thoroughly English, contrary to the predominant French influences that had governed the early part of Edward's reign. He was English in everything, even to his preference for secular priests to monks. He made his pilgrimage to Rome in 1058, and after his return completed his church at Waltham, known later as Waltham Abbey. In 1063, provoked by the fresh incursions of Griffith, he marched against him, and by making his men put off their heavy armour and weapons, and adopt the Welshmen's own tactics, he was able to traverse the whole country, and beat the enemy at every point. Griffith was killed by his own people, whereupon Harold gave the government to the dead king's brothers, Bleddyn and Rhiwallon, who swore oaths of fealty both to King Edward and to himself.

It is impossible to say exactly at what date occurred that famous visit of Harold to the court of Duke William in Normandy, of the results of which the Norman writers make so much, although with many contradictions, while the English writers with the most marked and careful unanimity say nothing at all. It seems most likely that Harold did make some kind of oath to William, most probably under compulsion, when he had fallen into his hands after being shipwrecked on the coast of Ponthieu, and imprisoned by its Count Guy. Mr Freeman thinks the most probable date to be 1064. It is at least certain that Harold helped William in a war with the Bretons, and in the Bayeux tapestry we see his stalwart form lifting up two Normans at once when they were in danger of being swept away by the river Coesnon which divides Normandy from Brittany. The Norman writers make Harold formally swear fealty to William, promising to marry one of his daughters, and we are told that additional sanctity was given to this oath by its being made upon a chest full of the most sacred relics.

In 1065 the Northumbrians rebelled against the rule of Tostig, and Harold found himself compelled between policy and a sense of justice to side with them, and to acquiesce in their choice of Morcar and the banishment of Tostig. At the beginning of 1066 King Edward died, his last breath being to recommend that Harold should be chosen king. He was crowned on January 6, and at once set himself with steadfast energy to consolidate his kingdom. At York he won over the reluctant men of Northumbria, and he next married Ealdgyth, Griffith's widow, in order to secure the alliance of her brothers, Morcar and Edwin. His short reign of forty weeks and one day was occupied with incessant vigilance against the attacks of two formidable enemies at once. Duke William lost no time in beginning his preparations for the invasion of England, and Tostig, after trying the Normans and the Scots, and filibustering along the coasts on his own account, succeeded in drawing to his side the famous Harold Hardrada, king of Norway. In the month of September the two reached the Humber, and Harold marched to meet them, resting neither day nor night. The Icelandic historian Snorri in his dramatic narrative of the fight tells how Harold rode out accompanied with twenty of his housecarls to have speech with Earl Tostig and offer him peace, and when asked what amends King Harold should have for his trouble in coming, replied, 'Seven feet of the ground of England, or more perchance, seeing he is taller than other men.' At Stamford-bridge Harold overtook his enemy, and after a bloody struggle won a complete victory (September 25, 1066), both Tostig and Harold Hardrada being among the slain. But four days later Duke William landed at Pevensey. Harold marched southwards with the utmost haste, bringing with him the men of Wessex and East Anglia and the earldoms of his brothers; but the two earls Edwin and Morcar held aloof and kept back the men of the north, although some of the men of Mercia, in the earldom of Edwin, followed their king to the fatal struggle which was fought out from nine in the morning till past nightfall on the 14th October 1066. The English fought with the most stubborn courage, and the battle was only lost by their allowing the pretended flight of the Normans to draw them from their impregnable position on the crest of the hill, ringed with an unbroken shield wall. On its slope right in front of the Norman army waved the golden dragon of Wessex, as well as the king's own standard, a fighting man wrought upon it in gold. Here Harold stood with his mighty two-handed axe, and hewed down the Normans as they came. Before nightfall he fell pierced through the eye with an arrow. His housecarls fought where they stood till they fell one by one; his brothers Gurth and Leofwin died beside him. The king's body was found upon the field, recognised only by a former mistress, the fair Eadgyth Swanneshals ('Edith of the swan's neck'). At first William ordered it to be buried on the rocks at Hastings, but seems after to have permitted it to be removed to Harold's own church at Waltham. Than Harold no braver or more heroic figure ever filled a throne; no king ever fought more heroically for his crown. If he failed, it was because he had to bow his head to fate, and in his death he saved all the honour of his family and his race. His tragic story has given a subject for a romance to Lytton, and for a stately drama to Tennyson. For the history, see vols. ii. and iii. of Freeman's *History of the Norman Conquest*.

Harold I., surnamed HAARFAGER ('Fair-haired'), the first king of all Norway, was the son of Halfdan the Black, the most powerful of the jarls or petty kings of south-eastern Norway. According to the popular story, he loved a high-

born maiden named Gyda, but she declared she would not be his wife until he was sole king of Norway; he in his turn thereupon took an oath that he would neither cut nor comb his hair until he had accomplished her bidding. After a severe struggle of some years' duration (863-872) he subdued, first the chiefs between Thronthjem and the Sogne Fjord, and finally the kings of the south-west, whom he defeated in a naval battle near Stavanger. The conquered districts he placed under the rule of his own jarls, or such as were devoted to his service. This led many of the old nobles to emigrate to the Orkneys, the Hebrides, and to Iceland, whence they conducted a series of piratical expeditions against Norway, until at length Harold was constrained to sail westwards and chastise them in their own seas. In his old age Harold divided his territories amongst his sons, and died at Thronthjem, which he had made his capital, in 930, leaving the supreme power to his son Eric, surnamed Bloody-Axe.

Harold III., surnamed HAARDRAADE or HARDRADA ('stern in council'), king of Norway, and one of the most famous of the old Viking chiefs, was a descendant of Harold I. Whilst still a boy he was present at the battle of Stiklestad (1030), in which his brother, St Olaf, king of Norway, was slain. Harold himself sought an asylum at the court of his relative, Yaroslaff, prince of Novgorod. Thence, going on to Constantinople, he became captain of the Varangians or Scandinavian bodyguard of the Greek emperors, and in command of them defeated the Saracens in several battles in Sicily and Italy. On his return to Constantinople, he drew upon himself the vengeance of the Empress Zoe, whose proffered love he rejected, and with difficulty made good his escape to Russia, where he married the daughter of Duke Yaroslaff. But he did not remain in Russia. He returned about 1045 to Norway, where his nephew, Magnus (the son of St Olaf), agreed to divide the supreme power with him, in exchange for a share of his treasures. The death of Magnus in 1047 left Harold sole king of Norway, and Svend king of Denmark; but with Svend Harold waged unrelenting war until 1064. This king changed the capital of Norway from Thronthjem to Opslo, now a suburb of Christiania. Two years later he landed in England, to aid Tostig against his brother Harold, king of England, but was slain in battle at Stamford-bridge, where also the flower of his warriors fell.

Haroun, surnamed AL-RASCHID (more properly Harūn er Rashid, 'the orthodox'), the most renowned of the Abbaside khalifs, was born in 763, and succeeded his elder brother, El Hádi, in the khalifate in the year 786. He owed his peaceful accession to the sagacity of the Barmecide Yahya, whom he at once made his grand-vizier. To him and his four sons he left the entire administration of his extensive kingdom; and the energy of their administration, the enforcement of order, and the general prosperity of the country proved that his confidence was not misplaced. Meantime Haroun gave himself up to the pleasures of life, and his own taste and hospitality quickly made his court at Bagdad a brilliant centre of all the wit, learning, and art of the Moslem world. Himself an accomplished scholar and poet, he gathered round him the best scholars, poets, and musicians of his age, and heaped rewards upon them with lavish prodigality. Towards the end of his reign a strange and deeply-rooted hatred towards the Barmecides (q.v.) filled his mind, and in 803 he caused the vizier, his four sons, and all their descendants save one, to be executed, not even excepting his favourite Jafer (Giáfar), who had been his constant companion in his famous but apocryphal

nocturnal rambles through the streets of Bagdad. But the retribution of heaven quickly followed; his affairs fell into irretrievable confusion; treason and rebellion, no longer dreading the far-reaching arm of the able vizier, showed themselves in every corner of the empire; and, when it was too late, Haroun repented bitterly his ferocious cruelty. To quell a formidable rising in Khorassan, in the north-east of the empire, Haroun marched in person against the rebels, but an attack of apoplexy obliged him to remain behind in Tús, where he soon afterwards died, in the month of March 809. Haroun the Magnificent is the hero of many of the stories in the *Arabian Nights*, which have thrown a false halo round his memory; for with all his enlightenment, there was room in his heart for the most merciless and blood-thirsty ferocity. See Gibbon's *History*, Weil's *Gesch. der Chalifen*, and Professor E. H. Palmer's sketch in the 'New Plutarch' series (1880).

Harp, a musical stringed instrument, much esteemed by the ancients. In Egypt it attained an early and unequalled maturity, and is delineated in paintings from the earliest ages in many different forms. The great Egyptian harp stood nearly 7 feet in height, and carried 18 sonorous bass and tenor strings. Its immense frame shimmered with all the colours of the rainbow, and was further ornamented with massive carvings, gold, and precious stones. The Assyrian and biblical harp was a small instrument, easily carried in the hand, and resembling more a Lyre (q.v.) than a true harp. The harp was not in use among the Greeks and Romans; but the *kantela*, to which the Finns chanted the *Kalevala*, was a sort of primitive harp. The Celtic bards held the instrument in the greatest honour. The old Scottish harp was about 3 feet high, a foot and a half broad, and carried about thirty strings. Seven harps earlier than the 18th century are in existence, and are described in Hipkins' *Musical Instruments, Historic, Rare, and Unique* (1889). The Welsh triple harp is a large instrument, furnished with three rows of strings. Of these, two rows are tuned in unison and in the diatonic scale, the remaining one in the sharps and flats of the chromatic. In Ireland the harp was so celebrated an instrument in the remotest times that the Italians of the middle ages believed their harp to be derived from Ireland. The most familiar forms of harp are the Italian, the mediæval, and the pedal harp. The first is strung with two rows of wire-strings, separated by a double sound-board; this kind is now little used, being very imperfect. The second is in the form of a triangle, with a sound-board and gut-strings; it is always tuned in the principal key of the music, while the strings are altered to suit any modulations out of the key, by pressure of the finger, or turning the tuning-pins of certain notes. The adaptation of the harp to the modern chromatic scales led to the invention of the pedal harp, which has seven pedals, by which each note of the diatonic scale, in all the different octaves, can be made a semitone higher. The compass of the pedal harp is from contra F to D of the sixth octave above. In order to have the B flat, it must be tuned in the key of E flat. The music for the harp is written in the bass and treble clef, the same as pianoforte music. A celebrated harpist, Hochbrucker, in Donauwörth, invented the pedals in 1720; others say they were invented by J. Paul Verter, in Nuremberg, in 1730, who at least added the piano and forte pedal. The facility of playing chromatic intervals, and in different keys, was still more completely attained by the invention of the double-action pedal harp by Erard in Paris, in 1810. By means of Erard's invention, each string can be sharpened twice, each time a

semitone, so that the C string may be C flat its full length, C natural by the first movement of the pedal, and C sharp by the next movement. The double-action harp is tuned in the key of C flat.

Harpagophytum. See GRAPPLE-PLANT.

Harpe, JEAN FRANÇOIS DE LA. See LA HARPE.

Harper and Brothers, a well-known firm of New York publishers, consisted originally of James (1795-1869), John (1797-1875), Joseph Wesley (1801-70), and Fletcher (1806-77). James and John commenced to publish in 1818, and, under the style of J. & J. Harper, issued about 200 works. The firm of Harper and Brothers was established in 1833, and is now carried on by the descendants of the founders; it has large publishing premises in New York City. Besides books, the firm issues *Harper's Magazine* (monthly, since 1850), *Harper's Weekly* (since 1857), and *Harper's Bazar* (fashions, social life, &c., since 1867). The firm was reorganised in 1899. See J. H. Harper, *The House of Harper* (1912).

Harper's Ferry, a post-town of West Virginia, 81 miles W. of Baltimore, situated among beautiful scenery at the confluence of the Shenandoah with the Potomac. It was the scene of John Brown's abolition raid in 1859; and here a Union army of over 11,500 men, under General D. H. Miles, surrendered to Stonewall Jackson in 1862. The arsenal and armoury were burned in 1861, to prevent their falling into the hands of the Confederates.

Harpocrates, the name given by Greek writers to the younger Horus, the hieroglyphical inscriptions calling him *Har pa khrut*, 'Horus the child,' the son of Osiris and Isis. See EGYPT, ISIS, OSIRIS.

Harpoon, a large arrow attached to a hawser, which is used for spearing whales, and is either thrown by hand or fired from a gun. See WHALE.

Harp-shell (*Harpa*) a genus of tropical Prosobranch Gasteropods, representing the family Harpidæ. The shell is beautifully polished, with a large last whorl, a short spire, and strong longitudinal ribs suggestive of the strings of a harp. It has great decorative value. The living animal has a large foot without an operculum.

Harp-shell
(*Harpa imperialis*).

Harpichord, a keyed musical instrument, formerly in extensive use, but now little known. There were three

shapes: the 'grand' form, resembling a grand piano; the oblong, often called spinet or virginal; and the upright, this type very rare. The sound from the strings was produced by a small piece of crow-quill, or a piece of hard leather, which projected out of a slip of wood, called the jack, that stood upright between the strings, and was pushed upwards by the key, till the quill or leather twitched the string, causing a brilliant, but somewhat harsh sound, entirely deficient of any means of modification in respect to loudness or softness. Specimens of the harpichord, although now becoming more rare, are still to be found in good preservation, but are regarded rather as articles of vertu or curiosity than as useful musical instruments. Many Italian and Dutch harpichords were highly ornamented by the most eminent artists with valuable

panel paintings on the inside of the lid. The date of the invention of the harpichord is uncertain. It is first mentioned in the rules of the Minnesingers by Eberhard Celsne, in 1404, which places its invention in the preceding century. It was known in England in the 15th century, as mention occurs of it in a MS. dated 1502, where it is alluded to as no novelty. The Ruckers family were the great makers in Antwerp in the 16th and 17th centuries. In the 18th century Kirkman, and later Broadwood and Shudi, were the famous makers in London. The harpichord will be remembered in history as the instrument on which Bach and Handel played. After the invention of the pianoforte, the harpichord in all its varieties was gradually superseded by the new instrument. See PIANOFORTE.

Harpy, a fabulous creature in Greek mythology, considered as a minister of the vengeance of the gods. Various accounts are given of the numbers and parentage of the Harpies. Homer mentions but one, Podarge; Hesiod enumerates two, Aello and Okypete, daughters of Thaumasp by the Oceanid Electra, fair-haired and winged maidens, very swift of flight. Three are sometimes recognised by later writers, who call them variously daughters of Poseidon or of Typhon, and describe them as hideous monsters with wings, of fierce and loathsome aspect, with their faces pale with hunger, living in an atmosphere of filth and stench, and contaminating everything that they approached. The most celebrated tradition regarding the Harpies is connected with the blind Phineus, whose meals they carried off as soon as they were spread for him, a plague from which he was delivered by the Argonauts, on his engaging to join in their quest. The Boreads Zetes and Calais attacked the Harpies, but spared their lives on their promising to cease from molesting Phineus. Virgil locates them in the Strophades.—A harpy in heraldry is represented as a vulture, with the head and breast of a woman.

Harpy Eagle (*Thrasaetus harpyia*).

The harpy of the classical prose-writers was probably the Lammergeier (q.v.); but the name of the mythological monster of the poets has been transferred to *Thrasaetus harpyia*, a strong bird of prey whose range extends from Southern Mexico to Brazil. It has a huge bill and very formidable

talons, exceeds a golden eagle in size, and feeds mainly on mammals. A forked gray crest surmounts the white head. Many exaggerated stories have been told of the harpy's strength and ferocity. It never attacks man, though it may defend itself, and it never carries off children.

Harquebus. See ARQUEBUS.

Harraden, BEATRICE, a novelist who, born in 1864, has travelled widely and has taken an active and prominent part in women's movements and social reform. Her writings have considerable charm, though few come up to *Ships that Pass in the Night* (1893), one of her earliest. Her later works include *Katharine Frensham* (1903); *Spring Shall Plant* (1920), and *Patufa* (1923).

Harrar. See HARAR.

Harrier, a breed of dog used to hunt the hare by scent. The harrier probably owes its origin to the foxhound, though in some packs the strain has been kept pure for many generations. In appearance the harrier closely resembles the foxhound both in shape and colour, but is on a considerably smaller scale. The harrier, though deficient in speed, is able to hunt a much colder scent than the foxhound. They hunt in packs; and the sport forms an element in English country life. See Bryden's *Hare-hunting and Harriers* (1903).

Harrier (*Circus*), a genus of non-arboreal Falconidae, of slender build, with a somewhat weak, unnotched bill, with soft plumage and a slightly owl-like ruff on the face, with long legs and wings, and a characteristic gliding flight along the ground.

Hen-harrier (*Circus cyaneus*).

They live in the open country, are fond of marshy districts, and dexterously catch frogs, birds, and small mammals. The females are usually larger and darker than the males; the young are like the mother-birds; the nest is almost always on the ground, and the eggs (3 to 5) are white or blotched. The British species of harrier are (1) the Hen-harrier (*C. cyaneus*), almost exterminated in England, but still not uncommon in some parts of Scotland; (2) the Marsh-harrier or Moor-buzzard (*C. aeruginosus*), all but exterminated throughout Britain; and (3) Montagu's Harrier (*C. cinerascens*), never more than an occasional visitor. The marsh-harrier is abundant in many parts of North America.

Harriers. See ATHLETIC SPORTS.

Harrington, JAMES, author of the *Oceana*, a celebrated work, half romance, half treatise on political philosophy, written for the purpose of setting forth the best form of government for a commonwealth. The son of Sir Sapcotes Harrington of Upton, in Lincolnshire, he was born in January

1611, studied at Oxford under Chillingworth, and then spent some years on the Continent. In 1646, although a republican by conviction, Harrington was appointed one of the personal attendants of Charles I., and on the king's execution accompanied him to the scaffold. It was after this event that the *Oceana* was written; it was published in 1656. The salient points of the political doctrines therein expounded are these: the real basis of power is property, especially landed property; accordingly landed property should be distributed and held in such a way that no one person should derive from it more than a fixed amount of revenue; the rulers of the commonwealth should be changed every three years, their places being taken by others, elected by ballot. After the Restoration Harrington was arrested for alleged conspiracy, and during a severe imprisonment lost his reason. He died at Westminster, 11th September 1677. His writings, consisting, besides the *Oceana* (repr. by Henry Morley, 1887), principally of essays, &c. in defence thereof, were first edited by Toland in 1700. See a study by H. F. Russell Smith (1914).

Harrington, SIR JOHN, born in 1561 at his father's seat of Kelston, near Bath, studied at Eton and Christ's College, Cambridge, and afterwards was attached to the court of Queen Elizabeth, who had been his god-mother. His wit brought him into much favour, which he endangered by the freedom and the political allusions of his satires. In 1599 he served under Essex in Ireland, and was knighted by him on the field, much to the queen's displeasure. To fortify his application to King James for the office of Chancellor-archbishop of Ireland he composed, in 1605, *A Short View of the State of Ireland*, a most interesting and singularly modern essay (first edited by Rev. W. Dunn Macray, 1880). He died of dropsy in December 1612. He is now remembered chiefly as the translator of Ariosto's *Orlando Furioso* (1591) into English verse. His other writings were some Rabelaisian pamphlets, a number of fair epigrams, and *A Brief View of the State of the Church*, written for the Prince of Wales.

Harris, in the Hebrides, comprises the southern portion of the island of Lewis and a number of adjacent islets. Pop. (1921) 5275. See LEWIS.

Harris, HOWEL, one of the fathers and founders of Welsh Calvinistic Methodism, was born in 1714 at Trevecca, in the county of Brecon. His mind was first seriously awakened to religious questions in 1735, and for seventeen years from that date he spent his time as a lay itinerant preacher, but confined his ministrations for the most part to Wales (see METHODISM). After his retirement to Trevecca in 1752 he still continued to preach daily at his own home; and in order to accommodate those who came to hear him he built a large house, the inmates of which led a kind of monastic life. Harris died on 21st July 1773. See his *Autobiography* (1791) and W. Williams, *Welsh Calvinistic Methodism* (1872).

Harris, JAMES, a pre-scientific philologist, was born at Salisbury, July 20, 1709. His mother was a sister of the third Earl of Shaftesbury, author of the *Characteristics*. He had his education in his native city and at Wadham College, Oxford, whence he passed to the study of law at Lincoln's Inn. Finding himself at twenty-four on his father's death master of an ample fortune, he devoted himself to the assiduous study of the classics, but in 1761 he entered parliament, and later became Lord of the Admiralty, of the Treasury, and secretary and comptroller to Queen Charlotte. In 1744 he published a volume consisting of three treatises, on art, on music, painting, and poetry, and on happiness; and in 1751 his famous *Hermes*, an

interesting but scarce profitable inquiry into the philosophical basis of universal grammar. His incomplete *Philosophical Arrangements*, a study of the Aristotelian logic, was issued in 1775; and his *Philological Inquiries* on style and the true canons of literary criticism, in three parts—the last written in French (1780–89). He died in December 1780. Harris's works were collected, with a short life, by his son, the first Earl of Malmesbury (2 vols. 4to, 1801; 5 vols. 8vo, 1803).

Harris, JOEL CHANDLER, folk-lorist and novelist, was born in Eatonton, Georgia (1848–1908), and was in turn printer, lawyer, and journalist. His delightfully original and unexpected book, *Uncle Remus, his Songs and his Sayings: the Folklore of the Old Plantation* (New York, 1880), quickly carried his name even to the Old World, at once to children and to scientific students of folklore. Later works are *Nights with Uncle Remus*, *Mingo* (1883), *Daddy Jake*, *Aaron*, *Tales of the Home Folks*, *Plantation Pageants*, *Aunt Minervy Ann* (1899), and a history of Georgia (1899). See his *Life and Letters* by his daughter, Julia C. Harris (1919).

Harris, THOMAS LAKE (1823–1906), founder of the 'Brotherhood of the New Life,' was born at Fenny Stratford, accompanied his father to America, and had been a Universalist pastor, when in 1850 he was drawn into the spiritualistic movement. He lectured in Great Britain in 1859, founded an Independent Christian Society, and on his return to America reorganised his society as the 'Brotherhood of the New Life.' They numbered at one time about 2000 in America and Great Britain, and amongst them were Lady Oliphant and her son Laurence Oliphant, who, however, left him in 1881. His community moved from Wassaic, N.Y., to Brocton, N.Y., and there he opened and ran a wine business. Harris acted as the inspired head of the brotherhood, and under the highest pretensions his teaching is really an attempt to change sex relations as known and believed in. He demanded a blind obedience from his followers. He also taught that God is two-in-one, infinite in fatherhood and motherhood, and that all who become angels find their counterpart in sex, and are two-in-one to all eternity. Harris published many works in prose and poetry, amongst which are *Wisdom of Angels* (1856); *Arcana of Christianity* (1857); *Modern Spiritualism* (1860), &c. The influence of the teaching of Harris may be traced in Laurence Oliphant's *Masollam* (1886) and his *Scientific Religion* (1888); as also in Pulsford's *Morgenrothe* (1881). See his *Life* by A. A. Cuthbert (1909), and W. Oxley's *Modern Messiahs and Wonder-workers* (1889).

Harrisburg, the capital of Pennsylvania, is situated in the midst of beautiful scenery on the left bank of the Susquehanna River, which is here crossed by several long bridges, 106 miles W. by N. of Philadelphia. It contains the capitol, a court-house, the state arsenal, the state insane asylum, and a Roman Catholic cathedral. The city has blast-furnaces and rolling-mills, and large manufactures of steel and iron; cotton goods, flour, bricks, shoes, brooms, &c., are also produced, and there is a large trade in lumber. Founded in 1785, Harrisburg became the state capital in 1812. Pop. (1870) 23,104; (1910) 64,186; (1920) 75,917.

Harrismith, town in the Drakensberg Mountains, Orange Free State, 200 miles NW. of Durban by rail. Pop. 6500 (half white).

Harrison, a town of New Jersey, on the Passaic, opposite Newark, with which it is connected by a bridge. It has manufactures of oil-cloth and enamelled cloth, wire, thread, &c. Pop. (1900) 10,596; (1920) 15,721.

Harrison, BENJAMIN, twenty-third president of the United States, was born at North Bend, Hamilton county, Ohio, August 20, 1833. His father, the third son of President William Henry Harrison, was a small farmer, who, however, managed to educate his nine children. Harrison passed his early days on his father's farm, and after two years at a school called Farmer's College, near Cincinnati, was transferred to Miami University, at Oxford, Ohio, where he graduated in 1852. In 1854 he settled as a lawyer in Indianapolis, where his first earnings were as a crier of the Federal court. In a short time he was in full practice in all the courts. In 1860 he became candidate for supreme court reporter of Indiana, by nomination of the Republican party, and was elected. Entering the Union army pending the term, the office was declared vacant. In 1864 his party re-elected him with a largely increased majority. He remained in military service, however, and only resumed the reportership upon muster-out at the end of the war. He began his military career in 1862 by raising a company, in which his first commission was of second-lieutenant. He was then made colonel of the 70th Regiment Indiana Volunteers, and ordered to Kentucky. Carrying his studious habits into camp, he became a proficient drill-master. As colonel, sometimes brigade-commander, in the first division 11th Army Corps, he participated in Sherman's Atlanta campaign, distinguishing himself in the battles of Resaca and Peach Tree Creek, and he was in 1865 commissioned brevet-brigadier-general. He also took part in the battle of Nashville, under Thomas, in December 1864.

Returning to the law in Indiana, Harrison declined a third nomination as supreme court reporter. He took an active part in the Grant campaigns of 1868 and 1872, and was nominated for the governorship of the state in 1876; but, though he polled 2000 votes more than the rest of his party, he was defeated. Two years later he presided over the State Convention, and in 1880 he appeared in the Chicago National Convention as chairman of his state delegation. He then declined the use of his name for the presidential nomination; and he afterwards also declined a seat in the cabinet of President Garfield. In 1884 he was again delegate-at-large, and was discussed as a possible nominee for the presidency. In 1880 he was elected United States senator from Indiana; but at the end of his term of six years he was defeated for re-election, and returned to his law office. In 1888 Harrison received the presidential nomination and was elected over President Cleveland, the Democratic nominee, his election signifying the triumph of protection over free trade. In 1892 he was defeated for re-election by Mr Cleveland. He was chief counsel for Venezuela in the boundary controversy with British Guiana, and was a delegate to the Peace Conference (1899) at the Hague. He died March 13, 1901. See the *Life* by Wallace (1888).

Harrison, FREDERIC, was born in London, October 18, 1831, and was educated at King's College School, London, and Wadham College, Oxford, taking a classical first-class in 1853. He became Fellow and tutor of his college, but was called to the bar in 1858, and thereafter practised conveyancing and in the Courts of Equity. He sat on the Royal Commission upon Trades-unions (1867–69), served as secretary to that for the Digest of the Law (1869–70), and from 1877 till 1889 was professor of Jurisprudence and International Law at Lincoln's Inn Hall. A Positivist in religion and an advanced Liberal in politics, he has argued his opinions in many vigorous and well-written articles in the magazines and reviews, some of which have been reprinted separately. Of his works the chief

are *The Meaning of History* (1862), *Order and Progress* (1875), *Lectures on Education* (1883), *On the Choice of Books* (1886), *The Meaning of History* (1894), *Literary Essays* (1895), *Tennyson, Ruskin, Mill, &c.* (1900), *Byzantine History* (1900), a book on Ruskin (1902), *Memories and Thoughts* (1906), *The Creed of a Layman* (1907), and *The Philosophy of Common Sense* (1908), *Among my Books* (1912), *On Society* (1918), *Novissima Verba* (1920). He died 14th January 1923.

Harrison, JOHN, inventor of the chronometer, was born near Pontefract, Yorkshire, in 1693. His genius led him early to study the construction of clocks and watches, with a view to diminish as much as possible their errors and irregularities, and by 1726 he had constructed a timekeeper provided with compensating apparatus for correcting errors due to variations of climate. In 1714 the government had offered prizes of £10,000, £15,000, and £20,000 for the discovery of a method for determining the longitude within 60, 40, and 30 miles respectively. After a long period of persevering labour Harrison made a chronometer which, in a voyage to Jamaica in 1761-62, was found to determine the longitude within 18 miles. After another voyage to Jamaica, and further trials, he was awarded the prize of £20,000 in 1765 and 1767. The success of Harrison's chronometer is owing to the application of the compensation curb to the balance wheel; and on the same principle he invented the gridiron pendulum for clocks. Besides these, he invented the going fusee and the remontoir escapement (see HOROLOGY). Harrison died in London, 24th March 1776. He wrote *Description of such Mechanism as will afford a Nice or True Measurement of Times*. See *The Principles of Mr Harrison's Timekeeper* (1767).

Harrison, THOMAS, regicide, was born at Newcastle-under-Lyme in 1606, and joined the parliamentary army at the opening of the Civil War. He commanded the guard that carried the king from Hurst Castle to London, sat among his judges, and signed his death-warrant. He did good service at Worcester, but was too uncompromising alike in religion and politics to favour Cromwell's tolerant ideas, and was accordingly deprived of his commission, and later imprisoned for his share in some of the plots hatched by the more irreconcilable bigots. With characteristically stubborn heroism he would not fly at the Restoration, and was soon seized, tried, and condemned to death. He died bravely, October 13, 1660, with the words on his lips, 'If I had ten thousand lives, I could freely lay them all down to witness to this matter.' See works by Firth (1893) and Simpkinson (1905).

Harrison, WILLIAM, chief of Holinshed's coadjutors, was born in London in 1534, educated at St Paul's and Westminster, and studied first at Oxford, next at Cambridge, graduating B.D. at the latter in 1569. He became household chaplain to William Brooke, Lord Cobham, who presented him to the rectory of Radwinter, in Essex, which he held all his life, together for ten years with the vicarage of Wimbish in the same county. In 1586 he was installed canon of Windsor, and died in 1593. Almost all we know of him he has told us himself, even to his gardening and his brewing; and he impresses his readers throughout as a learned, honest, and singularly open-eyed although untravelled man. When he wrote the book by which his name is remembered one Trinity term in London, he was more than forty miles from his books, and he tells us further that till recently, except in visits to the universities or to Lord Cobham's house in Kent, he had never gone a forty miles' journey in his life. But at that time he had the advantage of access to the valuable manuscripts

of Leland. The fruit of his application was his famous *Description of England*, as well as his *Description of Britain*, written for Holinshed's *Chronicle*. In the 'Epistle Dedicatorie' he tells us he had an 'especial eye unto the truth of things;' and further that he was 'the first that hath taken upon him so particularly to describe this Ile of Britain.' The former is especially interesting to us as a vigorous and elaborate account of the conditions of life in the England of Shakespeare's day, treating in succession, with some fullness of detail, subjects so diverse as the church, the bishoprics, the universities, the navy, the food, apparel, armour, the beggars and rogues, laws, punishments, buildings, cities, parks, gardens, fairs, and markets. The second and third books of the *Description of England* were edited by Dr Furnivall, for the New Shakespeare Society (parts i.-iii. 1877-81). The whole work is of course reprinted in all editions of Holinshed.

Harrison, WILLIAM HENRY, ninth president of the United States, was born in Charles City county, Virginia, 9th February 1773. His father, Benjamin Harrison (1740-91), was one of the signers of the declaration of independence, which, as chairman of committee, he reported to congress on 4th July 1776. There is a popular legend, seemingly unfounded, that makes the family descended from Harrison the regicide. After his father's death, William joined the army which Wayne was leading against the North-western Indians, and showed great gallantry at the battle on the Miami (1794). He left the army in 1798. He represented the North-west Territory as a delegate in congress in 1799-1800, and succeeded in passing a valuable law relating to the sale of the federal land in small parcels; and when Indiana Territory was formed (1800), including the present states of Indiana, Illinois, Michigan, and Wisconsin, besides parts of Minnesota and Ohio, he was appointed its governor. He laboured courageously to avert war with the Indians, but was compelled to quell Tecumseh's outbreak, and beat off a fierce and treacherous attack, ending in an important battle at Tippecanoe (7th November 1811). In the war of 1812-14 he was appointed to the chief command in the north-west, repulsed the British force under Proctor, and by the victory of Perry on Lake Erie was enabled to pursue the invaders into Canada, where, on 5th October 1813, he totally routed them in the battle of the Thames. In 1814 he resigned his commission. In 1816 he was elected to congress, and in 1824 became a United States senator. In 1828 he went as ambassador to Colombia, but was recalled in 1829, and for twelve years was clerk of a county court in Ohio. He received 73 electoral votes for the presidency of the United States in 1836 against Van Buren's 170; but four years later, the Whig party having united, he defeated Van Buren, obtaining 234 electoral votes to the latter's 60. The contest is noteworthy as having witnessed the introduction of the enormous mass-meetings and processions, the emblems and banners, that have since been part of every presidential campaign. Harrison died a month after his inauguration, on 4th April 1841, and was succeeded in office by the vice-president, John Tyler.

Harrogate, or HARROWGATE, a watering-place in the West Riding of Yorkshire, lies among the moors, 450 feet above sea-level, and by rail is 13 miles N. of Leeds and 19 WNW. of York. It consists of two parts, High and Low, and is celebrated for its sulphureous, saline, and chalybeate springs. 'The sulphureous springs are of laxative and diuretic quality, while the chalybeate are tonic. The waters are used both externally and internally, and are in great repute

in many diseases of the skin and in some cases of dyspeptic disorders, gout, jaundice, rheumatism, &c. The springs were discovered in 1596, and about 250,000 treatments are given a year. The 'Stray' (200 acres) and 'Bog Valley' are fine open parks. Harrogate, a municipal borough from 1883, was extended in 1900. Smollett's *Humphrey Clinker* (1771) gives a lively account of it. Pop. (1851) 3678; (1891) 13,917; (1911) 33,703; (1921) 38,938. See books by Grainge (1871) and Fletcher (1920).

Harrow, an agricultural implement used for smoothing and pulverising ploughed land, and for covering the seeds previously sown. It consists of a frame of a square or rhombic form, in which are fixed rows of teeth, or *tines*, projecting downwards. The harrow is a very ancient implement, having been in use beyond the dawn of history; but as in early times only the lighter soils were cultivated, it often consisted of bushes, or branches of trees, which merely scratched the ground. Subsequently, we find a wooden frame and wooden tines in use; next, the wooden frame with iron tines, a form of the instrument still in use in some districts, especially upon light soils. The harrow constructed wholly of iron is now most largely employed, and as it can be made light or heavy, works more cleanly, and is more durable, it is preferable to the old wooden form. Iron harrows are usually made in zigzag form as shown below. Most modern forms have the tines so arranged that no one follows in the track of another, but each has a separate line of action, which greatly diminishes the risk of any

Zigzag Harrow.

portion of the surface escaping pulverisation. Exceptionally strong harrows with long curved teeth are made for breaking down rough or hard land. The 'chain-harrow,' which is a congeries of iron rings, is useful for covering grass-seeds, and especially for separating weeds from the earth or clods in which they are enveloped. Drill harrows are constructed to scarify the soil between raised drills and also the raised drills themselves. In recent years many modifications have been introduced for special purposes. In the spring-tined type the rigid vertical teeth are replaced by curved and non-rigid tines; in the lever harrow the angle of the tines to the framework can be altered so as to give a greater or lesser tearing action; and in the disc harrow the teeth are replaced by sharp saucer-shaped cutting-discs, which revolve at a slight angle to the line of draft as the implement is moved. In the larger types of harrows, which are drawn by tractors, a self-lift mechanism is added.

Harrow, or **HARROW-ON-THE-HILL**, a town of Middlesex, $11\frac{1}{2}$ miles WNW. of St Paul's, stands on a hill, 200 feet high, that looks over thirteen shires. St Mary's Church, which crowns the hill-top, was founded by Lanfranc, and rebuilt about the middle of the 14th century. Exhibiting every style of Gothic architecture, from Norman to Perpendicular, it has a lofty spire and fine monuments

(one of them to John Lyon); while in the churchyard is a flat tombstone on which Byron as a schoolboy used to lie. Pop. (1881) 5558; (1911) 17,074; (1921) 19,468. The district has increased even more rapidly, owing largely to building operations and to the railway improvements.

HARROW SCHOOL was founded in 1571 by John Lyon, a wealthy yeoman of Preston, in the parish of Harrow-on-the-Hill, who died in 1592; but the original red-brick school-house (now the name-bearcarved Fourth Form School) was not built till 1608-15. New buildings have been added since 1819—the chief of these being the Second-pointed chapel (1857), with its tall slender spire and memorial glass to twenty-two Crimean officers; the Vaughan Memorial Library (1863), the semi-circular Speech-room (1877), the Butler Museum near the chapel, the science school extensions, and the War Memorial buildings. The school was primarily intended to afford a free education to thirty poor boys of the parish; but the statutes, drawn up by the founder two years before his death, provided also for the admission of 'so many foreigners as the place can conveniently contain;' and it is to that provision that Harrow, although not richly endowed, owes its proud position among the great schools of England. Still, its fortunes have fluctuated much, the number of boys being 144 in 1721, 50 in 1745, 345 in 1803, 80 in 1845, 438 in 1859, and now about 600. The study of mathematics was first introduced in 1837, of modern languages in 1851-55; and all the other branches of a modern education have followed. The playing-fields are very fine and extensive. Harrow has an Officers' Training Corps. The age of admission is twelve to fourteen. Of leaving scholarships, the most valuable are valued at £150 a year. Under the Public Schools Act of 1868 the governing body comprises six members, elected respectively by the Lord Chancellor, the universities of Oxford, Cambridge, and London, the Royal Society, and the under-masters. Among the twenty-one head-masters have been Archdeacon Thackeray (1746-60), Dr Sumner (1760-71), Dean George Butler (1805-29), Archbishop Longley (1829-36), Dean Vaughan (1844-59), Dr Henry Montagu Butler (1859-85). Of illustrious Harrovians may be mentioned Lord Aberdeen, Bruce the Abyssinian, Charles Buller, Colonel Burnaby, Lord Byron, Charles Stuart Calverley, the Marquis of Dalhousie, Lord Dalling, Lord Goderich, the Marquis of Hastings, Lord Herbert of Lea, Theodore Hook, Sir William Jones, Cardinal Manning, Hermann Merivale, Dean Merivale, Lord Palmerston, Dr Samuel Parr, Sir Robert Peel, Spencer Perceval, Admiral Rodney, Lord Shaftesbury, Sheridan, J. S. Symonds, Archbishop Trench, Anthony Trollope, and Sir George Trevelyan. 'Stet fortuna domus.'

See R. Pitcairn, *Harrow School* (1870); Bushell, *Early Harrow Charters* (1893); Howson and Warner, *Harrow School* (1898).

Harry, **BLIND**, a Scottish minstrel of the 15th century. Scarcely anything is known of his life beyond what is told by John Major (or Mair) in his *History of Scotland*, published in 1521. 'When I was a child,' he says, 'Henry, a man blind from his birth, who lived by telling tales before princes and peers, wrote a whole book of William Wallace, weaving the common stories (which I, for one, only partly believe) into vernacular poetry, in which he was skilled.' In 1490-92 Blind Harry is found at the court of King James IV., receiving occasional gratuities. The poem attributed to him, *The Life of that Noble Champion of Scotland, Sir William Wallace, Knight*, was completed before the end of the year 1488, when it was copied by John Ramsay. This copy, the only old MS. of the work known to

exist, does not ascribe it to Blind Harry, nor is his name given to it in the earlier printed editions. The poem, which contains 11,861 lines, of ten syllables each, is written in rhyming couplets. The language is frequently obscure, and sometimes unintelligible, but the work as a whole is written with vigour; in some passages it kindles into poetry; and it is altogether a surprising performance, if we regard it as the composition of one who was born blind. The author seems to have been familiar with the metrical romances which were the popular literature of the time, and, though his poem has no claim to be regarded as history, he makes frequent references to original authorities which form the main groundwork of the narrative. He represents himself as deeply indebted to the life of the great Scottish patriot, written in Latin by his schoolfellow Master John Blair, the chaplain of Wallace, and to another by Sir Thomas Gray, the parson of Liberton. The poem contains a great number of mistakes or misrepresentations of well-known facts, and some of the achievements of Bruce are transferred to its hero; but it offers in not a few incidents a trustworthy narrative. The work is believed to have been printed in the Scottish capital as early as 1520, but no perfect copy is known to be preserved of any earlier edition than that of Edinburgh in 1570. A score or more of reprints appeared before the end of the 18th century at Edinburgh, Glasgow, Aberdeen, Perth, and Belfast. Good editions are by Jamieson (Edin. 1820) and by Moir (Scottish Text Society, 1885-89). The work was for 200 years eminently popular in Scotland, but fell into neglect as its language ceased to be understood except by scholars. A modernised version by Hamilton of Gilbertfield (1722), though a poor performance, was much read by the Scottish people.

Hart, male Red Deer (q.v.) or stag from the age of six years.

Hart, SIR ROBERT (1835-1911), born at Milltown, County Armagh, was educated at Wesley College, Dublin, and Queen's College, Belfast, and entered H.B.M. consular service in 1854. In 1858, when attached to the consulate at Canton as interpreter, he obtained leave to take service in the Chinese Maritime Customs, which ere long he completely reorganised and transformed into a complex organisation which increased the Chinese revenue, lighted coasts and rivers, maintained its own revenue cruisers, and helped to establish a European university in Peking. From 1863 to 1908 he was chief inspector of maritime customs, and in many important negotiations he served the Chinese government loyally, spite of not a little ingratitude and discourtesy. He was G.C.M.G. and baronet, and held many Chinese and other orders. In 1901 he wrote *These from the Land of Sinim*.

Hart, SOLOMON ALEXANDER (1806-81), painter, was born at Plymouth in April 1806, the son of a Jewish goldsmith, who in 1820 removed to London. Amongst his works are 'The Elevation of the Law' (1830), 'Milton visiting Galileo in Prison' (1847). In 1840 he became R.A., and in 1854 professor of Painting.

Harte, FRANCIS BRET, was born in Albany, New York, 25th August 1839, son of a teacher (Jewish on the father's side) who died early, and the boy received only a common school education. He went to California with his mother in 1854, and opened a school at Sonora; but he was not successful in this, nor in mining, which he tried afterwards. He next became a compositor, and in 1857 obtained employment in the office of the *Golden Era*, in San Francisco. His experiences among miners and the rough population that were attracted by the 'gold-craze' had made a powerful impres-

sion upon his mind, and his first literary efforts were sketches of the people and the scenes he had observed. These sketches attracted much attention, and as a result the author became one of the staff of the paper. His *Condensed Novels* afterwards appeared in another weekly, the *Californian*. He was secretary of the United States Mint in San Francisco from 1864 to 1870, and during this period wrote some of his most famous poems, among them 'John Burns of Gettysburg', 'The Society upon the Stanislaus,' &c. He founded in 1868 and edited the *Overland Monthly*, to which he contributed *The Luck of Roaring Camp*, *The Outcasts of Poker Flat*, *Miggles*, *Tennessee's Partner*, *The Idyl of Red Gulch*, and *Plain Language from Truthful James* ('The Heathen Chinese'). Returning to the east, he became a contributor to the *Atlantic Monthly*, and from time to time delivered lectures in various cities upon the pioneers of California. In 1878-80 he was United States consul at Crefeld, in 1880-85 at Glasgow. Later he lived in or near London, and dying 5th May 1902, was buried at Frimley in Surrey. There are Lives by Pemberton (1903) and Merwin (1912).

Bret Harte was a prolific writer, and almost everything from his pen bears the stamp of his original genius. This, however, is truer of the early and middle period than of the later. Generally, he is strongest in the field of which he was the discoverer; although in some instances—notably in *Thankful Blossom*—he has produced exquisite romances, sometimes with a pastoral flavour, wholly unlike the turbulence of the first efforts.

The mixture of southern and western people in the early rush to the goldfields seems to have produced a new dialect, but it probably had a brief existence. At least, it would be wrong to suppose that the peculiar phrases in the mining sketches are part of the daily talk of the people to-day. But the dialect was not all. Harte described or invented new types of character, and portrayed them and their surroundings with a vivid energy that had no counterpart. It is difficult to say whether he was more successful in poetry or in prose; for the same virile power appears in both, and he had evidently by nature a strong sense of melody and great facility in verse. In 'John Burns of Gettysburg' and 'Dickens in Camp' there is evidence that he might have taken a higher place among poets if he had devoted himself to serious work; and he could write prose romances distinguished by gentle and refined feeling. But the foremost characteristic of his achievement is his rich and abundant humour. He had no earlier model; many soon followed him—afar.

See his *Life* by H. C. Merwin (1912). A collected edition of his *Writings* (19 vols.) appeared in 1900-4. Separate publications were *Flip* (1882); *In the Carquinez Woods* (1883); *By Shore and Sedge* (1885); *Snowbound at Engle's* (1886); *A Phyllis of the Sierras* and *A Drift from Redwood Camp* (1888); *Cressy* (1889); *The Heritage of Dedlow Marsh* (1889); *A Way of the Plains* (1890); *A Ward of the Golden Gate* (1890); *A Sappho of Green Springs* (1892); *Sally Dows* (1892); *Susy* (1893); *The Bell-Ringer of Angel's* (1894); and *Clarence* (1895).

Hartebeest, the Boer name for a South African antelope (*Bubalis cama*), characterised by its red colour. The name has been extended to include members of the same genus all over Africa. See ANTELOPE.

Hartford, the capital of Connecticut, is situated on the right bank of the Connecticut River, 50 miles from its mouth, and 112 by rail N.E. of New York, with which it is also in daily communication by steamboat. It is a handsome city, with streets not all too regular, and many tasteful private houses. It has an imposing state capitol of white marble, surrounded by the 50-acre Bushnell Park,

the city's most attractive feature; on the outskirts are the new buildings of Trinity College (Episcopal), which was founded on the present site of the capitol in 1823 (see GLENALMOND). To the notable public buildings, besides the Wadsworth Athenæum and the high school, must be added the substantial offices of the many great insurance companies whose headquarters are established here, as well as a number of banks. Hartford contains a Congregational theological seminary, a large hospital, asylums for orphans, the deaf and dumb, and the insane, and possesses several important libraries and other public institutions. It is the seat of a Roman Catholic bishop. There are extensive manufactures of Colt's pistols, Gatling guns, engines, boilers, and machines, hardware and silver-plated goods, stoneware, and wooden wares. There is also some publishing, and a very considerable trade in Connecticut tobacco. The site of a Dutch fort in 1633, and of a colony of Massachusetts settlers as early as 1635-36, Hartford was incorporated as a city in 1784, and has been sole capital of the state since 1873. It was the seat of the Hartford Convention (q.v.). See also CONNECTICUT. In point of population the city stands second to New Haven, which formerly shared with Hartford the rank of semi-capital. Pop. (1870) 37,180; (1890) 53,230; (1900) 73,850; (1910) 98,915; (1920) 138,036. See *The River Towns of Connecticut*, by C. M. Andrews (Johns Hopkins University Studies, 1889).

HARTFORD CONVENTION, in the political history of the United States, was an assemblage of delegates from the New England States, at Hartford, Connecticut, December 15, 1814. This convention was proposed by the Massachusetts legislature. The war with Great Britain in 1812-14 had been from the first opposed by the majority of the people of New England, who were Federalists, and looked upon the war as a mere party measure of the Democrats; and in face of the destruction of the commerce and the fisheries, the chief interests of New England, this convention was called with the ostensible object of devising means of security and defence. It sat twenty days with closed doors, and, as it was supposed to be of a treasonable character, it was watched by a military officer of the government. The convention prepared a report recommending the adoption of measures by the state legislatures that would protect their citizens from conscriptions and impressments, and the militia from forcible drafts; the report also proposed certain amendments to the federal constitution. No treasonable act was committed, and no treasonable intention proved; yet the suspicion of disloyal tendencies clung to the convention, and completed the ruin of the Federalist party, which did not survive the election of 1816. Some ground for the public suspicion was probably afforded by the fact that a section of the Federalist leaders known as the 'Essex Junto,' who had in 1804 and 1809 seriously discussed the question of dissolving the Union and forming an Eastern confederacy, were foremost in bringing the convention about; and the charge of aiming at a kingdom of New England would therefore make no serious demand upon the credulity of partisan opponents. Yet the convention included men of the highest public character, who strenuously defended the pure purpose of its patriotism, and the charges of treasonable designs are now nearly universally regarded as baseless.

Hartington, LORD. See CAVENDISH.

Hartlepool, a municipal borough and seaport in the county of Durham, is situated on a small peninsula north of the estuary of the Tees, 12 miles NNE. of Stockton, and 18 ESE. of Durham. It formerly attracted many visitors for sea-

bathing during the summer months; but, owing to the formation of railways connecting it with the Durham coal-mines, it is no longer visited for that purpose. Its ancient sea-fishing industry is retained, and has recently extended in consequence of the demand from Yorkshire. It is the only borough in the county founded by royal charter whose charter is extant. In the 13th century Hartlepool belonged to the Bruces of Annandale in Scotland, progenitors of the royal family of that name. After Bruce ascended the Scottish throne his English possessions were forfeited, and Hartlepool was granted to the Cliffords. The boundaries of the ancient borough were in 1883 extended so as to include the township of Throston and part of the township of Stranton, making the southern boundary continuous with the modern borough of West Hartlepool. The local industries of Hartlepool are iron shipbuilding, marine engineering, and cement-manufacture. Formerly there was a considerable shipping trade, but that is now almost entirely transferred to West Hartlepool, where the chief custom-house and other facilities are situated. The harbour entrance is safe, and communicates by a channel direct to the more modern port. The public institutions include excellent public schools, a public hospital, an ancient parish church (St Hilda's), and other places of worship. St Hilda's church was injured by German shells in 1914, part of the tower being carried away. A substantial sea-wall and delightful promenade, completed in 1889, added much to the attractive appearance of the town on the seaward side. Pop. of municipal borough (1851) 9503; (1871) 13,166; (1881) 16,998; (1901) 22,737; (1911) 20,615; (1921) 20,961.

WEST HARTLEPOOL, a municipal and county borough and seaport, is situated to the south as Hartlepool is to the north of Hartlepool Bay, and practically forms one town with Hartlepool. 'The Hartlepoons' stand high among the ports in timber importation, and they are one of the chief ship-owning towns in the North. A large fishing trade is also carried on. The offices of the large iron and steel and shipping works are fine buildings. A dock is named after R. Jackson, one of the earliest men to see the future of the town. The dock area of Hartlepool and West Hartlepool together, including the timber and shipbuilding yards, &c., is over 350 acres, and there is good warehouse accommodation. Extensive iron shipbuilding yards, cement-works, wood-pulp works, and marine engine-building establishments have been founded. There are graving-docks leased by the London and North-Eastern Railway Company, and also one extensive graving-dock open to public use. Besides timber, the following are the imports: Sugar, cheese, grain, butter, and iron and copper ores. The chief export is coal (amounting annually to over two million tons), followed by ships, machinery, earthenware, iron, and woollen and cotton goods, the trade being carried on for the most part with Baltic and North Sea ports. Governed from 1854 by a local commission, the town was created a municipal borough in 1887. Pop. of municipal district (1861) 12,603; (1881) 28,167; of municipal borough (1911) 63,923; (1921) 69,689. In 1867 'The Hartlepoons' were constituted a parliamentary borough, returning one member. Pop. (1921) 89,650. See Sir C. Sharpe's *History of Hartlepool* (1816; new ed. 1851).

Hartley, DAVID, philosopher, was born in June 1705. His father was vicar of Armley, in Yorkshire. At fifteen he entered Jesus College, Cambridge, and became a Fellow of the college. He studied at first for the church, but, dissenting from some points in the Thirty-nine Articles, he abandoned his original intention. In his mature years

he impugned the eternity of hell-punishment, maintaining the ultimate restoration of the lost; in all other points his published opinions coincided with the Church of England, and he continued to the last a member of the church. He finally chose the profession of medicine, in which he attained considerable eminence. He practised as a physician successively at Newark, Bury St Edmunds, in London, and at Bath, where he died on the 25th of August 1737, at the age of fifty-two.

His work on the mind, entitled *Observations on Man* (1749), on which his fame rests, was begun when he was about twenty-five, and occupied his thoughts for sixteen years. The first part relates to the constitution of the human mind; the second treats of religion and morals. His handling of the mind turns throughout upon two theories or hypotheses, which have very different merits. The first is called the Doctrine of Vibrations, or a theory of nervous action analogous to the propagation of sound, the suggestion of which he owed to Newton, of whose writings he was a devoted student. His second and most valuable innovation consisted in showing that the faculties, powers, and feelings of the mind might be explained to a very wide extent by the principle of the Association of Ideas (q.v.); and it should be said that he was certainly the first to do justice to the applications of that principle to explain the phenomena of the mind.

The doctrine of vibrations supposed that when any one of the senses is affected by an outward object the effect was to set the particles of the nerve in a vibratory motion, which ran along to the brain, and produced corresponding vibrations in the cerebral substance. In like manner, when an active impulse proceeded outwards to the muscles the manner of communication along the nerves was of the same kind. He even extended these molecular vibrations to the other tissues. The dislike generally entertained towards this part of Hartley's speculations arose from a mistaken notion of its involving or favouring materialism. See G. S. Bower, *Hartley and James Mill* (1881).

Hartlib, SAMUEL, was born about 1600 at Elbing, in Prussia, son of a Polish refugee and an English mother. Coming to England about 1628, he busied himself in trade, later in agriculture, and, when he had exhausted his fortune in his experiments, projected a school to be conducted on new principles. It is highly probable that his idea inspired his friend Milton's famous *Treatise on Education*, addressed to Hartlib in 1644, as well as Sir William Petty's *Two Letters* (1647 and 1648). He was granted by Cromwell a pension of £100, increased later to £300, which after the Restoration he petitioned parliament to renew. No letters of Hartlib's are extant posterior to 1662. He wrote on education and on husbandry. See Lives by H. Dircks (1865) and Turnbull (1920).

Hartmann, ALFRED, a Swiss author, was born 1st January 1814 at Langenthal, Bern. He studied law at Munich, Heidelberg, and Berlin, but afterwards devoted himself to literature. His best-known works are *Meister Putsch und seine Gesellen* (1858); a life of his friend Martin Disteli the artist (1861); a life of H. J. von Staal (1861); *Galerie berühmter Schweizer* (2 vols. 1863-71); *Die Denkwürdigkeiten des Kanzlers Hory* (1876). Among his other works are *Erzählungen aus der Schweiz* (1863), *Junker und Bürger* (1865), *Schweizer-novellen* (1877), *Neue Schweizer-novellen* (1879), and *Fortunat* (1879). He died in 1897. A Life by Arx appeared in 1902.

Hartmann, JAKOB FREIHERR VON, a German soldier, born at Maikammer, in the Palatinate, in 1795, was trained in the French military schools of Bonn and Saint Cyr, served in 1814-15 against the

Allies, and entered the Bavarian army in 1816. He fought against Prussia in 1866, but lived to command the Bavarian Second Army Corps in the Franco-German war, and took a prominent part in the battle of Sedan. He died in 1873.

Hartmann, JOHAN PEDER EMILIUS, who ranks among the first of Danish composers, was born at Copenhagen in 1805. His father and grandfather were also distinguished musicians. He was a teacher in the Conservatory in 1827, became a director in 1840, and royal chapel-master in 1849. From 1839 to 1892 he was president of the Musical Association of Copenhagen. His published works are numerous, and include the operas, *The Raven, or Brotherly Proof* (1832); *The Golden Horns* (1834); *The Corsairs* (1835); and *Little Christina* (1846). He composed the music for dramas by Andersen, Oehlenschläger, and Heiberg; numerous songs and song-cycles; besides a good deal of music for piano and violin, &c. He died in 1900.

Hartmann, KARL ROBERT EDUARD VON, German philosopher, born at Berlin on 23d February 1842. From 1858 to 1865 he served as an artillery officer in the Prussian Guards, but was compelled to abandon his calling owing to an affection of the knee. From 1867 he lived in Berlin, busied with the elaboration of a comprehensive system of philosophy. His activity may be divided into two periods; in the first, from 1868 to 1877, he was chiefly working out his ideas on methodology, the philosophy of the natural sciences, psychology, metaphysics, and the theory of knowledge (*Erkenntnistheorie*); in the latter, from 1878 onwards, he was chiefly concerned with ethics, the philosophy of religion, and aesthetics. His system is a synthesis of Hegel's and Schopenhauer's systems, which he reduced, by means of Schelling's conception of the Unconscious and his doctrine of principles, to a concrete monism; and his substructure is built upon an empirical basis with the aid of the inductive methods employed in the natural sciences and history.

The great aim Eduard von Hartmann set before himself was that of harmonising and reconciling philosophy with science, by gathering up the varied results of modern scientific investigation into an all-comprehensive philosophic conception of the world (*Weltanschauung*). His speculative system is commonly believed to be pessimistic in temper; but that is not the case. The Unconscious (the universal monistic principle) is both real and ideal, both will and presentation—the substantial and intelligent principles respectively. And the world-process, instead of being negative, is a process of evolutionary optimism. The substantial principle involves intrinsically an excess of pain over pleasure in the world; and this excess of pain can only be abolished by the annihilation of the substantial principle, Will, and its specific energy, willing, not, however, in individual beings, but once for all universally. The agency by which this 'best possible' consummation is to be achieved is the intellectual principle, working through its own creations, consciousness and individuality, along the lines of progressional development. And this strikes the keynote of the philosophic temper in which Von Hartmann wrote. He was an ardent champion of evolutionary progress, a believer in the mission of western energy and enlightenment, and in its teleological justification, an admirer of the modern spirit of enterprise, its robust vigour, its keen delight in struggle and conflict, and its restless practical activity. Hence he proclaimed himself as opposed to the teaching and attitude of the prophets of the *Weltschmerz*; hence he condemned the temper of oriental passivity, the unmanly

fashion of cowering and shivering before the March blasts of misery, and despised that 'weariness ere eventide' which had become so common amongst us. He died 6th June 1906.

Ed. von Hartmann also gave close attention to the public questions of the day in Germany, and wrote ably and clearly on such matters as education, politics, &c. The results of his activity in these departments will be found in *Zur Reform des höheren Schulwesens* (1875), *Die politischen Aufgaben und Zustände des Deutschen Reichs* (1881), *Moderne Probleme* (1885), *Gesammelte Studien und Aufsätze* (1876)—this last containing an autobiography—and *Zwei Jahrzehnte Deutscher Politik* (1889), besides numerous contributions to magazines, such as *Die Gegenwart*, &c.

The books in which his philosophical creed is laid down bear the following titles: *Philosophie des Unbewussten* (1869; 11th ed. 1904; Eng. trans. by Coupland, 1884); *Phänomenologie des sittlichen Bewusstseins* (1879; 2d ed. 1886); *Das religiöse Bewusstsein der Menschheit im Stufengang seiner Entwicklung* (1882); *Die Religion des Geistes* (1882); *Die Deutsche Aesthetik seit Kant* (1886); and *Die Philosophie des Schönen* (1887). Besides these, he wrote several books supplementary to his principal lines of thought, such as *Kritische Grundlegung des transcendentalen Realismus* (3d ed. 1885); *Neukantianismus, Schopenhauerianismus, und Hegelianismus* (3d ed. 1910); *Die Selbsterziehung des Christentums und die Religion der Zukunft* (2d ed. 1874; Eng. trans. by Dore, 1886); a work on the theory of knowledge (1899); *Kritische Wanderungen durch die Philosophie der Gegenwart* (1890), &c. A selection from his works (13 vols.) appeared in 1885-1901; his *System der Philosophie in Grundriss* (8 vols.) in 1907-9. Useful helps to the study of his system are Koeber's excellent condensation, *Das philosophische System H. von Hartmanns* (1884), and works by Plumaehor (1884 and 1890), A. Drews (1890 and 1906), and J. M. Baldwin (1901-5).

Hartmann von Aue ranks next after Wolfram von Eschenbach and Gottfried von Strassburg as a poet of the Middle High German period. He was born about 1170, of a noble Swabian family, took part in the Crusade of 1187, and died between 1210 and 1220. His writings consist of narrative poems and songs. The most popular of the former is *Der arme Heinrich*, based upon a Swabian traditionary story. *Erec*, which relates the legend reproduced in Tennyson's 'Enid' in *Idylls of the King*, and *Iwein*, are both drawn from the Arthurian cycle, and closely follow French poems by Chrestien de Troyes. In *Gregor vom Steine* Hartmann depicts worldly passion subdued and purified by the power of religious faith, the faith of the ascetic of the church at that date. The songs belong to the erotic class, and are marked by freshness and naïveté. F. Bech published a critical edition in 1866-69 (3d ed. 1891-93); and see books by Rötteleken (1887), Saran (1889), and Schönbach (1894).

Hartshorn, the term given in pharmacy to the antlers of the Red Deer or *Cervus elaphus*. Its composition is very different from that of persistent horns, as those of the ox, for example, and is identical, or nearly so, with that of bone. The products of its distillation, containing among other things, ammonia, were formerly much used in medicine, under the titles of oil of hartshorn, volatile salt of hartshorn, spirits of hartshorn, &c.; but they are now replaced by a solution of ammonia and carbonate of ammonia, the sal volatile of the shops. See AMMONIA, LINIMENTS.

Hart's-tongue (*Scolopendrium*), a genus of widely distributed ferns, of which one species, *S. vulgare*, is a native of Britain, and is common in many parts of the country, in moist woods, shady banks, caves on the seashore, and other cold and damp situations. Its fronds are in general undivided—although sometimes forked—from a few inches to 2 feet in length, and from 1 to 3 inches in

breadth. The *sori* are in transverse lines on the lateral veins. Fine plants of this fern are very

Hart's-tongue (*Scolopendrium vulgare*).

ornamental, and attain their greatest luxuriance in winter.

Hartz. See HARZ.

Hartzenbusch, JUAN EUGENIO, a Spanish dramatic poet of German extraction, was born at Madrid, September 6, 1806, studied under the Jesuits, and produced his first book, the drama *Amantes de Teruel*, in 1836. His principal works, all published at Madrid, are the drama *Doña Mencía* (1838), the comedies *La Redoma Encantada* (1839) and *La Visionaria* (1840), and the dramatic poems *Alfonso el Casto* (1841), *El Bachiller Mendarias* (1842), *La Coja y el Encogido* (1843), and others. He also published in prose *Cuentos y Fábulas* (1861), *Obras Escogidas* (1865), and *Obras de Encargo* (1864). His writings are characterised by glowing imagination, vigorous diction, and sonorous versification. Besides his original works he issued good critical editions of the plays of Tirso de Molina, Calderon, and Lope de Vega. During the greater part of his life Hartzenbusch was employed in the national library at Madrid, of which he became director in 1862. He died at Madrid, 3d August 1880.

Hārūn. See HAROUN.

Haruspices (cf. Sanskrit *hira*, 'entrails'; Gr. *chordē*, *cholades*), soothsayers or diviners among the Etruscans, and from them adopted by the Romans, who foretold future events from the inspection of the entrails of animals offered in sacrifice (hence also called *extispices*), and from the observation of other circumstances connected with the offerings, such as the willingness or unwillingness of the victim to come to the altar, and the flame or the smoke. They took indications also from earthquakes, lightning, and all other extraordinary phenomena of nature called *portenta*. The haruspices did not equal the augurs in dignity and respect; they were regarded rather as mediums of communication with heaven than as possessing any independent religious authority. They had no organisation like the augurs; they did not, in earlier times at least, form a *collegium*, nor had they a *magister*. Their art fell latterly into disrepute, as is illustrated by the well-known saying of Cato that 'he wondered that one haruspex did not laugh when he saw another.' See AUGURIES, and DIVINATION.

Harvard University, founded as a college in 1638, is the oldest, and one of the best equipped of the institutions of learning in the United States. It is located at Cambridge (q.v.), Massachusetts, and its numerous buildings (about sixty) are the chief features of the town. It was named in honour of the Rev. John Harvard, who was born in Southwark in 1607 (see letter on a commemoration in *Athenæum*, 3d June 1905), graduated in 1635 at Emmanuel College, Cambridge, came to New England

in 1637, and, dying in 1638, bequeathed to the proposed college his library of over 300 volumes and £779. During the colonial period the avowed object of Harvard College was 'the education of the English and Indian youth in knowledge and godliness,' mainly with a view to their entering the Puritan ministry: only one Indian ever graduated (in 1665). In its infancy the college was supported by voluntary contributions from the churches, and by grants from the Massachusetts colony, but for a long time it was a rather obscure and feeble school. Its expansion into a university, its deliverance from sectarian control, and its independence from the state were all accomplished during the 19th century. During the same period its resources enormously increased, and this almost wholly from private donations. It was mainly under the rule of the state until 1865, when by statute the government was vested in a board of thirty overseers, in six classes of five members each, chosen by the alumni; one class being renewed annually. The overseers direct the courses of study and general management, but the nominations of professors and other officers are made by the 'corporation,' consisting of the president and five fellows, a self-perpetuating body, originally created by charter in 1650, and holding all the property of the university as trustees. The nominations made by the 'corporation' require confirmation by the overseers.

The halls for 'recitations' and lectures, and for students' lodgings, as also the chapel, library, and law-school, are in a square called the college yard, containing about 15 acres, planted with beautiful elms. The other buildings are in other parts of the town, not far distant, and occupy about 60 acres. The Agassiz museum of comparative zoology is world-famous. The Peabody museum of American archaeology and ethnology dates from 1866, and completes the university museum buildings. The most imposing edifice is Memorial Hall, built in honour of the alumni who fell during the civil war. The principal hall is 164 by 60 feet, and 80 feet to the ceiling. This has a fine collection of historical portraits. It is used as a dining-hall, and accommodates nearly 700 at table. At the eastern end is a beautiful theatre for public exercises on ceremonial occasions. Memorial Hall, built of brick and freestone, in Norman style, richly ornamented, needs only the mellowing touch of age to be one of the most impressive collegiate buildings in the world. The Widnes Library (1915), the Germanic Museum (1921), and several dormitories are fine additions to a university already well provided with fine buildings.

In the academic department the requirements for admission are high. The free elective system which allowed the student an almost unlimited choice of subjects was limited in 1910; and each student is required to specialise in one field of study and at the same time take a sufficient number of other courses to balance his education. No degree is given without some full course, thoroughly carried out. As the university is amply endowed, there are many scholarships in all the departments, besides prizes and aids of many sorts, amounting to over \$100,000 per annum. The university library, including the libraries of the several schools, has over two million volumes and pamphlets. The Harvard University Press was established in 1913. There is a well-equipped observatory (with a branch at Arequipa and a subsidiary station at Chuquibambilla, 7000 feet high, in a practically rainless and cloudless district, 20 miles from Calama), which has done important work, besides a botanic garden and an arboretum. There are no fees payable to professors; each student on matriculation pays a general fee, and may attend as many courses

as he elects. Since 1909 Harvard has joined with Boston University and other colleges in offering university extension lectures in Boston, an opportunity taken advantage of by increasing numbers of students.

The following are the departments included in the university: Harvard College, the Divinity School, the Law School, the Medical School, the Bussey Institution, Engineering School, School of Business Administration, Schools of Dentistry, Architecture, Public Health and Education, and a Graduate School of Arts and Sciences. Further, Radcliffe College (formerly called Harvard Annex) was organised in 1879 for the collegiate instruction of women by professors and instructors of Harvard, a four years' course preparing for a certificate corresponding to the B.A. degree. The total strength of the teaching staff is more than 1000, and of the students about 7500, less than half being at the college—the others being at the various other connected institutes or departments. The total productive endowment of Harvard University exceeds \$50,000,000. Though wholly unsectarian, the college has largely been in the hands of Unitarians. Amongst the alumni have been the Adamses, the Danas, Channing, Theo. Parker, Motley, Prescott, Bancroft, Emerson, Wendell Phillips, O. Wendell Holmes, Parkman, Lowell, Child, and Norton.

Harvest-bug. See HARVEST-MITES.

Harvest-fly, the popular name in the United States for a species of *Cicada* (q.v.).

Harvest-mites, or HARVEST-BUGS, minute mites which pass from the herbage or grass on to man, and cause intolerable itching and local inflammation. Most of them are the six-legged larval stages of species of *Trombidium*, the adults of

a, *Trombidium holosericeum*, female (mag. 9 diameters); b, larva, full grown (Harvest-mite).

which are parasitic on insects. They often enter a hair follicle or a sebaceous gland, and may work from there; they may also draw blood on the surface of the skin for a considerable time. But they soon die, as man is not an appropriate host. According to Mégnin, the *rouget* or harvest-bug, formerly called *Leptus autumnalis*, is the larva of a silky scarlet mite, *Trombidium holosericeum*, and there is an intermediate 'nymph' stage. Harvest-mites attack various mammals, such as dog and hare, but insects are their natural hosts. Relief from the irritation, to which some people are peculiarly susceptible, may be obtained by taking a warm salt bath, by applying some vaseline, sulphur ointment, some essential oil, or benzine. Flowers of sulphur or powdered naphthalene about the stockings is very effective in preventing attack. The name 'chigger' or 'jigger' is often applied in America to harvest-mites, but the true 'chigger'

is a tropical flea. In Mexico the Indians use the name *Thalsahuate* for a small irritant creature like the harvest-mite.

Harvest-moon. See MOON.

Harvey, SIR GEORGE, P.R.S.A., was born at St Ninians, near Stirling, in February 1806. He was apprenticed to a bookseller in Stirling, but in 1823 removed to Edinburgh, and entered the Trustees' Academy there. In 1826, when the Royal Scottish Academy was instituted, he was elected an Associate, though only in his twentieth year; he became a full Academician in 1829, president in 1864, and was knighted in 1867. He died 22d January 1876. Many of his works are well known through the medium of engravings. The principal are 'Covenanters' Preaching,' 'Battle of Drumclog,' 'A Highland Funeral,' 'Children blowing Bubbles in Old Greyfriars' Churchyard,' 'First Reading of the Bible in the Crypt of St Paul's,' 'Bunyan in Bedford Gaol' and 'Bunyan and his Daughter selling Laces,' 'Shakespeare before Sir T. Lucy,' 'The Curlers,' and 'Leaving the Manse.' In his later years Harvey devoted much time to landscape-painting.

Harvey, WILLIAM, the discoverer of the circulation of the blood, was born at Folkestone, in Kent, on the 1st of April 1578. His father was a yeoman; and his brothers were merchants of weight and substance, *magni et copiosi*, in the city of London. After six years at Canterbury grammar-school, Harvey, then sixteen years of age, was entered at Caius College, Cambridge. He took his degree in arts in 1597, and, after five years' study at the university of Padua under Fabricius de Aquapendente, Julius Casserius, and other eminent men who then adorned that university, he obtained his diploma as doctor of medicine in 1602. He returned to England in the same year; and after receiving his doctor's degree from his original university, Cambridge, settled in London as a physician. In 1609 he was appointed physician to St Bartholomew's Hospital, and in 1615 Lumleian Lecturer at the College of Physicians—an office then held for life; and it is now certain that in his first course of lectures (on the 17th, 18th, and 19th April 1616) he expounded those original and complete views of the circulation of the blood with which his name is indelibly associated. It was not till the year 1628 that he gave his views to the world at large, in his celebrated treatise entitled *Exercitatio Anatomica de Motu Cordis et Sanguinis*, having then, as he states in the preface, for nine years or more gone on demonstrating the subject in his college lectures, illustrating it by new and additional arguments, and freeing it from the objections raised by the skilful amongst anatomists. He was appointed successively physician to James I. and Charles I.; and in 1633 we find that his absence, 'by reason of his attendance on the king's majesty,' from St Bartholomew's Hospital was complained of, and that Dr Andrews was appointed as his substitute, 'but without prejudice to him in his yearly fee or in any other respect'—a procedure which shows the esteem in which Harvey was held. We learn from Aubrey that he accompanied Thomas Howard, Earl of Arundel, in his embassy to the emperor in 1636; and during this journey he publicly demonstrated to Caspar Hofmann, the distinguished professor of Nuremberg, and one of the chief opponents of his views, the anatomical particulars which made the circulation of the blood a necessary conclusion—a demonstration which, it is reported, was satisfactory to all present save Hofmann himself, who still continued to urge futile objections. To appreciate the importance of Harvey's discovery and the nature of the objections that would be urged against it, it is sufficient

to state that Harvey's first step was to prove that the arteries contained not air but blood. The whole course of the circulation could not be demonstrated, as Harvey had no idea of a system of capillaries uniting arteries and veins. These were discovered by Malpighi some fifty years later. He attended the king in his various expeditions, and was present with him at the battle of Edgehill (23d October 1642). He accompanied the king after the battle to Oxford, where he resided nearly four years, receiving the honorary degree of Doctor of Physic, and being elected warden of Merton College. On the surrender of Oxford to the Parliament in July 1646, he left the university and returned to London. He was now sixty-eight years of age, and seems to have withdrawn himself from practice and from all further participation in the fortunes of his royal master. During the remainder of his life he was usually the guest of one or other of his brothers, now men of wealth and high standing in the city; and it was at the country-house of one of them that Dr Ent visited him at Christmas 1650, and after 'many difficulties' obtained from him the MS. of his work on the generation of animals, which was published in the following year, under the title of *Exercitationes de Generatione Animalium*.

From this period to the time of his death the chief object which occupied his mind was the welfare and improvement of the College of Physicians. In 1654 he was elected president of the college, but he declined the office on account of his age and infirmities. In July 1656 he resigned his Lumleian lectureship, which he had held for more than forty years; and in taking leave of the college presented to it his little patrimonial estate at Burwash, in Sussex. He did not long survive, but, worn out by repeated attacks of gout, died at London on the 3d June 1657, and was buried in a vault at Hempstead, near Saffron Walden, in Essex. On 18th October 1883, at the cost of the Royal College of Physicians, his remains were removed from the dilapidated vault, and with befitting solemnity reinterred in a marble sarcophagus in the Harvey Chapel attached to the same church.

Harvey's works in Latin were published in 1766; a translation by Dr Willis in 1847 (new ed. 1881); and his *Prælectiones Academicæ* by a committee of the Royal College of Physicians in 1887. See Willis's *Life of Harvey* (1878), Huxley at the Tercentenary (*Nature*, 1878), and D'Arcy Power (1897), Miall's *Early Naturalists* (1912).

Harwich, a municipal borough and seaport in the Harwich parliamentary division of Essex, is situated on a promontory at the influx of the confluent Stour and Orwell to the sea, 71 miles by rail NE. of London. The chief industries are shipbuilding, fishing, and the manufacture of cement. There are regular lines of steamers to Antwerp, Rotterdam, Hook of Holland, &c., and a train-ferry service opened in April 1924 between Harwich and Zeebrugge. It is defended by a battery of large modern guns, and on the Suffolk side by Landguard Fort, which dates from the reign of James I. Two breakwaters prevent the harbour from becoming blocked. During the Great War Harwich was an important naval base for destroyers and other ships operating in the south of the North Sea. It is much used as a shelter in stormy weather. Pop. (1851) 4471; (1881) 7842; (1921) 13,036.

Harz Mountains, a mountain-range of Germany, extending between the rivers Weser and Elbe, south of Brunswick, with a length of 57 miles, a breadth of 20, and a superficial area of 784 sq. m. It forms an elevated plateau, rising on most sides somewhat steeply from the plains, and ridged

with irregular and in some parts forest-clad mountains. The range, which is divided into Upper and Lower Harz, the average elevations of which are 2100 and 1000 feet respectively, is composed for the most part of rocks belonging to the Devonian and Lower Carboniferous formations, and broken through in a few places by granite, as in the Brocken (q.v.), the highest peak (3740 feet) of central Germany. The Harz are exceedingly rich in metals and minerals, as silver, iron, lead, copper, zinc, marble, alabaster, and granite. These mountains form a natural line of division between the Low Germans and the High Germans. Industries connected with the mines and the forests, as well as some cattle-breeding and agriculture, afford employment to the inhabitants. The rearing of singing-birds is also a source of profit. The Harz Mountains are the scenes of many of the weird legendary tales of German literature.

Hasa, EL. See ARABIA.

Hasdrubal ('he whose help is Baal'), the name of several Carthaginian generals, of whom the most famous was the son-in-law of Hamilcar Barca (q.v.). In 237 B.C. he accompanied Hamilcar into Spain, and gave that general most effective aid in the work of building up a Carthaginian dominion in the Peninsula. On the death of Hamilcar in 228 B.C. the task of administering and extending the new empire devolved on Hasdrubal, who advanced the Carthaginian frontier from the Bætis (the Guadalquivir) to the Tagus, and founded a new capital, Nova Carthago (the modern Cartagena), a city with the best harbour on the south-east coast of Spain, and situated in the vicinity of rich silver-mines. Hasdrubal proved himself an admirable administrator. He was remarkably successful in conciliating the Iberian tribes, and extended his rule mainly by peaceful means. So independent was he of the home government that the Romans made a treaty in which the Elbro was fixed on as the frontier line, not with Carthage, but with Hasdrubal. In the eighth year of his command, 221 B.C., he was assassinated by a Celtic slave.—Another Hasdrubal was the son of Hamilcar Barca, and the brother of Hannibal (q.v.). He defeated Cneius Scipio in Spain in 212 B.C., and in 208 marched through Gaul, to join his brother Hannibal in Italy. He crossed the Alps in favourable weather, but, instead of pushing southward, made a fatal delay at Placentia, and was surprised and slain on the Metaurus in 207 B.C.—A third Hasdrubal was one of Hannibal's principal officers in the Italian campaigns. He made a brilliant charge at the battle of Cannæ, which contributed greatly to decide the fate of the day.—A fourth general of the same name defended Carthage against the Romans during the siege which ended in the city's destruction in 146 B.C. He is accused of cowardice and cruelty, and of having starved the citizens while himself living in revelry.

Hase, KARL AUGUST VON, a celebrated German theologian, was born at Steinbach, in Saxony, 25th August 1800. After being expelled from Erlangen University for his connection with the political students' unions called the 'Burschenschaften,' he became in 1823 a university tutor at Tübingen, but after a new investigation was imprisoned for ten months in the fortress of Hohenasperg. He settled at Leipzig in 1829, and in the following year was called to Jena as professor of Theology. Here he remained till his retirement in 1883, when, after sixty years of teaching, he was ennobled, and appointed a privy-councillor. His chief writings are *Des alten Pfarrers Testament* (1824); *Lehrbuch der Evangelischen Dogmatik* (1826; 6th ed. 1870); *Gnosis* (3 vols. 1826-28; 2d ed. 1870); *Hutterus redivivus* (1828; 12th ed. 1883), which was an

able attempt to present dogmatic theology in the form that Hutter would have chosen had he been living in the nineteenth century, and involved him in a long controversy with Röhrl, the exponent of 'vulgar-rationalism'; *Das Leben Jesu* (1829; extended as *Geschichte Jesu*, 1875); *Kirchengeschichte* (1834); *Die beiden Erzbischofe* (1839); *Neue Propheten* (1851); a life of St Francis (1856); a handbook of Protestant polemical theology (1863); a life of St Catharine of Siena (1864); *Geschichte Jesu* (1876); *Des Kulturkampfes Ende* (1879); and lectures on church history (1880). He subsequently began the publication of a church history based on his university lectures (1885 *et seq.*). His autobiography down to 1830 is entitled *Ideale und Irrthümer* (1872; 6th ed. 1908). Hase was called the Nestor of modern scientific theology. He did great service in the reconciliation of the church's faith to modern thought, and was an equally resolute and effective opponent of orthodoxy on the one hand and rationalism on the other. He died 3d January 1890.

Haselrig (otherwise HESILRIGE or HAZLERIGG), SIR ARTHUR, one of the Five Members (q.v.), commanded a noted regiment of cuirassiers called the 'Lobsters' on the side of the Parliament, took an active part in the House of Commons in connection with the militia and other bills, and was governor of Newcastle. In 1660 he half acquiesced with Monk in the Restoration, but died a prisoner in the Tower, 7th January 1661.

Hasenclever, WALTER, expressionist dramatist, born at Aachen in 1890, studied at Oxford.

Hashish, from which the word *assassin* is derived, is an Arabian preparation of Indian hemp, known in India as *dhung* or *siddhi*. It consists of the leaves, stalks, and exudations of *Cannabis indica*. The medicinal value of the preparations of Indian hemp is treated in another article; see HEMP (INDIAN). It is the physiological action which will now be specially noticed. The drug is used in the East in various ways. Sometimes it is smoked alone or with tobacco. At other times beverages are prepared from it, or it is taken in the form of lozenges or electuaries. The *majoon* of Calcutta, the *mapouchari* of Cairo, and the *dawames* or *dawamesc* of the Arabs are preparations of this kind. The effects differ according to the dose and the idiosyncrasy of the individual. Some become pugnacious, while others fall into a state of reverie. After small doses there is a great tendency to causeless merriment. In most cases there is an extraordinary susceptibility to hallucinations of various kinds, their nature depending largely on the cast of mind of the person, and to some extent on his surroundings. Time, distance, and sound are no longer correctly judged of. A minute may have compressed into it the action of a month, a handbreadth may stretch out to a mile, and the ripple of a brook may swell into the roar of Niagara. Although the dreams produced in Orientals by the drug are often of a voluptuous nature, this is by no means a universal effect upon Europeans. The stage of hallucination is generally succeeded by deep slumber and diminished sensibility. The use of hashish has the inevitable demoralising effects of all such indulgences. See MOREAU, *Du Haschisch et de l'Aliénation Mentale* (1845).

Haslar Hospital, to the south of Gosport (q.v.), between Haslar Lake and the sea, is an enormous establishment for the officers and men of the navy, dating from 1746, which can accommodate 4000 patients. Beyond are the Haslar barracks.

Haslemere, a town of Surrey, 8 miles SW. from Godalming. Its fine air and scenery have made it a favourite residence. Pop. of Haslemere (1921) 3865. Hindhead is 2 miles NW.

Haslingden, a municipal borough (since 1891) of Lancashire, in Rossendale parliamentary borough (1918). Cotton, silk, and woollen manufactures are carried on. There are ironworks, coal-mines, and stone and slate quarries. Pop. (1851) 6164; (1921) 17,485.

Hasmoneans. See MACCABEES.

Hassan-ben-Sabah, the 'Old Man of the Mountain' of European story, was founder of the Moslem sect of the Assassins (q.v.).

Hasse, JOHANN ADOLF, composer, was born at Bergedorf, near Hamburg, 25th March 1699, and studied in Italy under Porpora and Scarlatti. He became famous as *Il Sassone* ('the Saxon') through his opera *Sesostrate*, produced at Naples (1725); was *kapellmeister* at Dresden; and was brought to London in 1733 to head an opposition to Handel as representing the Italian school. Here *Artaserse* was produced with success; but Hasse soon left London, and in 1740 was in Dresden, subsequently retiring to Vienna and to Venice, where he died 23d December 1783.

Hasselt, capital of the Belgian province of Limburg, situated 18 miles by rail NW. of Maastricht, has several distilleries, manufactures linen fabrics, lace, and tobacco, and cultivates tobacco, madder, and chicory. Pop. 17,000.

Hastinapur, a ruined city of India, on the old bed of the Ganges, 22 miles E. of Meerut. It was the capital of the Great Pandava kingdom, frequently mentioned in the *Mahābhārata*.

Hastings, a parliamentary, municipal, and county (1888) borough and famous watering-place of Sussex, is picturesquely situated on the shore, surrounded by high cliffs except on the south, which is open to the sea. By rail it is 33 miles E. of Brighton and 62 miles SSE. of London. It consisted formerly of only two streets, intersected by a small stream called the Bourne, but is now a large place, whose resident population is doubled during the holiday season. Since the middle of the 19th century the borough has been greatly extended, and some portion of the hills which shelter the town contain several fine streets and terraces. The esplanade forms one of the finest sea-walks and drives in the kingdom. The climate is dry and agreeable, and the bathing very good. During cold weather in winter and spring the place is a commended resort for pulmonary complaints, being sheltered by the hills inland from easterly and northerly winds. It is famous for the mildness, salubrity, and evenness of its climate, the mean daily range of shade temperature being remarkably small as compared with nearly all other stations on the south coast. It has been said to offer a choice of three climates—the mild of the sea front, the more bracing of the inland, and the extremely bracing and invigorating of the surrounding hills, 500 feet above the sea. The sandy soil secures a dryness of soil and atmosphere not usually to be had at seaside resorts. The corporation purchased for a considerable sum the East and West Hills, fine open plateaus commanding beautiful land and sea views, and admirably adapted for golf and other outdoor sports.

The East Hill Cliffs present great interest to geologists, and are part of the town's property. They descend sheer into the sea, and are remarkable for their rugged beauty as seen from the ocean. The public gardens are well laid out, and are extensive in area. The amusements of the place are many and varied. Hotels are plentiful, and several large and flourishing schools have been established. A great attraction is the pier, having a spacious pavilion at the sea end, with ample accommodation. St Leonards-on-Sea, now incor-

porated as a western suburb of Hastings, has a similar pier, opened in 1901, about a mile westwards. The 'premier Cinque port' is one of the three or four most important fishing-stations on the south coast, coming next after Plymouth and Brixham. The ruined castle was built by a follower of the Conqueror. Hastings (since 1885) returns only one member to parliament. Pop. of municipal and county borough (1881) 42,258; and as extended in 1897 (1911) 61,145; (1921) 66,496. See Montague Burrows, *Cinque Ports* (1888).

THE BATTLE OF HASTINGS is the usual name given to the battle fought on a hill near Hastings, in which the English under King Harold were completely defeated by the Norman invaders under William the Conqueror, 14th October 1066. From that fatal day until now the place has borne the name of Battle (q.v.). Harold's force was drawn chiefly from the southern counties, and was firmly posted on the hill to which the name of Senlac was afterwards given. The Normans were arranged in three divisions, the centre led by the redoubtable duke in person. The Norman foot began the battle, and it is said that the minstrel Taillefer, riding in front singing the Song of Roland, was the first to strike a blow and the first to fall. The Norman foot spent their fury in vain upon the English position, while the Bretons on the Norman left wing were quickly put to flight. A cry now arose that the duke was slain, and panic quickly spread throughout the army. 'I live,' shouted William, as he tore off his helmet, 'and by God's help will conquer yet,' and led on his men anew to the attack. Not, however, till by a counterfeited flight he had drawn the English in eager pursuit from their strong position was he able to break their line and obtain a footing on the high ground on which they had stood so stubbornly. With the quick eye of the true soldier, William now commanded his archers to shoot high into the air that their arrows might fall from above. The English fell quickly, their shields being unable to protect their heads, and the king was soon struck down by an arrow in the right eye. The battle was now lost, but the housecarls fought where they stood till the last man was slain. See the third volume of Freeman's *Norman Conquest*, and Round's *Feudal England*.

Hastings, the county seat of Adams county, Nebraska, 95 miles W. by S. of Lincoln. It is the distributing centre for a considerable farming trade, and has several foundries and brickyards. It is the seat of Hastings College. Pop. 12,000.

Hastings, FRANCIS RAWDON-HASTINGS, MARQUIS OF, Governor-general of India, was descended from an old Anglo-Norman family settled in County Down, Ireland, and was born on 9th December 1754. Entering the army in 1771, he was engaged in many of the chief operations of the war of American independence, fighting at Bunker Hill, in Long Island and New Jersey, at the siege of Charleston, and at the battles of Camden and Hobkirk's Hill, and attained the rank of adjutant-general under Lord Cornwallis. On his return home he was created (1783) Baron Rawdon, and afterwards became intimate with the Prince of Wales. A year after he had succeeded his father as Earl of Moira he carried (1794) an army corps of 10,000 men across to Holland, to reinforce the Duke of York; and in the following year participated in the attack on Quiberon. Under the Fox-Grenville ministry he was in 1806 appointed master-general of ordnance; and he took an active part in politics until his appointment to the governor-generalship of Bengal in 1813. This high office he held down to 1821. The most momentous events of his administration were the war against the brave mountaineers of Nepal, the Gurkhas, who by the peace of 1816

were converted from aggressive enemies into the staunchest of allies; and in the next year the wars against the Pindáris and the Mahrattas, both of which were speedily brought to a successful termination, with the result that a large addition was made to the territories of the East India Company. For his masterly treatment of the Gurkha question Lord Moira was created Marquis of Hastings (1816). His policy in India included the encouragement of native education and of the freedom of the press, a reform in the law system, and the elevation of the status of the civil service. His resignation was caused by imputations levelled against his public conduct in connection with the affairs of a banking firm. In 1824, the year after his return home, Lord Hastings was appointed governor of Malta, and he held this office until his death, at Baia, near Naples, on 28th November 1826. See his *Private Journal*, edited by his daughter (2d ed. 1858); Prinsep's *Administration of the Marquis of Hastings* (1825); *Asiatic Journal* (1823); and Ross's monograph in the 'Rulers of India' series (1893).

Hastings, WARREN, was born at Churchill, in Oxfordshire, 6th December 1732. He was descended from the family of Hastings of Daylesford, but the estate had passed out of the family, and Hastings, who was early left an orphan, was educated at the expense of an uncle. He distinguished himself at Westminster School, where he was contemporary with the poets Churchill and Cowper, with the future Lord Shelburne, and with Elijah Impey (q.v.). In 1750 he went out in the Civil Service of the East India Company, and was at first employed in the secretariat in Calcutta. He was up the country at the time of the Black Hole affair, but made his escape and joined the refugees at Fulta Ghat, where he married his first wife; she died after bearing two children, who lived but a few years. Left a widower, Hastings returned to England in 1764, where he spent five years and made the acquaintance of Dr Johnson. In 1769 he returned to India as second-in-council at Madras, and in 1772 proceeded to Bengal, where he was promoted to the presidency of the council. A year later the British parliament produced the Regulating Act, under which Hastings was to be governor-general with a handsome salary, and was to be assisted by a council of four members, three appointed from home. This was the beginning of trouble; the majority in council led by Francis was opposed to Hastings from the first; the finances were in great disorder, the demands of the Company for remittances were frequent and urgent. One of Hastings' first tasks was to bring to trial the chief fiscal ministers of Bengal, Rája Shatáb Rai and Nawáb Muhamad Raza, on charges of malversation and embezzlement. This, though done under positive orders from home, proved injurious to Hastings' popularity. A corrupt and treacherous official, Nuncomar (Rája Nand Kumar), was employed in conducting the case; and when it broke down all three became his enemies. In 1775 Nuncomar was tried, sentenced, and executed for forgery, a proceeding which threw obloquy on Hastings and on the chief-justice, Sir Elijah Impey, which has been much dispelled in recent times. Among measures of domestic reform, Hastings made an appraisal of the landed estates which formed the assets of a great portion of the public revenue, and on that appraisal based a revised assessment. He also improved the administration of justice in the country courts and organised the opium revenue. In his external policy he was no less energetic and original. He waged vigorous war with the Mahrattas, and made the Company's power paramount in many parts of India. He contracted advantageous alliances and restored the financial position of the Company. All this was

not done without encountering opposition and censure. In 1777 an attempt was made to depose him, on the strength of a conditional resignation which he had sent home; and the attempt was only frustrated by the action of the Supreme Court, of which Impey was still chief-justice. In the same year Hastings married the divorced wife of Baron Imhoff, a German officer. In 1780 he was finally freed from embarrassment by the opposition owing to the retirement of its leader, Philip Francis, whom he wounded in a duel.

At the end of 1784 he resigned office and sailed for England, where he was well received by King George III., but soon became subject to a parliamentary inquiry, with a view to impeachment. Into the details of the charges brought against him we cannot here enter. Among the chief misdeeds alleged against him were the aid that he gave to his ally the Nawáb of Oudh in the war against the Rohilla Afghans, his punishment of the Zemindar of Benares for non-compliance with a demand for aid in the first Mahratta war, and his connivance in the forfeiture of property—real and personal—which had been conferred on the Begums or dowager-princesses of Oudh. Charges on these subjects were preferred by the Whig opposition, and Hastings, being deserted by Mr Pitt, was impeached at the bar of the House of Lords. The trial began 13th February 1788 in Westminster Hall, among the managers for the Commons being Edmund Burke, Fox, Sheridan, Elliott (afterwards Lord Minto), and Mr (afterwards Earl) Grey. The early sittings were numerous attended, and the audience was rewarded by splendid displays of rhetoric; but the public interest soon flagged. It was felt by those persons who knew or cared about the matter at all that the alleged errors of Hastings were overbalanced by great public services. He had prevailed in war; he had left Bengal at peace; he had organised the administration in all its branches; he had fostered learning; above all, he had founded an empire which no one thought of abandoning. The trial dragged itself through more than seven years and nearly 150 sittings. At last, on the 23d April 1795, Hastings was acquitted on all the charges, unanimously on all that affected his personal honour. Out of the original members who had met in Westminster Hall when Hastings first bowed his knee at the bar but twenty-nine were left to vote for the final award; the remaining peers stood round the throne as spectators. Hastings left the court a ruined man, the small fortune that he brought from India having been quite consumed in the expenses of the defence. But the Court of Directors came to his aid and made provision for his declining years. Carrying out what is said to have been an aspiration of his youth, Hastings bought the old family seat of Daylesford, in Worcestershire, where he passed the rest of his life in the occupations of a country gentleman, varied by occasional visits to London. He gave evidence before parliamentary committees, and dined at Carlton House; the prince-regent made him a privy-councillor; and he received honours from the city and the Houses of Parliament. He died at Daylesford, 22d August 1818. In his long and active career Hastings showed constant energy, courage, judgment, and application. In his private life he was gentle and unselfish.

See Gleig's *Memoirs* (3 vols. 1841); Mill's *History of India*, corrected by Wilson's notes; Stephen's *Story of Nuncomar*; Lives of him by Trotter (1878), Lyall (1889), Malleon (1894); books on some aspects of his public life by Strachey (1892), Forrest (1890-1910), and M. Monkton-Jones (1913); his private life by Sir C. Lawson (1896), and his own letters to his wife (published in 1906); and the article by Keene in the *Dictionary of National Biography*. Macaulay's famous and eloquent essay is unfortunately quite untrustworthy.

Hastings Sands, the lower division of the Wealden beds, part of the Lower Cretaceous series. The beds consist chiefly of sand and sandstone with subordinate layers of clay, and vary in thickness from 500 to 1000 feet; and the group embraces, in descending order: (3) Tunbridge Wells Sand, (2) Wadhurst Clay, (1) Ashdown Sand. The strata differ very little from those of the overlying Weald Clay, except in being more arenaceous. The beds have been deposited in shallow fresh water. The sand often exhibits fine specimens of ripple-marks, and the clay which separates the sand-beds sometimes contains cracks that have been produced by the drying of the surface on exposure. The strata are highly fossiliferous. There are numerous saurian reptiles, including the huge *iguanodon* and the winged *pterodactyl*. The remains of several chelonians also occur. The fish belong chiefly to the ganoid or placoid orders, the most remarkable being the *Lepidotus*, whose conical palate teeth and thick square enamelled scales are very frequent. The shells belong to genera which inhabit fresh water, such as *Paludina*, *Cyrena*, and *Unio*.

Hat, the principal head-covering of the human family, distinguished from the cap or bonnet by having a brim around it. The history of the hat is of necessity intimately mixed up with that of head-coverings generally, the distinctions of bonnets, hats, and caps being arbitrary and subject to many variations with changing fashion (see illustrations in article FASHION). The hat, as a roomy brimmed head-covering, is the direct descendant of the *petasus* of the ancient Greeks, which was distinguished from the other Greek head-gear, the *pileus*, by the possession of a brim, useful for protecting its wearer from the rays of the sun. These Greek hats were made of felt, the material of which the head-gear of early times appears to have been principally fabricated. The use of felted hats became known in England about the period of the Norman conquest. The merchant in Chaucer's Prologue to the *Canterbury Tales* is described as having 'on his hed a flaundrish bever hat.' About the period of Queen Elizabeth beaver felts in many shapes became common, and for three centuries thereafter fine beaver hats, mostly dyed black, formed the head-covering of the higher classes in Great Britain. But now, though felt hats are the everyday wear of the community, there is no longer such a thing as a genuine beaver hat. See BEAVER, FELT.

Hats at the present day are fashioned of an endless variety of materials, and, especially in the case of those worn by ladies, they are so diversified in form that they defy all definition. But with all their variations three principal classes of hat-manufacture may be distinguished, comprised under the felt-hat, the silk-hat, and the straw-hat trades. In the felt-hat trade, the materials now principally employed are the fur or hair of rabbits, with smaller proportions of hare, beaver, musk-rat, vicuna, and camel for the finer felts; and sheep's wool for the commoner felted hats. Felt hats of inferior quality are also made with wool mixed with cotton and other vegetable fibres—not in reality felted, but cemented by varnish which is used at once to hold together the fibres and to stiffen the hat body. In the felting of rabbit, hare, and other furs, a 'bat' is first formed, which consists of an expanded cone of equally distributed fibres in quantity sufficient to form the desired hat. To make this 'bat,' a perforated cone of sheet copper is caused to revolve slowly over a funnel under which there is a powerful blast drawing air inwards through the holes in the copper cone. Fur is fed towards and drawn over the surface of the cone in an equal manner by the suction, and is so held in position till a sufficient quantity to form the hat is uniformly distrib-

uted over it. A wet cloth is then wrapped around the mass, over which an outer cone is slipped, and the whole then dipped into an acidulated bath of hot water, and by pressure the first stage of felting—making the bat cohere—is secured. The subsequent operations are the same in making both fur and woollen felts. In the felting of wool for hats the bat is formed from carded wool wound diagonally round a double cone, which gives two bats. These are subjected to the usual operations of felting till a sufficient consistency of felt is obtained. The hats are thereafter roughly blocked on a mould to something of their ultimate form, then dyed, and when hard felts are to be made they are stiffened with a varnish of shellac. They are then shaped on a block, smoothed with sand-paper, bound, lined, and finished. The principal supply of rabbit fur for felting is obtained in France and Belgium from domestic rabbits, hundreds of millions being in these countries annually killed as articles of food and for the fur they yield.

The manufacture of silk hats as a substitute for piled beavers was first attempted about 1810, but it was not till 1830 that silk plush hats were successfully made in France. The silk hat consists of a body and rim, usually made of two or three layers of cotton cloth saturated with varnishes, to give the fabric stiffness and make it waterproof. These are moulded on wooden blocks according to the fashion of the day; and when the desired shape is produced the whole is carefully varnished over with lac and dammar varnish, and before dry the fine silk plush is applied with great nicety, so as to prevent the seams being perceived. It is then trimmed with silk braid on the edge of the brim, and a silken band round the junction of the body with the brim; and the lining of leather and thin silk being put in, it is complete. Opera-hats or crush-hats consist of a covering of merino stretched over a spiral steel frame, which by pressure flattens down, so that they can be easily carried.

The manufacture of straw hats, which forms an entirely distinct branch of the hat trade, will be dealt with under Straw (q.v.). In the United Kingdom the felt-hat trade is principally centred at Denton and other villages in the neighbourhood of Manchester. See Dr O. Timidor, *Der Hut und seine Geschichte* (trans. in *The Hatters' Gazette*, Sept. 1914 onwards).

Hatch, EDWIN, a learned theologian, born at Derby, 4th September 1835. He was educated at King Edward's School, Birmingham, and at Pembroke College, Oxford, and took a second-class in classics in 1857. After some years of teaching as professor of Classics at Trinity College, Toronto, and rector of Quebec High School, he returned to Oxford as vice-principal of St Mary Hall in 1867, a post which he held till his resignation in 1885. He was appointed rector of Purleigh, Essex, in 1883, and next year reader in Ecclesiastical History at Oxford. The Grinfield lectureship on the Septuagint he held from 1880 to 1884. His articles on such heads as 'Ordination,' 'Priest,' &c., in Smith and Cheetham's *Dictionary of Christian Antiquities*, had already attracted wide attention, when his profoundly learned and admirably argued Bampton Lectures, in 1880, on *The Organisation of the Early Christian Churches*, firmly established his reputation both in England and Germany as one of the ablest and best-equipped theologians of the time. The book struck a blow at the roots of High Church claims, and proved to be more easily denounced than answered. It had the honour to be translated by Harnack. In 1888 he delivered a course of Hibbert Lectures on *Greek Influence on Christianity*. Hatch was made D.D. by Edinburgh in 1883; published in 1887 *The Growth of Church Institutions*, a profoundly learned book, though

written in a bright and popular style; *Essays in Biblical Greek* in 1889; and had made considerable progress with his projected *Concordance to the Septuagint* when his career was cut short by untimely death, at Oxford, 10th November 1889. A collection of noble religious poetry, *Towards Fields of Light* (1889), and a volume of striking sermons, *The God of Hope* (1890), appeared posthumously, the latter with a brief biographical sketch by his brother. See Dr Sanday in the *Expositor* for February 1890.

Hatching. See INCUBATION, POULTRY.

Hatchment. ACHIEVEMENT, or FUNERAL ESCUTCHEON, the arms of a deceased person within a black lozenge-shaped frame meant to be placed on the front of his house. If the deceased was unmarried or a widower or widow the whole field of the escutcheon is black.

Hatchment of Husband.

In the hatchment of a married person only that part is black which adjoins the side of it occupied by the arms of the deceased. Thus, in the hatchment of a husband the dexter side is black, the sinister white; in that of a wife the reverse. The old funeral escutcheon of Scotland, similarly to that of Germany, had the *seize quartiers* of the deceased arranged round his personal arms, and in strictness no one, unless his ancestors on every side up to four generations had armorial rights, was entitled to a funeral escutcheon. Escutcheons of this kind are now seldom seen even in Scotland. The black frame is sometimes powdered with drops to represent tears, and the skull and cross-bones at the corners are hardly out of use.

Hatfield, or BISHOPS HATFIELD, a market-town of Hertfordshire, 18 miles NNW. of London by rail. There exist a few scanty remains of the 12th-century palace, once the property of the bishops of Ely, but, together with the manor, seized by Henry VIII., and successively the residence of that king, of Edward VI. and Queen Elizabeth before their accession, and of James I. Hatfield House, the seat of the Marquis of Salisbury, was built by Sir Robert Cecil in 1611, and is a fine specimen of Jacobean architecture, rich in portraits and historical manuscripts. Population of rural district, 9000. See its history in Brewer's *English Studies* (1881).

Hatfield Chase, a fenny tract of land in the West Riding of Yorkshire, lying between the Trent and Doncaster, some 180,000 acres in extent, which has been drained, and is now cultivated. See *The Level of Hatfield Chase*, by John Tomlinson (1882).

Hatherley, SIR WILLIAM PAGE WOOD, BARON, Lord Chancellor of Great Britain, was born in London in 1801, and educated at Winchester, and Trinity College, Cambridge, and subsequently called to the bar. He was returned in 1847 as Liberal member for Oxford, in 1851 was appointed solicitor-general and knighted, in 1853 became vice-chancellor, in 1868 a lord justice in the Appeal Court and lord chancellor, being at the same time raised to the peerage as Baron Hatherley. His name is associated with a Bankruptcy Act of 1869. He resigned office in 1872 in consequence of failing eyesight, and died on 10th July 1881. From his pen came *Truth and its Counterfeits*

(1857) and *The Continuity of Scripture* (1867-69). See *Memoir* by W. R. W. Stephens (1883).

Hathor, the name of an Egyptian goddess, ranked among the second class of deities, who was the daughter of Ra, the sun. See EGYPT.

Hathras, a well-built town of India, in the United Provinces, 21 miles S. of Aligarh. It is the commercial centre for the Upper Doab, and has a large export trade in sugar, grain, cotton, oil-seeds, and *ghi*, and imports iron and metal-ware, cloth, &c. The delicate carved work of the town is famous. Pop. 39,000.

Hâtim et-Ta'î was chief of the Arabian tribe of Tai, and flourished shortly before the advent of Mohammed. He was renowned for his extraordinary liberality, and his name is at the present day synonymous throughout the Moslem world with all that is open-handed and generous. No greater compliment, indeed, can be paid to an Asiatic prince or noble than to style him 'a second Hâtim.' Many anecdotes of his liberality and magnanimity are recounted by poets; thus Sa'dî says: 'Hâtim Ta'î no longer exists, but his exalted name will remain famous for virtue to eternity. Distribute a tithe of your wealth in alms, for when the husbandman lops off the exuberant branches from the vine it produces an increase of grapes.' See Clouston's *Group of Eastern Romances* (1889).

Hatteras, CAPE, a low point of North Carolina, forming part of a sandbank, in 35° 15' N. lat. and 75° 31' W. long. The coast-line here turns from the NE. to N.; violent storms are frequent, and render navigation dangerous.

Hatteria. See SPHENODON.

Hattî Sherif, Humâyûn. See FIRMÂN, TURKEY, STRATFORD DE REDCLIFFE.

Hatto, the name of two archbishops of Mainz, who have a somewhat conspicuous place in the history of Germany. The first of these was chosen Archbishop of Mainz in 891, and died in 913.—The second archbishop of that name was a monk of the monastery of Fulda, and succeeded the celebrated Rabanus Maurus, well known in the history of the eucharistic controversies, as abbot of the monastery of St Boniface, about the year 942. In the second expedition of the Emperor Otho I. into Italy in 961 Hatto was sent as his ambassador from Pavia to Rome; and after his return, on the death of Archbishop William, he was raised to the see of Mainz, and continued one of the chief directors of the imperial counsels. Of his later life and of his personal character the most opposite accounts have been given. By some he is represented as a zealous reformer, and an upright and successful administrator; by others as a selfish and hard-hearted oppressor of the poor; and the strange legend of his being devoured by rats, which Southey has perpetuated in his well-known ballad, is represented as an evidence of the estimate that was popularly formed regarding him. It is by no means improbable, however, that this legend is of a much later date, and that its real origin is to be traced to the equivocal designation of the tower on the Rhine, Mäuseturm, near Bingen, which has been selected as the scene of the occurrence. *Mäuseturm*, 'Mouse-tower,' is possibly only a corrupted form of *Mauts-turm*, 'Toll-tower,' a sufficiently descriptive name; but the modified form of the word might readily suggest a legend of mice or rats. Another etymology is from *muserie*, an old word for ordnance. The date at which the Mäuseturm was built is unknown, and it is far from certain that it is not much later than the time of Hatto. It was stormed by the Swedes in 1635. Archbishop Hatto died in 969 or 970. A like tale is told of many others elsewhere. See Baring-Gould, *Curious*

Myths of the Middle Ages (1869), and Max Beheim, *Die Mäusethurm-sage* (1888).

Hatton, JOHN LIPTRÖT, a self-educated composer, was born at Liverpool in 1809, and, settling in London in 1832, soon made his name known. From 1853 to 1859 he was musical director of the Princess's Theatre. He composed numerous operas, cantatas, overtures, entr'actes, &c., but is remembered chiefly for his musical settings of English songs, such as 'Simon the Cellarer,' 'Under the Greenwood Tree,' 'Weep no more,' 'Leather Bottel,' 'To Anthea,' &c. He died on 20th September 1886.

Hatzfeld (Serb. *Žombolja*), a town of Yugoslavia, 20 miles by rail W. of Temesvar; pop. 10,000.

Hauber. See ARMOUR.

Hauch, HANS CARSTEN, Danish poet, was born at Frederikshald, in Norway, 12th May 1790. His first attempts in literature being unsuccessful, he began to study natural history; but in 1846 was appointed to the chair of Northern Literature in the university of Kiel. Two years later the Holstein revolution drove him back to Copenhagen; and on the death of his friend Oehlenschläger, in 1850, he succeeded him in the chair of Aesthetics at the university there, and held it down to his death, at Rome, 4th March 1872. Hauch's riper and more successful works embrace nine historical tragedies, all written between 1828 and 1850, in which he exhibits great powers of individualising character and portraying the local colouring of his scenes; *Lyriske Digte* (1842, 1862, and 1869), some of which are extremely beautiful, and enjoy an undisputed popularity in Denmark; and many tales and romances, &c. His epic-dramatic poem *Hamadryaden* (1830) met with warm appreciation in Germany. At Copenhagen there appeared in 1873-75 Hauch's *Samlede Romaner og Fortællinger*.

Hauff, WILHELM, German writer, was born at Stuttgart, 29th November 1802, and was educated at Tübingen. He acted for a couple of years as private tutor, and had been editor of the *Morgenblatt* for about three-quarters of a year when he died from a chill, 18th November 1827. Although only twenty-five at the time of his death, Hauff has taken a permanent place in German literature. This reputation is due to his *Märchen* or fairy-tales (1826-28) and his *Novellen* (1828), all alike admirable for their freshness, simplicity, and playful fancy. Two of the latter, *Die Bettlerin vom Pont des Arts* and *Das Bild des Kaisers*, may be regarded as masterpieces. His greatest effort was, however, the exhilarating *Phantasien im Bremer Rathskeller* (1827). Some of his poems, of which he only wrote a few, have become *volkslieder*. All these works were but short; his longest productions were none of them so successful. The romance of *Lichtenstein* (1826), although popular in Germany, owing to its local fidelity and its being almost the first historical novel written in German in Sir Walter Scott's style, reveals several defects when tested as a work of art. His earliest lengthy work, *Memoiren des Satans* (1826-27), is an incomplete and immature production, but full of promise as an example of satiric humour. In the same vein Hauff wrote a parody of Clauden in *Der Mann im Monde* (1826), and an earnest satire against him in *Kontroverspredigt* (1826). His *Sämmtliche Werke* were published by G. Schwab in 5 vols. in 1830.

Haug, MARTIN, Samskritist, born 30th January 1826, near Balingen, in Württemberg, was professor at Poona from 1859 to 1866, and at Munich from 1868 till his death, 3d June 1876. He wrote on the Pehlevi language, and on the Rig-veda, and *Essays on the Sacred Language, Writings, and Religion of the Parsees* (1862).

Haulbowline. See CORK.

Haunted Houses in former times were very common in every corner of England and Scotland, and many persistent traditions descended of unquiet spirits who were doomed to haunt for ever the spot on which they had wrought or suffered some deed of blood. Dim shadows of earthly forms, they continued into their ghostly existence the form and aspect that they wore in life, and the gaping and bleeding wounds of murder froze the heart of the beholder from age to age. Shrieks, wailings, wringing of the hands, knockings, infernal curses and blasphemies—such were some of the accessory horrors that the popular imagination cast around these ghostly creations, of whom many continued to possess, but in intensified form, all the power and disposition to evil which had belonged to them in life. These unquiet spirits could sometimes be *laid*, or compelled to rest finally in their graves, or the Red Sea, by the exertions of clergymen of pre-eminent piety, who often contrived to exorcise them by passing a night of severe religious exercises alone in the haunted chamber or house. The inevitable decline of belief in the supernatural has swept away almost all our domestic ghosts, spite of the especial proneness of the popular imagination to this kind of belief. Of the haunted houses of Scotland, past or present, none are more famous than Glamis Castle, Cortachy Castle, and Spedlins Tower; no local ghosts were more persistent than those that haunted Newton Castle, Huntingtower, Allanbank, Woodhouselee, and Finhaven. In England, among the most striking cases are Corby Castle with its 'radiant boy,' Peel Castle with its 'Mauthe Dog,' Ashley Hall, Skipton Castle, Hilton Castle with its 'Cauld Lad,' Holland House, Rainham Hall with its 'Gray Lady,' Tharston Hall, Newstead Abbey, Powis Castle, and Caistor Castle, round the courtyard of which drives every year a ghostly carriage drawn by four headless horses. No less rich in stories of haunted houses are Ireland, Wales, Brittany, and Germany, and no stories of this class are more weird and gruesome than the examples in the folklore of Russia. Spectral animals as well as men and strange lights were seen at some places, and there are authentic stories of undignified apparitions of whose presence mortals were made aware by their sense of smell. The 'Shuck Dog' of Norfolk is of large size and black colour, with great yellow eyes, and brings sure death to any one he meets. Sometimes, however, he is headless, or with but one blazing eye in the centre of his forehead. Indeed, the whole subject of spectral apparitions opens up a large chapter in popular demonology, which has been somewhat grotesquely overlaid with the theological conception of the devil.

Countless stories, old and new, are told of spirits that have at various times infested houses to the terror of their earthly inmates. Of these classical examples are those connected with Tedworth, testified to by Joseph Glanville, and with Epworth Rectory, on the still less impeachable evidence of John Wesley. An interesting modern example of how stories of this kind can be manufactured even in our day, out of hearsay and third-hand statements, is that of the haunted house in Berkeley Square, which seems to have received its popularity and fame from being identified through some accidental circumstances as the scene of a similar story related in *Temple Bar* for 1868 by Rhoda Broughton of a house in the country. Those who are sufficiently interested can follow the growth, if not the actual genesis, of the story in a series of communications to *Notes and Queries*, sixth series, vols. ii. and iii.

See the article APPARITIONS and the books enumerated there; and particularly John H. Ingram's *Haunted Homes of Great Britain* (1884); Camille Flammarion, *Haunted Houses* (1924); and the *Proceedings of the Society for Psychical Research*.

Haupt, MORITZ, a Germanist and classical scholar, was born at Zittau, 27th July 1808, was professor at Leipzig from 1843 to 1850, and from 1853 in Berlin. He was secretary to the academy there, and died 5th February 1874. He edited several Latin classics (Ovid, Horace, &c.), and many Middle High German poems.

Hauptmann, GERHARD (JOHANN ROBERT), German dramatist and novelist, was born 15th November 1862 at Salzbrunn in Lower Silesia, son of a hotel-keeper and grandson of a weaver. He was educated at the Realschule of Breslau, and after a short spell on an uncle's farm at the art school of the same town, whence he moved to Jena University for a time, then visited Spain, and continued his study of sculpture at Rome and Dresden. In 1885 he settled in Berlin, married, and published an epic, thereafter devoting himself to literature. At first he followed the naturalistic school, influenced by his friend Arno Holz, by Zola, Tolstoi, and Ibsen. His first significant work, *Vor Sonnenaufgang*, was put on the stage in 1889, and contention was strong for and against its author. To this period belong also the plays *Das Friedensfest* (1890) and *Einsame Menschen* (1891), as well as *Bahnwärter Thiel* and *Der Apostel* in fiction. It was *Die Weber* (1892), a play exhibiting man in mass, a realistic presentation of the miseries of the Silesian weavers in the rising of 1844, that established Hauptmann as a really great dramatist. *Kollege Crampton* and *Der Biberpelz* are both comedies of milieu, excelling in character-drawing and humour. In *Hanneles Himmelfahrt*, Hauptmann brings naturalism and romantic dreams together. His historical tragedy of *Florian Geyer* (1895) is again naturalistic. But at last in *Die Versunkene Glocke* (1896) he takes his place as one of the world's poets. This delectable 'märchen-drama' has been read as an allegory of the struggle in the author's mind between the poet and the social propagandist, the minute delineator and the imaginative artist. The works of the period that follows illustrate this struggle—*Fuhrmann Henschel*, *Schluck und Jau*, *Michael Kramer*, *Der rote Hahn*, *Der arme Heinrich*, *Rose Bernd*, *Elga*, *Und Pippa tanzt*. A visit to Greece in 1907, described in his *Griechischer Frühling*, was another turning-point in his life, a Greek spring indeed, an irruption of the classical spirit. Some would reckon his new period from 1910, when he published his famous novel *Der Narr in Christo: Emanuel Quint*. He has drifted away altogether from realism, and devoted himself to the lyrical and mystical in fiction, in drama, in lyric, and in narrative verse. *Atlantis* (1912) was less successful; but *Der Ketzer von Soana* (1919) is regarded as his masterpiece in fiction and description. Of the poetical plays of this time, *Winterballade* (1917) is founded on Selma Lagerlöf's story, *Pastor Arne's Hoard*; *Indipohadi* and *Der Weisses Heiland* (1920) are laid in old Mexico, the first dealing with the *Tempest* theme, the second with the disappointment of Messianic hopes in Cortes. Later poems and fragments are *Anna* (1921), a love idyll in hexameters; some vigorous and beautiful short poems; *Helios* and *Das Hirtenlied*, autobiographically important; a play of *Veland*; and some instalments of a *Til Eulenspiegel* epos.

See his *Leben und Werke*, ed. A. Eloesser (12 vols. 1922); *Dramatic Works* (Eng. trans., ed. L. Lewisohn, 7 vols. 1913-19); *Life* by Paul Schlenker.

Hauptmann, MORITZ (1792-1868), a Leipzig composer and writer on music, had Joachim,

Von Bülow, Sullivan, and Cowen amongst his pupils.

Haupur. See HAPUR.

Hauraki, a gulf and a gold-bearing peninsula of New Zealand, opposite Auckland (q.v.).

Haurân (anc. *Auranitis*), a large district east of the Sea of Galilee. The name is sometimes restricted to one fertile plain there. See BASHAN, DRUSES.

Hauréau, JEAN BARTHÉLEMY (1812-96), historian, was born in Paris, and held posts in the National Library and the National Printing Office. He wrote on Poland, Francis I., Charlemagne, St Victor, &c., but is best known by his great *Histoire de la Philosophie Scolastique* (1872-81).

Hausa. See HAUSSA.

Hauser, KASPAR, 'the wild boy,' found in the market-place of Nuremberg in May 1828, unable to speak coherently, and holding in his hand a letter professedly written by an illiterate workman, who said that the boy had been deposited at his door an infant by some one unknown, and that he had brought him up in strict seclusion. Enclosed in the letter was another, evidently by the same hand but pretending to have been penned by the mother of the youth, stating that she, a poor girl, had given birth to a babe on 30th April 1812, that his name was Kaspar, and that his father, then dead, had been a soldier. The youth's mind was totally blank, not from idiocy, but because he had had no education whatever and was utterly ignorant. When senses and mind began to be schooled, he was able to give some account of his former existence. As long as he could remember he had been in a hole or cage, too small for him to rest in any other posture than seated on the ground with his legs stretched straight out before him. His only clothing had been a pair of trousers and a shirt. He had never seen the sun nor heard sound of the outer world. Food—bread and water—was always supplied to him whilst he slept, and sometimes he was made to sleep by 'nasty stuff' (laudanum) put in the water. He had spent his time playing with two toy horses. He was attended to by 'a man,' who at last taught him to write a little, and to stand and to walk; and finally 'the man' had put shoes on his feet and had brought him to Nuremberg by night, and, placing the letter in his hand, had disappeared. The town authorities eventually decided to adopt this strange and forlorn being thus mysteriously brought to them. But about fifteen months later, on 17th October 1829, he was found bleeding from a wound in the forehead, which, he said, had been inflicted by 'the man.' But this individual could not be found, nor even any trace of him. Meanwhile attempts were being made to educate the untutored youth, and to civilise him. At first he showed a keen thirst for knowledge, marvellous powers of memory, and wonderful quickness in apprehension; but as his body began to grow rapidly, his mind, which had apparently been early checked in its growth, soon reached the full measure of its expansion and development. Crowds of the curious had at first flocked to see the strange boy, and visitors to the city still came to visit him. Amongst these was the eccentric Lord Stanhope, who conceived a sudden fancy for Kaspar and adopted him, sending him to Ansbach to be educated. But, as his mental development had suffered an arrest, so now his moral character began to deteriorate; and he was being gradually forgotten, when on 14th December 1833 he suddenly burst into the house, bleeding from a wound in his side, which he said had been dealt him by 'the man,' who on this occasion too could not be discovered. Three days later Kaspar Hauser died. Beyond these facts

nothing more is known about him. Owing to the many inconsistencies in his story and the mystery surrounding him, many have regarded him as an artful impostor, and believe that he died an involuntary suicide. Others, again, looked upon him as the victim of a hideous crime, and believed that he was of noble birth, some indeed (since 1834) making him out to have been heir to the throne of Baden. But in 1875 the government of Baden disproved the imputation by documentary evidence. See Eliz. E. Evans's monograph (1892), and Andrew Lang's *Historical Mysteries* (1904).

Hausa, or **HOUSSA**, a people of the Sudan, who were conquered by the Fulahs (q.v.), and now constitute the larger part of the population in a great area of Northern Nigeria; from the Niger to Bornu they are negroid, with some Fulah and Arab blood, but are hardly distinguishable from the Negroes. Their language is allied in its grammatical forms with the Hamitic tongues to the east and north, whilst its vocabulary resembles in many points that of the neighbouring Negro tribes. The Hausa language is the common medium of communication from the Sudan to the Gulf of Guinea. The Hausa themselves are keen traders, occupying themselves with agriculture, and making cloth, leather articles, and glass. They have adopted Islam from their conquerors. Many were soldiers in the 'West African Frontier Force,' and gave excellent service in the Great War. They are also smart and useful members of the constabulary in the Gold Coast. See AFRICA, FULAHs, BORNU, KANO.

Hausmann, **GEORGES EUGÈNE**, who as prefect of the Seine did so much for the improvement and embellishment of Paris between 1853 and 1870, was born in that city on 27th March 1809. Entering the public service under Louis-Philippe, he distinguished himself in various parts of France, and under Napoleon III. rose to be prefect of the Seine (1853). Then it was that he began his task of improving the outward appearance of Paris by widening streets, laying out boulevards and parks, building sewers, barracks, bridges, and similar public works. For these great services he was made baron and senator. But the heavy financial burdens (£35,000,000) which these improvements laid upon the citizens was the cause of Hausmann's dismissal from office in 1870. In the following year he was, however, appointed director of the *Crédit Mobilier*, and in 1881 was elected a member of the Chamber of Deputies. 'Hausmannizing' has become a term for the reckless destruction of ancient buildings to make way for new streets. See his *Mémoires* (3 vols. 1890-93). He died 11th January 1891.

Hautbois. See OBOE.

Hatty, **RENÉ JUST**, a French mineralogist, was born at St Just, department Oise, 28th February 1743, studied for the church, and took priest's orders. His attention was first turned to botany, and it was not until middle life that he commenced the study of mineralogy. He is the discoverer of the geometrical law of crystallisation, and he also considerably enriched our knowledge of pyro-electricity. After occupying several important posts, such as commissioner of weights and measures, curator of the cabinet of mines, and professor of mineralogy, he died on 3d June 1822. His most important works, besides an essay on crystals and a treatise on electricity, are *Traité de Minéralogie* (2 vols. 1801), *Traité Élémentaire de Physique* (2 vols. 1803), *Traité des Caractères Physiques des*

Pierres Précieuses (1817), and *Traité de Cristallographie* (2 vols. 1822).—His brother **VALENTIN HAÛY** (1746-1822) devoted his life to the education of the Blind (q.v.). He wrote *Essai sur l'Éducation des Aveugles* (1786).

Hauyne, a rock-forming mineral, having approximately the same composition as Nosean, but richer in lime. The two are probably parts of an isomorphous series of anhydrous silicates of alumina and soda, or alumina and lime, with sodium and calcium sulphate. They crystallise in isometric forms, and have a hardness = 5·5-6, and a specific gravity = 2·2-2·5. Hauyne is usually bright blue to bluish-green, while Nosean is generally gray, but sometimes greenish or even dark brown. They are essentially of volcanic origin, occurring as constituents of many recent lavas.

Havana, or **HAVANNAH** (properly 'San Cristóbal de la Habana'), the capital of the island of Cuba, and the principal centre of commerce in the West Indies, is situated on the north side of the island. Access is obtained to its magnificent well-sheltered harbour by a channel 350 yards wide, the entrance to which is defended by several forts. The streets of the older part of the town, which until 1863 was enclosed within walls, are narrow and dirty, and the harbour has been for generations polluted by the town sewage. With this older part the more modern portion lying to the west is connected by broad tree-shaded avenues and gardens. The houses, which are low, are solidly built of stone, have flat roofs, verandas, and barred windows reaching down to the ground, and are gay with paint and white marble decorations. The city wall (1671-1740) had disappeared by 1880. The most noteworthy of the public buildings are the cathedral, built in the old Spanish style in 1724, whence the bones of Columbus (q.v.) were removed to Spain after the loss of the island in the war with the United States in 1898, the palace (seat of the president and government), completed in 1920, and the hospital 'Beneficencia,' with orphan and lunatic asylums and a poorhouse. Since 1900 the city has been much Americanised in aspect. The public institutions include an arsenal, a botanical garden, a university, a technical school, and theatres. A specially severe cyclone wrought much destruction in October 1906. Population, 360,000. The staple industry of the place is cigar-making; sugar and tobacco are the staple products; boxes and barrels are made; and molasses, rum, wax, and honey are also exported. Since the evacuation of Cuba by Spain the trade of Havana has considerably increased. When the city was handed over to the new republic of Cuba by the United States in 1902, great improvements had been made in sewage and other sanitary arrangements—insomuch that yellow fever was in a year's time almost eradicated. Havana was originally founded on the south coast, near the modern Baracoa, by Diego Velasquez in 1515, but four years later was transferred to its present site. In the course of its unfortunate history it was burned to the ground by buccaneers in 1528, plundered by another band in 1555, and captured by a third in 1563, and again by the English in 1762. In the 17th century, however, it was made the chief emporium of Spanish trade in the West Indies and the point of rendezvous for the Spanish gold fleets.

Havant, an urban district of Hampshire, 8 miles N.E. of Portsmouth. Tanning and matting are the chief industries. Pop. 4400.

Havas Agency, an organisation in Paris, founded by a rich merchant, Charles Havas, in the reign of Louis-Philippe, for the purpose of gathering telegraphic news and supplying it to newspapers. It was in 1879 converted into a company.

Havel, a tributary of the Elbe, which has its origin in a small lake in Mecklenburg, flows southward past Spandau to Potsdam, and thence west to Brandenburg, and finally north-west to its junction with the Elbe, opposite the town of Werben. It passes through several lakes and canals on its way. Its entire length is 220 miles; it is navigable to within 15 miles of its source; its drainage basin measures 10,160 sq. m. Its most notable tributary is the Spree, on which Berlin stands.

Havelock, SIR HENRY, one of the heroes of the Indian mutiny, was born April 5, 1795, at Bishop-Wearmouth, in Durham, where his father was a merchant and shipbuilder. He was educated at the Charterhouse, and was at first intended for the law, but, following his elder brother's example, entered the army a month after Waterloo, and went out to India in 1823. It was during the voyage that that conversion occurred which coloured all his after-life. Havelock distinguished himself in the Afghan and Sikh wars, but was still a lieutenant after 23 years' service. In 1856 he commanded a division of the army that invaded Persia. News of the Indian mutiny hastened his return to Calcutta, and ere long he had organised a small movable column at Allahabad with which to push on to the relief of the British at Cawnpore and Lucknow. A forced march brought his 1000 men to Fatehpur, where he engaged and broke the rebels. He continued his march upon Cawnpore, driving the enemy before him. The cowardly miscreants at the suggestion of the infamous Nana Sahib revenged their defeats before abandoning Cawnpore by the atrocious massacre of all the European women and children in their hands. At Ahirwa Havelock found the rebels strongly entrenched, but turned their left, and carried the village by a splendid charge of the 78th Highlanders. He now entered Cawnpore, and saw with his own eyes the horrors of the massacre. The sight steeled the hearts of his handful of heroes, who quitted Cawnpore to advance upon Lucknow. Crossing the Ganges, he repulsed the rebels at Unao, but after fighting eight victorious battles he found his little army so thinned by fatigue and sickness that he was reluctantly compelled to retire upon Cawnpore. Early in September General Outram arrived with reinforcements, and Havelock again advanced to the relief of Lucknow; Outram, with a chivalrous generosity characteristic of that heroic time, waiving his superior rank, and serving under Havelock as a volunteer until Lucknow was saved. The relieving force, which mustered 2500 men and 17 guns, after a sharp brush with the enemy engaged them at the Alum-Bagh, an isolated building about three miles from the Residency of Lucknow. Next with desperate bravery they fought their way through streets of houses, each a separate fortress, until they gained the Residency, to the indescribable joy of the beleaguered garrison. The victorious army were now in turn besieged, but held their own until November, when Sir Colin Campbell in his turn forced his way to their rescue. After the relief of Lucknow Havelock was attacked by dysentery, died November 22, 1857, and was buried in the Alum-Bagh. Before his death news arrived of his elevation to the distinction of K.C.B. Other honours were in store for him, but they came too late. He was made major-general; appointed to the colonelcy of the 3d Foot, and a baronet, with a proposed pension of £1000 a year. The rank and the pension were given to his widow, daughter of the Baptist missionary, Dr Marshman; a new patent of baronetcy issued in favour of the eldest son, as his father's was sealed only the day after his death; and a statue was erected by public subscription in Trafalgar Square. Havelock was

strict in his religion, and severe in his discipline, somewhat after the type of the grave and fearless Puritans who fought and conquered under Cromwell. 'For more than forty years,' he said to Sir James Outram in his last moments, 'I have so ruled my life that when death came I might face it without fear.' This he did, and among her noblest soldiers England will never cease to remember the Christian hero, Sir Henry Havelock. See Lives of him by W. Brock (1858), Miss Maishman (1860), and A. Forbes (1890).

Havelok the Dane. See the article on ENGLISH LITERATURE, and the editions of the romance by Professor Skeat (1868 and 1902; rev. G. K. Sisam, 1915) and Holthausen (1901).

Haven. See HARBOUR.

Haver, a term used in Scots law to denote the person in whose custody a document is.

Haverfield, FRANCIS JOHN (1860-1919), an English archaeologist and historian, was educated at Winchester and Oxford. From 1884 till his appointment in 1891 as tutor of Christ Church, Oxford, he was a master at Lancing College. In 1907 he was made Camden Professor of Ancient History at Oxford. He was the greatest authority of his time on Roman history and on the Roman remains in Britain. He resembled in intellect and interests the great Mommsen, whose mantle had fallen on his shoulders. Haverfield published some 500 books and articles on his chosen subject, which include *The Romanization of Roman Britain* (4th ed. 1923), *Roman Britain* (1914), and *The Roman Occupation of Britain* (revised by George Macdonald, with a notice on Haverfield's Life and a bibliography, 1924).

Haverfordwest (Welsh *Hwlfordd*), a municipal borough, seaport, and market-town of Wales, capital of the county of Pembroke, and a county of itself, occupies a picturesque situation on the river Cleddau, 10 miles NNE. of Milford by rail and 162 W. of Gloucester. A body of Flemings was settled in the district by Henry I. in 1107. The castle, the keep of which is now used as a police-station, was erected by Gilbert de Clare, first Earl of Pembroke, in the 14th century. There are also remains of a 12th-century Augustinian priory. Paper-making is the chief industry. In 1885-1918 Haverfordwest was included in the Pembroke boroughs, which returned one member to the House of Commons. Pop. 6000.

Havergal, FRANCES RIDLEY, a popular hymn-writer, youngest child of Rev. W. H. Havergal, musical composer, and hon. canon of Worcester cathedral, was born 14th December 1836 at Astley, Worcestershire. A talented child, she familiarised herself with modern languages, tried Greek and Hebrew, and, developing her poetical gift, she gave utterance from time to time to many sweet and delicate religious strains of song. Her writings in poetry and prose have been popular with the religious public. Some of her hymns have found their way into church collections. She issued many such volumes as *Ministry of Song*, *Under the Surface*, &c. She died at Caswell Bay, Swansea, 3d June 1879. Her collected *Poetical Works* appeared in 1884, and her *Letters*, &c. in 1885. See *Memorials of Frances Ridley Havergal* (1880).

Haverhill, an ancient market-town in the south-west corner of Suffolk, 18 miles SE. of Cambridge. Pop. 4000.

Haverhill, a city of Massachusetts, at the head of navigation on the Merrimac River, 33 miles N. of Boston by rail. Its chief industry is the manufacture of boots and shoes; and there are manufactures also of iron, hats, glass, &c. Pop. 54,000.

Havers, CLOPTON (1655-1702), anatomist and physician, after studying at Cambridge and Utrecht, where he graduated, settled in London in 1687. His *Osteologia Nova, or Some New Observations of the Bones and the Parts belonging to them* (Lond. 1691), was long a standard work; and his name is perpetuated as the discoverer of the Haversian canals in Bone (q.v.). Other details of his life are not known.

Havildar, the highest rank of non-commissioned officer among native troops in India and Ceylon.

Havre, LE (a contraction of the original name LE HAVRE DE NOTRE DAME DE GRÂCE), a seaport of north-western France, in the department of Seine-Inférieure, and after Marseilles the chief port of the country, is situated on the north side of the estuary of the Seine, 143 miles NW. of Paris by rail. Havre is built on a level expanse facing the estuary, and apart from the church of Notre Dame, dating from the 16th century; the buildings, which include the Hôtel de Ville, the museum, and the law courts, are modern erections. Great breakwaters have been built, and enclose a fine system of docks, with inner and outer harbours. There are an ever increasing number of basins, with an area of more than 200 acres; while the cold-storage docks (the largest of which stores 7000 tons of meat) are among the most modern in the world. There are also repair and graving docks, and one apart for vessels carrying petroleum. Havre is in communication with the United States through the Compagnie Générale Transatlantique, and also with South America, Canada, the west coast of Africa, and other parts of the world, while there is daily communication with Southampton. The Tancarville Canal (16 miles) enables boats which cannot attempt the estuary to enter Havre from the river direct. Imports include coffee, cotton, cocoa, timber, hides, pepper, wool, copper, frozen meats, coal, and petroleum. The exports amount to much less than the imports, the more important being silk and cotton goods, perfumes, wines, furniture, coffee, hides, earthenware and glass, cocoa, and fancy goods. Havre possesses engineering and ship-building works, flour-mills, sugar refineries, dye, soap, tobacco, and chemical works. It owes much of its prosperity to the establishment of a market for futures, the transactions of which are controlled by a clearing house. The population from 85,407 in 1876 has risen to 163,374 in 1921.

Down to 1516 Havre was only a fishing-village. Its history as a seaport dates from the reign of Francis I., who built the harbour and fortified it. Havre was held for some months in 1562 by the English, who were expelled by Charles IX. after a hot siege. Louis XIV. made it a strong citadel, and it was several times bombarded by the English at varying dates from 1694 to 1795. Under Napoleon I. it was raised to a war harbour of the first rank, and later works begun by Louis XIV. were finished. In the Great War, after the landing of the original forces at Boulogne, Havre was the chief base through which the British army passed, and its large sheds and warehouses at the docks became hospitals, from which patients were embarked on the ships lying alongside. Mdle. de Sendéry was born at Havre.

Hawaii, or HAWAIIAN ISLANDS, a small archipelago in the North Pacific, forming a kingdom from 1779 till 1894, but in 1898 annexed to the United States. Called Sandwich Islands by Captain Cook after Lord Sandwich, then First Lord of the Admiralty, they are now named from the chief island. The islands, twelve in number, form a rich, beautiful, and interesting chain which runs from south-east to north-west, and lies in 19°

to 22° N. lat. and 155° to 160° W. long. Their total area is 6449 sq. m., or about that of Wales. The names and areas of the eight principal islands (the other four being merely barren rocks) are as follows: Hawaii (the 'Owhyhee' of Captain Cook), 4015 sq. m.; Maui, 728; Oahu, 598; Kauai, 547; Molokai (the 'Lepers' Island'), 261; Lanai, 139; Niihau, 97; Kahulau, 69.

Hawaii is the southernmost of the group; it is in shape a rough triangle, with the apex pointing north-west.

Geography, Mountains, Rivers, &c.—The Hawaiian Islands are situated on the course of ships passing from San Francisco and Vancouver Island to China and Japan, as well as to New Zealand and Australia. They lie in mid-ocean, between the coasts of Asia and America, but are nearer to the American coast, from which they are about 2100 miles distant; they consequently form a convenient station for the coaling and repairing of vessels on their way across the Pacific. The islands are of volcanic origin, with coral-reefs partly lining most of them, but entirely encircling none. They suffer from want of good harbours, the best being the harbour of Honolulu, situated on the island of Oahu, with 22½ feet of water in its shallowest parts. This harbour, which is entered through a narrow channel in the reef, is the only really well-protected harbour in the group; during the time of the trade-winds, however, which blow from north-east to south-west for about nine months in the year, the roadsteads on the south shores of the islands afford safe anchorage almost anywhere. The larger islands are mountainous, and contain some of the largest volcanoes, both active and extinct, in the world. The two highest mountains, Mauna-Kea and Mauna-Loa, are in the island of Hawaii, and are 13,805 and 13,675 feet high respectively. This island is also traversed by other mountains, which give it a rugged and picturesque appearance, and in places bold cliffs from 1000 to 3000 feet high front the sea. Speaking generally, however, the high ground in each of the islands is in the centre, and the mountains are divided by rich valleys leading down to a sandy shore. On the eastern slope of Mauna-Loa, in Hawaii, is the far-famed Kilauea, the largest active volcano in the world. It is over 4000 feet above sea-level. Its crater is of oval shape, 9 miles in circumference, bounded by a range of cliffs, and containing within it a fiery lake of molten lava rising and falling like the waves of the sea. Mauna-Loa itself is an active volcano, the scene of various eruptions, notably of one in February 1877, when the glare caused by the fiery outburst is said to have been plainly visible on the island of Maui, 80 miles distant. On Maui is the crater of Haleakala ('house of the sun'),

by far the largest known in the world. It is from 25 to 30 miles in circumference, from 2000 to 3000 feet deep, and is 10,032 feet above sea-level. Within this huge gulf are about sixteen basins of old volcanoes, whose ridges form concentric circles. Several of the islands, especially Hawaii and Kauai, are well supplied with rivers. These afford great facilities for irrigation, but owing to the small size and the conformation of the islands they are in no case navigable.

Climate, Soil, &c.—Lying as they do in the middle of the Pacific Ocean, the Hawaiian Islands, though within the tropics, enjoy a fairly temperate climate. In the hot season the temperature seldom rises above 90° F., while in the cool season it seldom falls below 52° F., the average temperature for the year being 74°-3° F. Rains, brought by the north-east trade-wind, are frequent on the side of the mountains which faces that quarter, but on the other parts of the islands little rain falls, and the sky is generally cloudless. The yearly rainfall at Honolulu, being on the leeward side of Oahu, is under 40 inches; that of the islands generally about 54 inches. The soil, whose constituent parts are mainly scorïæ, decomposed lava, and sand, is generally thin and poor, but at the bases of the mountains and in the valleys there are extensive tracts as fertile as they are beautiful. In Hawaii alone, on the Waimea plains, thousands of sheep of the merino breed find grazing ground; and on most of the islands, while the upland slopes of the mountains are clothed with dense forests, the lower levels spread into grassy plains rich with sugar and rice plantations.

Natural History, Products, &c.—The islands are separated from other lands by a broad expanse and great depth of sea, consequently their natural history has many special features of its own. In the high mountains there are some species of plants akin to those of the American continent. The forest-trees are mainly to be found on the windward, one of the most important being the algaroba. Sugar is far the most important product. Much rice is grown by the Chinese, and coffee by the Japanese. Of many fruits, the pineapple is the most important. Cotton, tobacco, and sisal are also grown, while rubber has been introduced. The staple food of the natives consists of *poi*, a kind of thick paste made from the root of the *taro* plant and raw or dried fish. The only indigenous mammals are rats, mice, and bats, but others have been added since white men came to the islands; cattle, sheep, &c., having been introduced by Vancouver and other navigators. Reptiles are few, including a few species of skinks and geckoes; and of the native birds many interesting species are extinct or disappearing, though foreign importations more than supply their place. In 1909 President Roosevelt established the chain of islands to the NW. as a bird colony. The archipelago has no mineral resources. Coral rock is the material chiefly used for building purposes, and to a less extent basalt, compact lava, and sandstone. There is a large variety of sea-shells, some of which are of exquisite beauty.

Trade, Finance, &c.—The commerce of the islands is gradually increasing. Up to the year 1876 the most important trade was that of the vessels engaged in the whale-fisheries of the Pacific, which now are almost extinct. In 1876 a Reciprocity Treaty was concluded with the United States, and since that date there has been an enormous development of the sugar export trade, which is the principal industry; the other chief articles of export being rice, coffee, sisal, pineapples, and bananas, with some minor products. In 1922-23 the total exports amounted to \$82,768,317, and the imports

to \$64,876,814. Much the largest item of this was of sugar to the United States (\$54,231,943). The exports to the United States totalled \$81,495,984; imports from the United States \$56,887,991. Of foreign countries Japan had much the largest trade, Chile, Great Britain, and Australia coming next. The tonnage entering the ports in 1922-23 was 6,580,557. There is an inter-island steamer service running frequently. Several lines of steamers connect the islands with the United States, Canada, Mexico, Australia, China, and Japan. There are about 1000 miles of railway, the first line having been opened in 1879. Telegraphs (wireless and other) have been established. The coins current in the islands are American dimes, quarter-dollars, half-dollars, and dollars. The total revenue in 1922-23 was \$14,329,827, and the expenditure \$13,533,817, the chief items being for public works, health, and instruction. The chief sources of revenue are customs and internal taxes. Education has made marked progress, the enrolment in the schools being in 1923 57,200.

History, Constitution, &c.—The islands are said to have been discovered by Gaetano in 1542, and rediscovered by Captain Cook in the year 1778. Cook met his death at the hands of the natives in Kealakekua (Karakakoa) Bay in the year 1779. In early times each island had a king, but under Kamehameha I. the islands were formed into one kingdom. He died in 1819, and was succeeded by Liholiho, who adopted on his accession the name of Kamehameha II., and whose reign was famous for the abolition of idolatry simultaneously throughout all the islands. Vancouver, who arrived with Cook in 1778, and returned in 1792 and again in 1794, had made sincere attempts to enlighten the islanders, and succeeded so far that he was requested by the king and his chiefs to send out religious teachers to them from England. The first missionaries, however, who visited the islands came from the nearer shores of America. On their arrival in 1820 they witnessed the singular phenomenon of a nation without a religion. The instructions of Vancouver had, it would seem, not been forgotten, and had opened the eyes of the idol-worshipping natives to the grotesque absurdities of their system. But the spontaneous movement of 1819-20 'was no triumph of Christianity—for Christianity had not yet claimed or even approached the Hawaiian Islands.' The nation had voluntarily cast off the religion of their ancestors, and had not yet adopted—were not even acquainted with—any other system. The missionaries were well received, and the work of instruction was at once begun. In less than forty years they taught the whole Hawaiian people to read and write, to cipher and sew. Kamehameha II. and his queen visited England, and both died in London in July 1824. Prior to the year 1838 the government was a simple despotism, but in 1840 Kamehameha III. granted a constitution consisting of king, assembly of nobles, and representative council. In 1843 the independence of the Hawaiian kingdom was formally guaranteed by the French and English governments. Kamehameha IV. (1854-63) was succeeded by his brother Kamehameha V., with whose death in 1873 the line of the Kamehamehas became extinct, a high chief, Lunalilo, being elected to the vacant throne. On his death in 1874 another high chief, Kalakaua, was elected king. About 1886 the unsatisfactory state of the public finances under the existing system demanded some measure of reform, and in 1887 the king was called upon to dismiss his cabinet and constrained to grant a more popular constitution. In January 1893 the queen Liliuokalani, sister of Kalakaua I., who had reigned for two years, was dethroned by a revolution. An-

nexation to the United States failing through the opposition of President Cleveland, a Republic was inaugurated in 1894. In 1898, however, the islands were formally annexed to the United States, and in 1900 the territory of Hawaii was organised.

Population and Condition of the People.—The total population of the islands in 1900 was 153,727, in 1910 191,905, and in 1920 255,912, Oahu (with Honolulu, pop. 83,327) having over a third of the whole. The number of Hawaiians was 21,468 in 1923 (a decrease since 1910 of 4632), and of part-Hawaiians (Caucasian-Hawaiian and Asiatic-Hawaiian, an increasing element) 19,888. There were 23,714 Chinese and 120,590 Japanese; Philipinos, 36,199; Americans, British, and Germans, collectively, 35,774; Portuguese, 26,377; Porto Ricans, 6375; and Spaniards, 2105. Under the control of the United States government the immigration of Chinese and Japanese has been prohibited, although the sugar-planters are anxious to get them. The natives belong to the brown Polynesian stock, and are akin to the New Zealand Maoris in race and language. They were once far more numerous than at present, having, it is said, at the time of Captain Cook's visit numbered probably some 200,000. There is no doubt that they have rapidly decreased, while the number of foreigners in the islands is continually increasing. Physically the Hawaiians are a remarkably fine and handsome race. In character they are indolent, joyous, and contented. The dress of the native men, where they have not adopted 'civilised' attire, consists merely of a wide strip of cloth round the loins, while the native women dress in a long ungirdled gown ('holoku') reaching from the neck to the ankles. Excellent day-schools have been established all over the islands, and there are very few natives who cannot read and write in their own language.

The decrease of the native population is due in part at any rate to the introduction of foreign diseases. Phthisis, though not so devastating as in some Pacific islands, answers for a high mortality. Leprosy (q.v.) is also prevalent. See MOLOKAI.

Large dry docks have been established at Honolulu on the island of Oahu, and at Pearl Harbour near by a great naval station has been established. The islands for their beauty and excellent climate are visited by increasing numbers each year.

See W. D. Alexander, *History of the Hawaiian People* (1892); Queen Liliuokalani, *Hawaii's Story* (1898); H. H. Gowen, *Kamēhameha, Napoleon of the Pacific* (1919); W. F. Blackman, *The Making of Hawaii* (1906); W. R. Castle, *Hawaii, Past and Present* (1916); W. A. Bryan, *The Natural History of Hawaii* (1916); J. F. Rock, *The Indigenous Trees of Hawaii* (1917); Sharp and others, *Fauna Hawaiiensis* (3 vols. 1898-1913); C. H. Hitchener, *Hawaii and its Volcanoes* (1911); W. T. Brigham, *The Volcanoes of Kilauea and Maunaloa* (1909); C. K. London, *The New Hawaii* (1923).

Hawarden (pronounced *Harden*), a small market-town of Flintshire, North Wales, 7 miles W. of Chester. There are some manufactures of tiles, pottery, &c. Lady Hamilton passed her girlhood here. The church, almost destroyed by fire in 1857, was restored from designs by Sir G. G. Scott. Hawarden Castle, Mr Gladstone's seat, dates from 1752. The park contains the ruined keep of a 13th-century castle commanding a fine view of the Dee.

Hawash, a river of Abyssinia (q.v.).

Hawes, STEPHEN, born probably in Suffolk, was groom of the chamber to Henry VII., and wrote, besides some half-dozen other works in prose and verse (now bibliographical rarities), *The Passetyme of Pleasure* (first printed by Wynkyn de Worde in 1509), a prolix poem not without fine stanzas,

which doubtless helped to inspire Spenser. There have been reprints in 1831, 1845, &c. Hawes died probably in 1523.

Hawfinch (*Coccothraustes vulgaris*), one of the largest of the Finch family (Fringillidæ), widely distributed in Europe, in Africa north of the Atlas, and in Asia from Palestine to Japan. It breeds regularly in England, usually nesting on lichen-covered trees, but being very shy it is not much noticed. The coloration is suggestive of a chaffinch, but the hawfinch is an inch longer, and the huge nearly conical bill, very thick at the base, tapering rapidly to the point, is very characteristic. This strong bill crushes the 'stones' of fruit like haws and cherries, the husks of beech-nuts, the seeds of hornbeam and the like, not to speak of peas. The young are fed largely on caterpillars.

Hawick, a manufacturing town of Roxburghshire, at the confluence of the Slitrig with the Teviot, 52 miles by rail SSE. of Edinburgh and 45 NNE. of Carlisle. Built in and round a hollow, with villas and mansions above, it is a place of hoar antiquity, but bears few traces thereof beyond the Moat, an artificial earthen mound 30 feet high and 312 in circumference, and part of the Tower Hotel, which, once the peel-tower of the Drumlanrig Douglasses, and later a residence of Monmouth's widowed duchess, was the only building not burned by the Earl of Sussex in 1570. In the neighbourhood are Branksholm and Harden, old homes of the Scotts; and, older than either, there is the refrain of the June Common-riding song, 'Teribus ye Teri Odin,' which carries us back to days of heathendom. Else, all is modern—the handsome municipal building; the churches, more than a dozen in number, and the oldest (1214) rebuilt in 1763; and the hosiery and tweed mills, to which, with dye-works, tanneries, &c., Hawick owes its prosperity. The hosiery manufacture dates from 1771, and that of shepherds' plaids, tweeds, blankets, &c., from 1830. The ancient municipal constitution of the burgh, based on a charter granted by Sir James Douglass of Drumlanrig in 1537, and confirmed by Queen Mary in 1545, was reformed by special act of parliament in 1861; and in 1867-1918 Hawick, Selkirk, and Galashiels (the Border burghs) returned one member. Pop. (1861) 10,401; (1891) 19,204; (1911) 16,877; (1921) 16,353. See two works by James Wilson (1850-58), and Mrs Oliver's *Upper Teviotdale and the Scotts of Buccleuch* (1887).

Hawk, a name often given to almost all the Falconidæ except the largest eagles, but also used in a more restricted sense to designate the Accipitrine section of the family, and for the most part referable either to the goshawks (Astur) or the sparrowhawks (Accipiter). Unlike the true falcons, they have an untoothed bill. The wings are short, somewhat rounded, and very concave beneath, and while the flight is rapid it is without much power of soaring or gliding. See FALCON, FALCONIDÆ, GOSHAWK, SPARROW-HAWK.

Hawkbit (*Leontodon*), a genus of plants of weedy aspect belonging to the natural order Compositæ, closely related to and formerly united with Dandelion (q.v.), from which it has been separated on account of the feathery pappus. The name is due to the deep tooth-like lacerations of the leaves. Several species are natives of Britain, and these, along with a few others comprised in the genus, are widely distributed in Europe and Russian Asia.

Hawke, SIR EDWARD, LORD HAWKE OF TOWTON (1705-81), was the son of a lawyer of good middle-class stock. He was born in 1705 in London, and entered the navy while very young. The long quiet which followed the peace of Utrecht gave him no opportunity of seeing

active service. He, however, attained the rank of commander in 1733. In 1744 he commanded the *Berwick* (70 guns) in the fleet under Admiral Mathews which was lying at Hyères Bay to watch the combined French and Spanish fleets in Toulon. In the disgracefully-conducted battle of the 11th February of that year the *Berwick* was one of the few ships which were handled with spirit. Hawke followed his admiral in bearing down out of the line of battle to attack the Spanish ships which formed the rear of the allied fleet. This movement was considered irregular according to the pedantic tactical rules of the time, and, conjoined with his own violent conduct to his subordinate Lestock, proved ruinous to Admiral Mathews. But Hawke established his reputation as a daring officer. The Spanish line-of-battle ship, the *Poder*, the only vessel captured, surrendered to the *Berwick*; and it was not Hawke's fault that she was retaken by the enemy. In 1747 he was made rear-admiral of the white squadron, and the same year was despatched with a fleet of fourteen sail to intercept a French convoy of 252 merchant ships known to be leaving for the West Indies. On the 14th October Hawke caught the convoy off Cape Finisterre. It was guarded by a squadron of nine ships of war under M. L'Etenduère. The French admiral formed line of battle, and fought heroically to save his charge. The odds were great—fourteen English ships with 784 guns to nine French with 556—and after desperate fighting six of L'Etenduère's ships struck. But he saved his convoy, which fled during the battle. In the same year Hawke became member of parliament for Bristol. By 1755 he had attained the rank of full admiral. In the following year he was sent out to supersede the unhappy Byng, who had just disgraced himself and his country at Minorca. There was, however, nothing to do in the Mediterranean. During 1757 and 1758 he was in command in the Channel directing the naval half of the combined operations on the French coast sent out by the elder Pitt. His great feat—one of the greatest ever performed by a British admiral—came in 1759. During that year the French were preparing fleets at Brest and Rochefort to cover an invasion of England. The Brest fleet, the more powerful of the two, under the command of M. de Conflans, consisted of twenty ships carrying 1412 guns. It was watched by Hawke with a fleet of twenty-three ships carrying 1666 guns. On the 14th November the English fleet was driven off its station by a succession of furious gales, and M. de Conflans seized the chance to slip to sea. Hawke, who had anchored at Torbay, had, however, left lookout frigates, by whom he was informed of the sailing of the French admiral. Concluding at once that M. de Conflans would make for Rochefort, Hawke steered to cut him off at Quiberon. His calculation proved accurate. On the 20th November he caught the French, and, although it was blowing a fresh gale, attacked at once. The battle was one of the most heroic ever fought on sea. In a gale of wind, on the afternoon of a November day, and with one of the most terrible coasts in the world under his lee, Hawke forced on a close action. A famous story tells how his sailing-master expostulated at the order to take the flag-ship, the *Royal George* of 100 guns, into the dangerous Bay of Quiberon in such a gale and in the dark, and how Hawke replied: 'Mr Robinson, you have done your duty in pointing out the danger; you are now to obey my orders, and lay me alongside the French admiral.' The result was the destruction of the French fleet, and the collapse of the invasion scheme. It is curious that Hawke, who had been made a knight for the capture of L'Etenduère's squadron, did not receive the peerage this victory

so well deserved till 1776, when he was made Baron Hawke of Towton. It is just possible that the freedom with which he rebuked the Admiralty for its management of the fleet may have had something to do with the delay. He was First Lord himself in the administration of 1765, but had no further chance of distinguished sea service. He died at Shepperton, Middlesex, 17th October 1781. See the excellent Life by Professor Captain Montagu Burrows (1883).

Hawker, ROBERT STEPHEN, the Cornish poet, was born at Plymouth, December 3, 1803. His father, then a physician, afterwards took orders; his grandfather, the Rev. Robert Hawker, D.D. (1753-1827), the author of the well-known *Morning and Evening Portions*, was for fifty years a vicar in Plymouth. He was a bright boy, notable especially for high spirits and an inveterate love for practical jokes. He had his education at Liskeard and Cheltenham grammar-school, and entered Pembroke College, Oxford, in 1823; but his father, now a curate, soon found himself unable to keep him at Oxford. Fortunately this difficulty was obviated by the lad's own marriage (November 1823) to a lady of some fortune. He was not yet twenty-one, while his wife, Miss Charlotte l'Ans, who had been his godmother, was forty-one. With her he returned to Oxford, migrating to Magdalen Hall. He carried off the Newdigate in 1827, took his B.A. in the following year, was ordained priest in 1831, and was presented by Bishop Phillpotts in 1834 to the vicarage of Morwenstow, a small village on the wild north Cornish coast, 6 miles N. of Bude Haven. Here he laboured with devotedness for forty years, lavishing charity from his slender means upon shipwrecked mariners and his own poor alike. There had been no resident vicar for a hundred years, the quaint old church and the vicarage were in ruins, and the parishioners were demoralised by generations of wrecking, smuggling, and spiritual ignorance. Hawker rebuilt his vicarage, restored his church, roofing it anew with shingles in spite of all advice and opposition; built and maintained a school; introduced the strange innovations of a weekly offertory and a harvest-thanksgiving, as well as a striking ceremonial largely of his own devising, and more often suggesting the usages of the Eastern than the Western Church. Yet he never felt any affinity with the modern Ritualists, but indeed he was in every sense a man difficult to class. His zeal was hot against Wesleyanism and every form of dissent, for his sympathies did not range wider than his knowledge. He himself shared many of the superstitions of his people, believing in the manifestations of spirits and in the influence of the evil eye. The spiritual world was very near and real to him: St Morwenna was no mere member of the choir invisible, but an influence that could still affect his everyday life. All his eccentricities were redeemed by his humanity, his humour, and his tender love for children and for animals. His manner in preaching is described as rapt and awe-inspiring; but his theology sadly lacked logic and consistency. The theologian cannot afford to allow his judgment to be dominated by fancy, but in poetry the case is altogether different. Here Hawker is absolutely delightful, with simple unsought pathos and exquisite imagery moulded into faultlessly graceful form. He has both the gifts of sweetness and sonority, and withal manly strength and vigorous phrase at will. His *Tendrils by Reuben*, published at seventeen, he had the good sense not to reprint; but by his Cornish ballads in *Records of the Western Shore* (1832; a second series in 1836) he stamped himself unmistakably a poet. These were republished in *Ecclesia* (1840); with some additions, as *Reeds shaken by the Wind* (1843; a second cluster

in 1844); and yet again, along with *Genoveva*, in *Echoes of Old Cornwall* (1846). In 1869 he republished his earlier poems in *Cornish Ballads*, and the *Quest of the Sangreal*—the latter had already appeared in 1863. His *Footprints of Former Men in Cornwall* (1870) was a collection of miscellaneous papers on local traditions. None of Hawker's poems is better known than his spirited ballad based on the old Cornish refrain 'And shall Trelawny die?' which both Sir Walter Scott and Lord Macaulay took at first for a genuine antique.

Hawker's wife died in February 1863—a blow which drove him to melancholy and opium, from which he was saved only by his marriage (December 1864) to Miss Pauline Kuczynski, daughter of a Polish refugee by an English mother, and then a governess in a clerical friend's house. She bore him three daughters, and tenderly nursed his declining years. Hawker died at Plymouth, 15th August 1875, having been admitted a few hours before to the Roman Catholic communion.

The biography by the Rev. S. Baring-Gould (1876; 4th ed. 1899) was severely attacked; even less satisfactory was that by the Rev. F. G. Lee (1876); the definitive *Life and Letters* by C. E. Byles, his son-in-law, appeared in 1905. There are editions of the poems (with *Life*, 1879) and of the prose works (1893) by Godwin, of the poems by Wallis (1899), and of the *Cornish Poems and Ballads* by Byles (1904), and of *Stones Broken from the Rocks* (extracts from his notebooks), by Appleton and Byles (1922).

Hawkers, also called **PEDLARS**, or **PETTY CHAPMEN**, persons who go from town to town, or door to door, selling goods, wares, or merchandise, or exercising their skill in handicraft. A considerable change has been made by recent legislation in regard to this class. Those pedlars exercising their calling entirely on foot have been separately dealt with from hawkers who employ one or more beasts of burden in their business. The foot-pedlars are placed under the surveillance of the police, and are exempt from excise duty. Under the Pedlars Act, 1871, any person whatever who can satisfy the chief officer of police of the police district in which he resides that he is of good character, is above seventeen years of age, and has resided during the previous month in the district, will receive, on due application, a certificate valid for a year, on payment of five shillings. The Pedlars Act, 1881, provides that such a certificate shall entitle the holder to exercise his calling in any part of the United Kingdom. The police have power at any time to open and search the packs, &c. of any certificated pedlar, with a view to prevent dishonesty and smuggling, &c., for which they have much opportunity. They have an appeal to the local Justice of Peace and other courts against oppression by the police.

Hawkers who use beasts of burden, and hawkers who go from place to place, hiring rooms or booths for the exhibition of their wares, are in a different category. The Hawkers Act, 1888, requires them to take out an annual or half-yearly license from the excise, which is valid all over the kingdom. These licenses are at the rate of £2 per annum; new licenses are granted only on a certificate of good character. A hawker is in no case entitled to sell spirits, but he may sell tea and coffee. He must not sell plated goods without taking out a plate license, nor must he sell by auction without an auctioneer's license. Any person hawking unprovided with a license, or who refuses to produce the license to any person who calls for it, is liable to penalties under the Act of 1888. Commercial travellers, book-agents, sellers of fruit, fish, victuals, or coal, also sellers in fairs or markets legally established, do not require either licenses or certificates, though it must be sometimes difficult to

define whether a seller comes within the category of a pedlar or hawker.

In the United States hawkers are generally required to take out licenses, under the local laws of the several states, and to conform to regulations such as wearing a badge displaying their license number.

Hawke's Bay, a provincial district of New Zealand, on the east coast, between Auckland and Wellington. Area, 4241 sq. m.; pop. (1921) 60,925. It presents rich alluvial plains and undulating hills, with enormous forests. The bay known as Hawke's Bay was first entered by Captain Cook on 8th October 1769, and was so named after Sir Edward Hawke, then First Lord of the Admiralty. It is almost all suitable for farming, and the forests are of enormous extent. Napier (q.v.) is the port and chief city.

Hawkesbury, the name given to the lower course of a river in New South Wales, 335 miles long, which, under the name of Wollondilly, rises in the main range near Goulburn, and runs northwards through deep gorges to join the Cox. Thence, under the name of Warragamba, it continues its course to the junction of the Nepean, and under that name to the inflow of the Grose. Thence it is called Hawkesbury, and after a further northward course to Wiseman's Ferry turns south-east to the magnificent estuary of Broken Bay, about 20 miles north of Port Jackson. Except for a short length of the 'Nepean,' it traverses rugged country; but the damming of the 'Warragamba' will provide not only copious irrigation for the fertile country west of Sydney, but millions of gallons will be available for domestic and trade uses in Sydney. The Hawkesbury is crossed by a steel girder bridge (1886-89) on the railway between Sydney and Newcastle, one of the largest structures of its kind in the world, having seven spans of from 410 to 416 feet, and a total length between abutments of 2900 feet. The bridge completes the system of railway communication between Brisbane and Adelaide.

Hawkesworth, **JOHN**, miscellaneous writer, was born in London, probably in 1715, but according to another account in 1719. Little is known of his early life, but he is said to have been apprenticed successively to a clockmaker and to an attorney; and for his education he was mainly indebted to his own perseverance. In 1744 he succeeded Dr Johnson on the *Gentleman's Magazine*; and in 1752 he started, with Johnson and others, a successful periodical called *The Adventurer*, half of whose 140 numbers were from Hawkesworth's own pen. As a reward for its services in the cause of morality he received from the Archbishop of Canterbury the degree of LL.D. He afterwards published a volume of fairy tales (1761), and an edition of Swift's works and letters, with a *Life* that Johnson praised highly; and he was chosen by Captain Cook to prepare the account of his first voyage, which formed vols. ii. and iii. of Hawkesworth's *Voyages* (3 vols. 1773), for which work the editor received £6000 from government. He died on 17th November 1773. Hawkesworth was too ardent an admirer of Johnson to attempt consciously to imitate him or to avoid doing so unconsciously. Yet his chief service to literature was that he introduced into the popular oriental fictions of the 18th century the ease of familiar writing, and so put an end to the long succession of dreary and bombastic narratives that strutted far behind in the track of *Rasselas*.

Hawking. See **FALCONRY**.

Hawkins, **SIR ANTHONY HOPE**, novelist, known better as Anthony Hope, was born in London, a clergyman's son, 9th February 1863, and educated at Marlborough and Balliol, took a

classical first in 1885, and was called to the bar in 1887, but gave up practice in 1894. His first novel was *A Man of Mark* (1890). It was followed by *The Prisoner of Zenda* (1894), *Dolly Dialogues* (1894, 1902), *The God in the Car* (1894), *The Princess Osva* (1896), *Phroso* (1897), *Rupert of Hentzau* (1898), *The Adventure of Lady Ursula* (a comedy, 1898), *Quisante* (1900), *Tristram of Blent* (1901), *The Intrusions of Peggy* (1902), *Pilkerton's Peerage* (a play, 1902), *Double Harness* (1904), *A Servant of the Public* (1905), *The Great Miss Driver* (1908), *Second String* (1910), and other works. He was knighted in 1918.

Hawkins, SIR HENRY (BARON BRAMPTON), born at Hitchin, 14th September 1817, and educated at Bedford, became a Q.C. in 1858, and a judge of the High Court of Justice in 1876, the same year being transferred to the Exchequer Division and knighted. He retired in 1898, was made a baron in 1899, and died in 1907.

Hawkins, SIR JOHN, an English navigator, was born at Plymouth about 1532. He has the unhappy distinction of being the first Englishman that trafficked in slaves (1562). His 'commercial' career closed with his disastrous third voyage (1567), after which we find him more honourably employed. He was appointed treasurer of the navy in 1573, knighted for his services against the Spanish Armada in 1588, and for the rest of his life was engaged in making havoc of the Spanish West Indian trade. In 1595, along with his kinsman Drake, he commanded an expedition directed against the settlements in the Spanish Main, but died at Porto Rico on 21st November. See Hakluyt's *Voyages*, Purchas's *Pilgrimages* (iv.), Froude's *English Seamen of the 16th Century* (1901), and E. A. J. Walling's *Sea Dogs of Devon* (1907).

Hawkins, SIR JOHN, born at London 30th March 1719, was a descendant of the famous admiral. Bred an attorney, he acquired a fortune through his wife, and withdrew from professional work; and, becoming an active magistrate, was knighted for his services in connection with riots in 1763 and 1769. He collected a most valuable musical library, and after sixteen years of laborious research produced in 1776 his *General History of the Science and Practice of Music*, in 5 vols. quarto—a work of admittedly great and accurate scholarship, somewhat unsystematic and tedious, and as a literary performance decidedly inferior to Burney's *History* (which began to appear at the same time). It was much abused and ridiculed, but is a work of permanent value, and was reprinted in 2 vols. in 1876. In 1760 Hawkins issued an edition of Walton's *Angler*. An original member of Dr Johnson's Ivy-lane Club, Hawkins became on Johnson's death his literary executor, and published in 1787 a *Life of Dr Johnson* and an edition of his works. He died 21st May 1789.—His son, JOHN SIDNEY, published a history of Gothic architecture; his daughter, LÆTITIA, her own *Memoirs*, with many anecdotes of Dr Johnson.

Hawkins, SIR RICHARD, British seaman, was born about 1562, son of Sir John Hawkins (q.v.), sailed with Drake and with his father, commanded a ship against the Armada, and in 1593-94 his own ship the *Dainty*, visited Brazil, passed the Straits of Magellan, and plundered Valparaiso. Taken prisoner in 1594 by the Spaniards, he was released in 1602. He was knighted in 1603, and in the next year became vice-admiral of Devon and member of parliament for Plymouth. 1620 saw him as vice-admiral in the expedition against the Algerian pirates. He died in 1622. See his *Observations in his Voyage into the South Sea* (1622; reprinted by the Hakluyt Society).

Hawk-moths (*Sphingidae*), an important family of moths, with stout body, with wings small in proportion (the hind pair showing at the base a bristly 'frenulum' loosely linking them to the front pair), with thick antennæ pointed at the tip. Many are of large size. The caterpillars are remarkable in colouring, marking, and attitudes, which are often apparently of protective value; the anterior segments are capable of great retraction; there is usually a prominent horn on the eleventh segment; there are no conspicuous hairs except during the first stage; the pupa comes to rest in the earth, and no cocoon is spun. Some hawk-moths produce sounds, both as

Caterpillar of Humming-bird Hawk-moth (*Macroglossa stellatarum*).

larvæ and adults; in the case of the adult Death's-head Moth this seems to be due to a friction of the palps against the proboscis. Some South American forms are so like humming-birds that an experienced collector like Bates several times shot the insect in mistake for the bird. The recurrent report of humming-birds in the south of England is due to the presence of *Macroglossa stellatarum*, one of the Humming-bird Hawk-moths. Among the other British species may be mentioned the Death's-head Hawk-moth (q.v.) or *Acherontia atropos*, the Poplar Hawk-moth (*Smerinthus populi*), the Eyed Hawk-moth (*S. ocellatus*), the Privet Hawk-moth (*Sphinx ligustri*), whose resting larva poses in an

Humming-bird and Humming-bird Hawk-moth (*Macroglossa titan*) (after Bates).

attitude which suggested the mythological Sphinx to the old naturalists. See South's *Moths of the British Isles* (1907).

Hawks, FRANCIS LISTER, an American clergyman, born at New Berne, North Carolina, 10th June 1798, practised law for a time with success, but in 1827 was ordained to the Episcopal ministry. He was professor of Divinity at Washington (now Trinity) College, Hartford, in 1830-31, and afterwards rector of churches in New York, New Orleans, and Baltimore. He died in New York, September 26, 1866. In 1836 he went to England, and there obtained 18 folio vols. of MSS. relating to the Episcopal Church in America, of which he had been appointed historiographer. In 1836-39 he published 2 vols. of *Contributions to the Ecclesiastical History of the United States*, dealing with Virginia and Maryland. Among his other works are a *Commentary on the Constitution and Canons* (1841), and, with Bishop Perry, *Documentary History of the Protestant Episcopal Church* (vols. i. and ii. 1863-64);

and he edited Alexander Hamilton's state-papers (1842), Commodore Perry's *Expedition to Japan* (1852-54), and Appleton's *Cyclopædia of Biography* (1856).

Hawksbeard (*Crepis*), a genus of annual and biennial plants belonging to the natural order Compositæ, so closely related to Hawkweed (*Hieracium*) that some of the species are referred to the one genus or the other according to the peculiar views of individual botanists. The species are widely distributed through Europe and Asia.

Hawksbee, or **HAUKSBEE**, FRANCIS, physicist, was already a well-known experimentalist when in 1705 he was admitted a Fellow of the Royal Society, and he died soon after 1713. (Not to be confused with him is Francis Hawksbee the younger, 1687-1763, apparently his son, who was also an electrician and skilled instrument-maker, and was in 1723 appointed clerk and housekeeper to the Royal Society.) Hawksbee the elder carried further the tentative observations by Dr Gilbert and Boyle on the subject of electricity, and by his experiments laid the scientific foundations of that branch of knowledge. He contributed forty-three memoirs to the *Philosophical Transactions*, chiefly on chemistry and electricity, between 1704 and 1713. His chief independent work, published in 1709, was entitled *Physico-Mechanical Experiments on various Subjects; touching Light and Electricity producible on the Attrition of Bodies*. He is also well known as the improver of the earlier air-pumps of Boyle, Papin, and Hooke, and as the first who used glass in the electrical machine.

Hawkshaw, SIR JOHN (1811-1891), railway engineer, built the Severn Tunnel, one of the greatest undertakings of the century.

Hawkweed (*Hieracium*), a genus of plants of the natural order Compositæ, sub-order Cichoraceæ.

Orange Hawkweed
(*Hieracium aurantiacum*).

The species are perennial herbs of no popular interest with the exception of the Orange Hawkweed (*H. aurantiacum*), a native of the south of Europe, which on account of its handsome orange flowers is frequently cultivated in gardens. The species (about a hundred in Britain) and the innumerable varieties are exceedingly difficult to determine. The name is connected with an ancient belief that birds of prey used the juice of some plant to strengthen their vision. The English name *Hawkweed*, the German *Habichtskraut*, and the French *Épervière* are alike translations of the Greek *hierakion* (*hierax*, 'hawk'), applied in the usual random fashion to this genus.

Hawkwood, SIR JOHN, Italianised L'AGUTO or L'AGUTO, an English captain who won great renown and much riches as a condottiere in Italy in the wars of the 14th century, was the son of a well-to-do tanner of Sible Hedingham, in Essex. Having embraced the calling of arms, he distinguished

himself at the battles of Crécy and Poitiers, thereby winning the favour of the Black Prince; he was knighted by Edward III. After peace was signed at Bretigny (1360) he gathered a band of mercenary soldiers and led them to Italy, where he at first took service with Pisa against Florence. Then, after fighting in most of the petty Italian wars of the period, notably for the Visconti and for Pope Gregory XI., he agreed to fight the battles of Florence in return for an annual pension. His last years were spent in the neighbourhood of Florence, and there he died in 1394, and was honoured with a magnificent public funeral. See Nichol's *Bibl. Topog. Brit.*, vol. vi.; Temple Leader and Marcotti's *Life* (Eng. trans. by Mrs Leader Scott, 1889); and *Quarterly Review* (Jan. 1890).

Haworth, a moorland village in the West Riding of Yorkshire, 4 miles SSW. of Keighley by a branch-line. The old church has been ruthlessly demolished, but in the churchyard are the graves of Charlotte and Emily Brontë. It has had an urban district council since 1894. Pop. 6600. See *Haworth, Past and Present* (1889).

Hawse (akin to Icel. *hals*, 'the neck'), part of a vessel's bow, in which the *hawse-holes* are cut. Through the hawse-holes the cables pass which hold a vessel when she is moored with two anchors out forward.—*Hawser* is a small cable or a large rope.

Hawthorn (*Crataegus Oxyacantha*; see CRATÆGUS), a shrub or small tree, a native of Europe, Siberia, and the north of Africa, common in Britain, and much planted both for hedges and for ornament. It varies in height from 6 or 8 to 20 or 25 feet. It has roundish obovate three- to five-lobed deciduous leaves, and corymbs, generally of white, rose-coloured or sometimes deep crimson flowers, succeeded by a small red fruit (*haws*) with yellow pulp, the central stony part bearing a very large proportion to the pulp. There are many varieties of hawthorn, and, curiously enough, some have only one style, whilst some have several. The variety called Glastonbury Thorn—because supposed to have originated at Glastonbury (q.v.)—is remarkable for its early flowering, which often takes place in the middle of winter, whilst the common kind is not in flower till May or June. The winter flowers of the Glastonbury variety are, however, not generally followed by fruit, and a second flowering often takes place in the same year. The common hawthorn is often popularly called *May*, from the season of its flowering in England. It is also called *Whitethorn*, in contradistinction to the Sloe or Blackthorn. The perfume of the blossoms is strong but delicious. The use of the hawthorn for hedges is almost universal in Britain. It has also sometimes been employed as a stock on which to graft apples and other Pomaceæ. Several double-flowered and select single-flowered varieties are propagated by budding and grafting for the adornment of lawns and pleasure-grounds. A fermented liquor, which is very intoxicating, is made from the fruit in many parts of France. For the Cockspur Thorn of North America, and the Pyracanth Thorn, see CRATÆGUS.

The hawthorn is particularly valuable as a hedge-plant, in consequence of its strong and plentiful spines, its long life, and its ready adaptation to very various soils. For this purpose it is propagated by seed; the haws are laid in a heap to rot, with a mixture of sand or fine mould, and, in a year or sixteen months after, the seeds are sown in ground carefully prepared. The young plants are kept clear of weeds, and often grow to the height of a foot or two feet in the first season (see HEDGE). Hawthorn hedges bear trimming very well. Young hawthorn plants are called

quicks or *quickssets*, because used to make living (*quick*) fences.

An old English tradition regards Christ's crown of thorns as made of hawthorn; for the same reason the French call it 'l'épine noble.' In south Germany the tradition pointed to blackthorn, as elsewhere to some kind of buckthorn. Whitethorn was much favoured by fairies, old and lonely thorn-trees being regarded as their trysting-places.

Hawthorne, NATHANIEL, American author, born July 4, 1804, at Salem, Massachusetts. He was descended from English Separatist stock (spelling their name Hathorne; the *w* was Nathaniel's own addition); and their character seems to have made an early and enduring impression on his thoughts. This impression did not lead him to follow out and exemplify in his own career their modes of action, but rather caused him to turn and reflect upon the nature of his predecessors and the conditions amid which they lived. Probably we owe to this inclination the singular interest and penetrating quality of vividness with which he imbued his scenes from early New England life; and the intensity of concentration which he applied in dealing with moral problems in his romances reveals in him the character of the modernised Puritan. The first American Hawthorne (or, as the name was then spelled, Hathorne) was William, who migrated from England (Wiltshire?), in 1630, to Salem in New England, where he became a leader of the colonial soldiery and a magistrate, distinguished for both bravery and eloquence. 'The figure of that first ancestor,' wrote Hawthorne, in his sketch of *The Custom-house*, 'invested by family tradition with a dim and dusky grandeur, was present to my boyish imagination as far back as I can remember.' William Hawthorne took part in the persecution of the Quakers. His son John, also a military officer and magistrate, presided at the famous trials of the Salem witchcraft cases. Daniel, the author's grandfather, was a member of an American regiment, and also commanded a privateer, in the war of the Revolution against Great Britain.

Daniel's son Nathaniel, 'a silent, reserved, severe man, of an athletic and rather slender build, and habitually of a rather melancholy cast of thought,' became a captain in the merchant marine; the family having suffered a decline of fortune, and the male members mostly following the sea. He died when his son Nathaniel, the subject of this article, was but four years old. His widow, a woman of great refinement and religious sensibility, lived always afterwards in close retirement and straitened circumstances, with her two daughters and her son Nathaniel, who, from his ninth to his thirteenth year, was somewhat confined by an accidental lameness. His intense love of reading was doubtless fostered by these conditions. At fourteen he went with his mother to a lonely farm in the woods of Raymond, Maine; forming there, as he thought, that habit of solitude which became one of his permanent traits, but was probably inherited in part from his father. He was, however, a healthy, happy lad, given to outdoor sports and exercise, and quite free from morbidness in spite of his fondness for solitude. In Raymond he began to keep note-books, recording his observations; a practice which he resumed in later life and continued through the greater part of his career. At Bowdoin College, where he graduated in the class of 1825, with the poet Longfellow, he took a good rank, and gave pronounced signs of his tendency to authorship, having begun his first novel during his undergraduate course. But the conditions in the United States were at that period unfavourable to authorship as a profession, and his progress was slow. After his re-

turn to Salem he shut himself up for twelve years 'in a heavy seclusion,' writing tales and verses. Of the latter few have survived. In 1828 he published anonymously his first novel, *Fanshawe*, which was unsuccessful. Continuing to contribute to annuals and magazines, under various pseudonyms that made it still more difficult for him to become known, he edited in 1836 a short-lived periodical for S. G. Goodrich, for whom also he wrote *Peter Parley's Universal History*, an enormously profitable publication, of which Goodrich figured as the author and took the proceeds, while Hawthorne received only one hundred dollars.

Meanwhile some of his short fictions had gained such favourable notice from the London *Athenaeum* that in 1837 a group of them, to which he gave the name *Twice-told Tales*, was issued in one volume, the risk of which was assumed, without the knowledge of Hawthorne, by his friend and classmate, H. N. Bridge. This book, which an impartial and competent critic has said 'marked a distinct epoch in American literature,' was reviewed with high praise by Longfellow, and substantially made the beginning of Hawthorne's fame. Yet he still had long to wait for its fulfilment. The full force of the new author's genius was by no means appreciated in his own country; and diligent though he was with his pen, he was still unable to live by it. In January 1839 the historian Bancroft, then collector of the port of Boston, appointed him weigher and gauger in the custom-house, which post he held until early in 1841. In April he allied himself with an industrial association at Brook Farm (q.v.), near Boston, founded by Dr George Ripley (afterwards a distinguished critic), with a number of highly cultivated men and women, among whom were George William Curtis, Charles A. Dana, and Margaret Fuller. The object was to establish an idyllic, semi-socialistic community, in which every member should do manual labour and share profits in common, while carrying on his or her chosen intellectual work, and maintaining in the community a separate single or family life. Hawthorne, who was about to marry, had some hope of making his home here, but finding the experiment unsatisfactory he withdrew. Meanwhile he wrote and published in three parts a series of simple stories for children, from New England history—viz., *Grandfather's Chair*, *Famous Old People*, and *Liberty Tree* (1841). In July 1842 he wedded Sophia Amelia Peabody, of Salem, his union with whom became one of the rarest and most beautiful chapters in the annals of happy marriages. No account of Hawthorne would be complete which failed to lay stress upon his marriage to this lady, who, as their son Julian has written, 'was a blessing and an illumination wherever she went; and no one ever knew her without receiving from her far more than could be given in return.'

Removing to Concord, Massachusetts, he issued *Biographical Stories* (1842) for children, brought out an enlarged two-volume edition of the *Twice-told Tales* (1842), and lived for four years in the old colonial manse, previously occupied by the ancestors of Ralph Waldo Emerson, and by Emerson himself, overlooking the field of the first battle of the Revolution. Here he dwelt happily, preserving his old custom of comparative isolation, and, seeing but little of his famous neighbours Emerson and Thoreau. He wrote many sketches and studies for the *Democratic Review*. These formed the *Mosses from an Old Manse* (1846). But he was poorly paid, or not at all. The *Review* failed; and, as he had lost all his previous savings invested at Brook Farm, he was forced to leave this home, and accept a place in the custom-house again—this time as surveyor, in his native town, Salem. The place was uncongenial, and for nearly four years

he remained silent as an author. But by the expiration of his term he had completed (February 1850) *The Scarlet Letter*, which at once gained great renown, and still remains perhaps the best known of his works. It did not, however, bring him pecuniary ease. Hiring a small house at Lenox, Massachusetts, he entered upon a phase of remarkable productivity, showing that he had needed only encouragement and recognition to bring his powers into full play. At Lenox he wrote *The House of the Seven Gables* (1851), which added to his celebrity and popularity; also *The Wonder Book*, a recast of classic legends for children (1851); and prepared *The Snow Image*, which was not published until 1852. In the winter he wrote at West Newton *The Blithedale Romance*, which incidentally drew colouring from the Brook Farm episode, though in no way attempting to depict it as a fact. Having bought at Concord a small house, which he christened 'The Wayside,' he settled there in the summer of 1852, and wrote a Life of General Franklin Pierce, his old college friend, who had been nominated for the presidency of the United States. Immediately afterwards he completed *Tanglewood Tales*, a continuation of *The Wonder Book*; but this appeared first in 1853.

Pierce, on his inauguration as president in March 1853, named Hawthorne to be consul at Liverpool, a lucrative office which his experience in the custom-house qualified him to fill. The appointment was confirmed by the senate; and although Hawthorne had resolved to accept nothing from the president, and much persuasion had to be used to change his mind, he finally took the appointment, and sailed for Liverpool, midsummer, 1853. He held the consulate until near the close of 1857, attending closely to his duties, but spending part of the time in London, and visiting various portions of England and Scotland. A sojourn of a year and a half in Rome and Florence, beginning January 1858, supplied him with the materials for a new romance, *The Marble Faun*, better known in England as *Transformation*, which he wrote at Redcar, Yorkshire, in the autumn of 1859, and published in 1860. In June of this year he returned to Concord, where approaching ill-health, and the mental depression caused by the outbreak of civil war in the United States, impeded his efforts at literary composition. He wrote, however, a number of brilliant papers embodying observations and experiences in England, which were printed in the *Atlantic Monthly*, and then issued in the volume *Our Old Home* (1863). He also began a new romance, founded on the idea of an elixir of immortality. It remained unfinished at his death, which occurred in the night of May 18, 1864, at Plymouth, New Hampshire, whither he had gone on a journey in search of health, with his friend ex-president Pierce. He was buried at Concord, Massachusetts, May 24, in a spot near which are the graves of Emerson and Thoreau.

In his style he early developed that maturity of dignified composure, free from constraint or affectation, and that lucid expression, which are among its most characteristic traits. With little faculty for the harmonies of verse, he had a singular command over the musical qualities of prose, enabling him to produce periods remarkable for their sonorous richness and delicate cadences, that sometimes raise them almost to the plane of poetry, yet never destroy their character as prose by interjecting the actual rhythms of verse. Although exceptionally fitted for conveying subtleties of thought and fantasy, his style is equally adapted to the comprehension of children, being invariably clear, and strongly marked by common sense. Another noticeable peculiarity is that, in the entire range of his writings, quotation is almost never resorted to;

the author's mind being apparently so self-centred that its originality felt no need of aid or illustration from other writers. The superlative merits of Hawthorne's style were but slowly recognised in his own country; but his fame has rapidly and steadily increased since his death. Several of his works have been translated into foreign languages; and he is now generally esteemed as one of the greatest imaginative minds of the century, holding a place in the first rank among masters of modern English prose.

The personal appearance of Hawthorne was tall, vigorous, and commanding. Powerful physically, and in every way a strong specimen of manhood, he yet in his manner and presence showed the gentleness of a woman. His intimates were few, but with them he was a genial comrade, as he was also a delightful companion in his household. The union in him of strength and sensitiveness has been well described by James Russell Lowell:

First, he from sympathy still held apart
By shrinking, over-eagerness of heart—
New England's poet, soul reserved and deep,
November nature with a name of May.

The best extant portraits of Hawthorne are the photographs taken by Mayall of London in May 1860. One of these was engraved in *Harpers' Magazine* for July 1886; another in the *Century Magazine* for May 1887.

A preliminary version of the unfinished romance was edited by his eldest child Una (1844-77), with the aid of Robert Browning, and was published under the title of *Septimius Felton* (1872). Another version, edited by his son Julian, appeared as *Dr Grimsshaw's Secret* (1883). Both these forms had been abandoned by the author, who left in MS. portions of the work as he meant to complete it, *The Dolliver Romance* (1876). His widow (who died in London, 26th February 1871) edited and published his *American Note-books* (1868), *English Note-books* (1870), and *French and Italian Note-books* (1871); besides bringing out a volume of her own *Notes in England and Italy* (1868). George Parsons Lathrop (1851-98), who married in 1871 Hawthorne's second daughter and youngest child, born in 1851, published *A Study of Hawthorne* (1876), containing many biographical details, and edited the Riverside edition of the complete works (1883). Rose Hawthorne Lathrop has also made numerous contributions to periodicals in prose and verse, and published in 1888 a volume of poems entitled *Along the Shore*, and in 1897 *Memories of Hawthorne*. She became superioress of a Dominican community. Julian Hawthorne issued a complete memoir of his father, *Nathaniel Hawthorne and his Wife* (2 vols. 1883). There are shorter works on Hawthorne by Henry James (1879), J. R. Lowell (1890), Moncure Conway (1890), Annie Fields (1900), and H. A. Beers (1920). See also Julian's *Nathaniel Hawthorne and his Circle* (1904).

JULIAN HAWTHORNE, his son, was born at Boston, Massachusetts, June 22, 1846. After his studies at Harvard he devoted himself to engineering at Dresden; next worked under General McClellan in the New York Docks, returning to Dresden to pursue a life of letters, continued later in London (1875-82) and in New York. He subsequently settled on a Jamaica farm. His first novels, *Bressant* (1873) and *Idolatry* (1874), were followed by *Garth* (1875), *Sebastian Strome* (1880), *Fortune's Fool* (1883), and *Dust* (1884); and by a series of shorter stories, some of the detective class, such as *David Poindeexter's Disappearance* (1888) and *Section 558*; or *The Fatal Letter* (1888).

Hawtrej, EDWARD CRAVEN (1789-1862), born at Burnham, Maidenhead, in 1814 became under-master, in 1834 head-master, and in 1852 provost of Eton. See the Life of 'the ugliest man in England, but the most agreeable,' by St John Thackeray (1896), and How's *Six Great Schoolmasters* (1904).

Hay is in England and Ireland largely obtained by the annual culture of old grass land for Fodder (q.v.); but in Scotland the crop consists mainly

of clover and sown grasses in which ryegrass bulks largely. This requires less turning and labour than the closer succulent natural grasses, and with twice turning, and a week or ten days' drying, will generally be fit for the rick, into which the English farmer at once places it. In Scotland the weather is seldom sufficiently fine to fit the hay, within a moderate time, for a large rick, and the practice here, as in the moister parts of England and in Ireland, is to put it, after a few days, into *cocks*, containing one or two hundredweight, and thence, after another week, into what are technically called tramp-ricks, containing from one to two tons. From these it is transferred at any convenient time to the rick-yard. This practice, although very prevalent in the north, is attended with loss of time and labour, and, moreover, bleaches and dries up the hay, giving it the appearance of straw, and preventing that gentle heating which English farmers desire both in their clover and grass hay. In the United States timothy, reedtop, orchard-grass, blue-grass or June-grass, red clover, and alfalfa (*lucerne*) are the best hay plants.

The management of the natural grasses of which most English hay consists is somewhat different, and the process is seen in perfection in Middlesex and various of the counties about London. The great matter—too generally overlooked in Scotland—is to preserve the colour and flavour of the grass. This may be done by frequent turning, so as to have it rapidly dried, and if possible without the deteriorating washing of repeated rains. Artificial drying best attains this end, but is of course impracticable on the large scale. In the best style of English haymaking the grass, after being cut with the scythe or machine, and as soon as the dew is off, is shaken and spread out by means of forks or of a *redding-machine* drawn by a horse. It is not allowed to lie long exposed to the sun, but before evening is drawn together by rakes into *wind-rows*, which, if there is any prospect of rain, are made up into small heaps or *cocks*. It is again spread out next morning, or on the return of favourable weather; and when the operations are expedited by wind and sun, the hay will be ready for the rick by the second or third day. There is, however, much difference in the time during which the hay requires to lie out; the bulk of the crop and the quality of the land must be especially considered. When the grasses are cut in bloom, as they should be, and before their seed ripens and their stems get tough and hard, they contain the largest amount of moisture, and require careful making, but produce then the most nutritive and palatable hay. As soon as it is thoroughly dry it should be put at once into the stack or rick, and well trodden down. A certain amount of heating improves the flavour, and renders the hay more palatable to every kind of stock. When, as is sometimes the case, it is imperfectly made, or picked up too soon, it gets overheated, and becomes dark brown or black, while its nutritive properties are diminished; it is, moreover, apt to disagree with both horses and cattle, and can be profitably used only when mixed with straw and cut into chaff. Indeed it has been proved by experiments that hay may be so damaged by bad weather in the process of making as to be unable to maintain, not to speak of increasing, the condition of animals fed upon it. Hay put together when damp from rain or dew does not heat, as it does when it contains an undue amount of natural moisture, but speedily moulds. When hay has been weathered and injured by repeated rains, it may be rendered more palatable by scattering a little common salt or specially prepared spice over the rick whilst it is being built. In Scotland, eight or ten pounds of salt to the ton is used alike

for the clover and grass hay. In mid and southern England the best hay is generally got up in June, in Scotland not until the middle of July. The crop averages from one to two tons per acre. Hay that has stood for seed is tougher and less nutritive than that cut earlier, for the sugar, gum, and gluten of the matured seed have been abstracted from the stems. See also *SILAGE*.

Hay, JOHN, an American author, was born at Salem, Indiana, 8th October 1838, graduated at Brown University in 1858, and was admitted to the Illinois bar in 1861. Almost immediately after he became assistant private secretary to President Lincoln; and during the war he served for some months in the field, retiring with the brevet of colonel. He was afterwards first secretary of legation at Paris and Madrid, and *chargé d'affaires* at Vienna; and in 1870-75 he was on the staff of the *New York Tribune*. In 1879-81 he was first assistant-secretary of state. His *Pike County Ballads* (1871) include 'Little Breeches' and 'Jim Bludso'; he also published *Castilian Days*, and, with J. G. Nicolay, a *Life of Lincoln* (1891). In 1897-98 he was ambassador to Britain, from 1898 secretary of state. He died 1st July 1905. See his *Life and Letters* by Thayer (1915).

Hayden, FERDINAND VANDEVEER, geologist, was born at Westfield, Massachusetts, 7th September 1829, studied at the Albany medical college, and during the greater part of 1853-62 was employed in surveys in the north-west. He served as surgeon in the Union army during the war, and filled the chair of Mineralogy and Geology in the University of Pennsylvania from 1865 to 1872. In 1867-69 he carried out the geological survey of Nebraska, and afterwards was director of the geological survey of the territories of the United States, until in 1879 the various national surveys were combined in the geological survey of the United States. Till 1886 Dr Hayden remained at the head of the Montana division. He died 18th January 1888. He published many papers, besides numerous and valuable government reports.

Haydn, JOSEPH, a German composer, was born at the village of Rohrau, on the confines of Hungary and Austria, 31st March 1732. He was the son of a poor wheelwright; and manifesting great musical talent, he was received at the age of eight into the choir of the cathedral of St Stephen's, at Vienna. Here he remained till his eighteenth year, acquiring a practical rather than a theoretical knowledge of his art, by singing the music of the best Italian and German religious composers. In that year, however, his voice broke, and he lost his place as a chorister. He wandered about the streets of Vienna, and earned a precarious livelihood by playing the violin in serenading parties and at dances. A charitable singer offered him a lodging, which for a short while he availed himself of. Ultimately, by the exercise of great thrift, he was enabled to hire an attic and a piano; then he devoted all his leisure time to study. He bought by accident the six sonatas of C. P. E. Bach at a cheap bookstall, and the indefatigable study of them revealed to him the possibility of new form in music—form which should be the reaction against the old contrapuntal style of J. S. Bach and Handel, and which it became thenceforward his mission to inaugurate. The main essentials of this reaction were the abandonment of the fugue form as the basis of musical composition, and the substitution in its room of two free melodies as themes for treatment, not necessarily constructed in double counterpoint to one another. During this period of assiduous study Haydn still kept up his connection with the serenaders and dance-players of Vienna, for whom he often now wrote

the music. One evening as he was playing a serenade of his composition, along with other instrumentalists, under the window of Frau Kurz, the wife of the theatrical manager of that name, her husband was very much struck by the music, and calling Haydn up, commissioned him to write an opera as melodious as the serenade. This was the beginning of his fortunes. His opera made him acquainted with the poet Metastasio, at that time a tutor in Vienna, by whom he was introduced to the composer Porpora, and enabled to remedy the deficiencies of an education principally obtained hitherto through private study.

In the later part of 1750 he composed his first quartet for stringed instruments. In 1759 Count Morzin engaged him as capellmeister. For Count Morzin's orchestra Haydn wrote his First Symphony in D. The once obscure musician was now a popular music-master in Vienna. He married at this time Maria Anna Keller, the daughter of a wig-maker, who had been kind to him in his days of penury. This union did not prove a happy one. The circumstances of it were singular; he had designed to marry the younger sister, but she had determined to retire into a convent, and Haydn was persuaded by the father to take the elder one instead, for whom he had always entertained an objection. 'It is nothing to her,' said Haydn near the close of his life, 'whether her husband be a cobbler or an artist.' Her sole ambition was to squander Haydn's earnings. In 1760 Prince Esterhazy offered him the post of vice-capellmeister. His duties in this new situation were to conduct two operas a week, for which he sometimes had to compose the music, to conduct and compose for an orchestral concert every afternoon, to have a fresh composition for the prince's 'reception' every morning, besides supplying the music for incidental water-parties, dances, &c. Many of Haydn's most beautiful symphonies were written here, and the greater number of his magnificent quartets. The excessive demands on his invention do not seem to have impaired its fertility in the slightest. After the death of Prince Esterhazy in 1790 Haydn accompanied Salomon the violinist to England, where, in 1791-92, he produced six of his *Twelve Grand Symphonies*. His reception was brilliant in the highest degree. On his return to Vienna he had Beethoven for a pupil. In 1794 he made a second engagement with Salomon for England, and during this period brought out the remaining six symphonies. In England he first obtained that recognition which afterwards fell to his share in his own country. On his return to Austria he purchased a small house with a garden in one of the suburbs of Vienna. Here he composed his oratorios the *Creation* and the *Seasons*. The former work, the harmonies of which are pervaded with the fire of youth, was written in his sixty-fifth year; the *Seasons* (completed in eleven months) was almost his last work. He died at Vienna, 31st May 1809.

In person Haydn was below the middle stature. His features were regular, and the general cast of his countenance a stern one. He had the peculiarity of never laughing aloud. He was very neat and methodical in his habits—composing a certain number of hours daily, and wearing full court dress when so engaged. His musical style is marked by the predominance of melody—melody in its tenderness, melody in its power, melody incessant. His works have therefore more spontaneity and charm than the elder school of Bach and Handel, but less massiveness, sublimity, and majesty. He clearly realised and pursued his aim, laying down the principle that 'melody is the charm of music, and the invention of a fine air is a work of genius.' He is the father of the symphony, and conducted more than any other man to that separation of

instrumental music from vocal, unknown or little practised before his day, which has given an independent life to instrumental music up to the present time.

Haydn's works are exceedingly numerous, comprising 125 symphonies, 83 quartets, 38 trios, 14 operas, 8 oratorios, 175 pieces for the baritone, 24 concertos for different instruments, 14 masses, 1 Stabat Mater, 10 smaller church pieces, 44 sonatas for the pianoforte, with and without accompaniments; 12 German and Italian songs, 39 canzonets, 13 hymns in three and four parts, the harmony and accompaniment to 364 old Scottish songs, besides a prodigious number of diversissements and pieces for various instruments.

Compare Carpani's *Le Haydine* (2d ed. Padua, 1823); Haydn's autobiographical sketch, first published in the *Wiener Zeitschrift für Kunst* (1836); Karajan's *Joseph Haydn in London* (Vienna, 1861); Pohl, *Joseph Haydn* (1875-87, completed by E. V. Mandyczewski); Miss Townsend's *Life of Haydn* (Lond. 1884); Cuthbert Hadden's *Haydn* (1903); A. Schnerich, *Josef Haydn und seine Sendung* (1922).

Haydon, BENJAMIN ROBERT, historical painter, was born at Plymouth on 26th January 1786. He attended the grammar-school of Plympton, where Sir Joshua Reynolds had been educated; and his father, a bookseller, being desirous that his son should follow his own trade, placed him in his shop. But, in spite of delicate eyesight, the boy was resolved to become a painter, and in May 1804 he was admitted a student of the Royal Academy, where he was befriended and influenced by Fuseli, the keeper. Three years later he exhibited his first picture, 'Joseph and Mary resting on the Road to Egypt,' and after studying assiduously for three months the Elgin Marbles, whose purchase by the nation he afterwards enthusiastically advocated, he produced his 'Dentatus,' a commission from Lord Mulgrave. The work was coldly received by the Academy in 1809, and hung in the anteroom; and this treatment was the beginning of the painter's rupture with that body, which embittered his life and damaged his prospects. In the following year he began a large subject from *Macbeth*, which had been commissioned by Sir George Beaumont, but was afterwards declined. He was more successful with his 'Judgment of Solomon,' probably his finest production, now in the collection of Lord Ashburton, which he sold for 700 guineas. It gained a prize of 100 guineas from the Royal Institution, which had awarded a like sum for the 'Dentatus.' Having visited the Continent with Wilkie in 1814, and studied the old masters in the Louvre, Haydon began his 'Christ's Entry into Jerusalem,' which was completed in 1820, and realised £1700 by exhibition in the Egyptian Hall, London. It is now in the art-gallery of Philadelphia. Another immense religious subject, 'The Raising of Lazarus,' was completed in 1823, in the midst of great difficulties. The artist had been arrested for debt during its progress, and during the rest of his life he was never able to free himself from financial embarrassments, though it was proved that during six years, from 1831 to 1836, he had earned £4617 by his art. His 'Mock Election,' purchased by George IV. for 500 guineas, was founded upon a scene witnessed by the painter while a prisoner in King's Bench. He resorted to every kind of expedient to meet the needs of the moment. Greatly against his will he took to portrait-painting; a public subscription was raised on his behalf; he raffled his 'Eucles' and 'Xenophon's First Sight of the Sea;' he delivered a popular series of lectures on painting and design in 1836, published in two volumes in 1844. In 1832 Lord Gray commissioned the well-known picture of 'The Reform Banquet,' and in

1834 the Duke of Sutherland gave 400 guineas for a 'Cassandra.' Haydon had never wearied of urging upon government and persons of influence the necessity for the national encouragement of art, and it was a bitter disappointment when he failed to obtain employment by the commissioners for the decoration of the Houses of Parliament. He was further crushed by the entire want of success which attended his exhibition of two completed pictures from the designs which he had prepared for the cartoon competition; his mind gave way, and on 25th June 1846 he shot himself in his studio before his unfinished painting of 'Alfred's First Parliament.' The works of Haydon are elevated in aim and subject, and G. F. Watts pronounced that 'his expression of anatomy and general perception of form are the best by far that can be found in the English school, and I feel even a direction towards something that is only to be found in Phidias.' His works, however, are very unequal in their several parts; his execution was seldom equal throughout to his conception; and most of his productions bear only too evident traces of the haste and the untoward circumstances amid which they were executed.

See the *Life of Haydon*, from his *Autobiography and Journals*, edited by Tom Taylor (3 vols 1853); his *Correspondence and Table Talk*, with Memoir by his son (1876); *B. R. Haydon and his Friends*, by George Paston (1905).

Haye, LA. See HAGUE.

Hayes, AUGUSTUS ALLEN, chemist, was born at Windsor, Vermont, in 1806, studied chemistry under Professor Dana, and settled in Boston in 1828. He discovered the organic alkaloid sanguinaria, carried through experiments which led to the construction in 1838 of improved furnaces and boilers, suggested the process of reducing pig to malleable iron without loss by the use of the oxides of iron, as well as new processes in copper-smelting, the decomposition of alcohol, and the formation of chloroform, and made important investigations into the properties of guano. He also examined the constitution of sea-water and fresh water at various depths, prepared a report for the navy department on the copper-sheathing of vessels, and supplied a novel process for the manufacture of saltpetre. Hayes was for many years state assayer of Massachusetts, and died in Brookline there, 21st June 1882.

Hayes, ISAAC ISRAEL, Arctic explorer, was born in Chester county, Pennsylvania, 5th March 1832, graduated in medicine at the University of Pennsylvania in 1853, and sailed as surgeon in the Kane expedition in search of Franklin. The story of his attempt to reach Upernivik in 1854 is told in *An Arctic Boat-journey* (1860). In 1860-61 he conducted a second expedition to the Arctic regions; and in 1869 he again visited Greenland. His third voyage is described in *The Land of Desolation* (1871). He was surgeon of volunteers from 1862 to 1865, retiring with the brevet rank of lieutenant-colonel; and he served in the New York assembly for five years. His Arctic work was recognised by medals from the London and Paris geographical societies. He died 17th December 1881.

Hayes, RUTHERFORD BIRCHARD, nineteenth president of the United States, was born at Delaware, Ohio, 4th October 1822. He graduated at Kenyon College, Ohio, in 1842; and, having studied law at Harvard, he practised as a lawyer at Cincinnati, 1849-61. In the civil war Hayes served with distinction as an officer of volunteers, being once severely wounded, and ultimately attained the rank of brevet major-general. He was returned to congress from Ohio in 1865 and 1866,

chosen governor of his state in 1867, and re-elected in 1869 and again in 1875. In 1876 he was selected as the Republican candidate for the presidency of the United States, the Democratic candidate being Samuel J. Tilden (q.v.). The election which followed was notable for the exciting complications and the period of tension and suspicion that ensued. In Louisiana two electoral boards were commissioned by rival claimants to the governorship, and in some of the other states questions arose touching the legality of the return of the Republican presidential electors. Finally, an electoral commission was created by act of congress, consisting of five judges of the supreme court, five senators, and five representatives. This body, made up of eight Republicans and seven Democrats, gave the disputed votes to Hayes, by a majority of eight to seven. The electoral vote was thus returned at 185 for Hayes against 184 for Tilden; the popular vote, as counted, stood 4,284,265 for Tilden and 4,033,295 for Hayes. This decision was generally acquiesced in, although the conviction of the Democratic party that their candidate had been unjustly deprived of office remained unshaken; and as late as 1878 the Democratic majority of a congressional committee of investigation issued a report declaring the action of the returning boards in Louisiana and Florida to have been fraudulent. Under the Hayes administration the country recovered much of its commercial prosperity, which had suffered severely in the financial crash of 1873. Two features in Hayes's policy were reform of the civil service (in pursuance of which he removed from the collectorship of customs at New York Chester Alan Arthur, q.v.) and the conciliation of the southern states. He was also active in pressing forward the resumption of specie payments; but the bill for the monetisation of silver was carried against his veto. He died at Fremont, Ohio, 16th January 1893. See *Life* by Stoddard (1889).

Hayesine, also called BORATE OF LIME and ULEXITE, is a double salt of sodium and calcium, and a source of Boiacic Acid (q.v.).

Hay-fever, also called HAY-ASTHMA and SUMMER-CATARRH, a disease mostly met with in early summer or autumn, has the symptoms of catarrh—viz. redness and swelling of the nasal mucous membrane, with a copious watery discharge and repeated paroxysms of sneezing, irritation of the eyes, and intense headache. There are also present general malaise, loss of appetite, and more or less feverishness; and difficulty of breathing is added when the bronchial mucous membrane is affected. Hay-fever is most commonly a disease of adult life, but it may occur at all ages. It usually returns annually when the patient is subjected to the exciting cause, which is oftenest in the form of floating pollen of different grasses, although other things such as dust or bright sunlight may set up an attack. Three factors essential to the production of hay-fever are a peculiar constitution or anaphylaxis, a local irritability, and an external exciting cause. The treatment to be successful must be directed to these: (1) improve the health by tonics, and soothe the nervous state by bromide of potassium or antipyrin; (2) apply locally antitoxin or adrenalin and cocaine, or use the thermo-cautery on the nasal mucous membrane; (3) remove the patient from the cause by sending him to the seaside or for a voyage at the time of the year when the pollen, &c. to which he is susceptible, is in the air.

Hayley, WILLIAM, Cowper's biographer, was born at Chichester, 9th November 1745, but abandoned legal studies for a life of lettered leisure, living in London, at Earham in Sussex, and lastly

at Feltham, where he died 20th November 1820. Among his works are didactic *Essays* in verse on painting, on history, on epic poetry, *The Triumphs of Temper: a Poem*, some plays, a *Life of Milton*, a *Life of Romney*, and his most memorable monument, *The Life of Cowper* (1803; see COWPER). *Memoirs* of and by himself were published in 1823.

Haym, RUDOLF, philosopher and writer, was born at Grünberg in Silesia on 5th October 1821. In 1848 he sat in the national assembly at Frankfurt; but from 1851 he lectured on philosophy and German literature at Halle, becoming professor in 1868. He wrote lives of W. von Humboldt (1856), Hegel, Schopenhauer, Herder, and Max Duncker (1890), *Die romantische Schule* (2d ed. 1906), and in 1901, the year of his death, a volume of *Erinnerungen*. A memorial volume was issued in 1902.

Haynau, JULIUS JAKOB, BARON VON, an Austrian general, was born at Cassel, in Germany, 14th October 1786. Entering the Austrian service in 1801, he signalised himself during the Italian campaigns of 1848-49 by his ruthless severity, especially at the capture of Brescia, where his flogging of women and other atrocities gained him the name of the 'Hyæna of Brescia.' Haynau was engaged in the siege of Venice, when he was summoned by the emperor to Hungary, in May 1849, to take the supreme command of the forces in that country. The storming of Raab, his victory at Komorn, his occupation of Szegedin, and his victories on the Theiss contributed materially to the final success of the imperialists. But Haynau's atrocious severity towards the defeated Hungarians excited the detestation of Europe. Although appointed dictator of Hungary after its pacification, he was nevertheless dismissed in 1850 on account of the intractability of his character. In the same year, when visiting the brewery of Messrs Barclay & Perkins, in London, he was assaulted by the draymen, on account of his cruelty, and escaped with his life, but the loss of his moustache. Baron Schönhals, in a biography of his friend Haynau (Graz, 1853), tries to exonerate his character, and asserts that he only acted in obedience to the orders of his masters. Haynau died at Vienna, March 14, 1853.

Hayne, ROBERT YOUNG, an American statesman, born in South Carolina in 1791, was admitted to the bar in 1812, served in the war with Great Britain, and at its close returned to his practice in Charleston. He was a member of the state legislature in 1814-18, and became speaker, was attorney-general of the state in 1818-22, and sat in the United States senate from 1823 to 1832. He was a vigorous opponent of protection, and in 1832 boldly supported in congress the doctrine of Nullification (q.v.). Daniel Webster's reply ranks among his ablest speeches. In November 1832 South Carolina adopted an ordinance of nullification, in December Hayne was elected governor, and the state prepared to resist the federal power by force of arms. A compromise, however, was agreed to (see JACKSON), and the ordinance was repealed. Hayne died 24th September 1839.

Hay River, a feeder of Great Slave Lake in the Canadian North-west. In its course, north-east to the southern shore of the lake, it descends the two Alexandra Falls, about 250 feet high and 300 yards wide.

Hayti, or HAITI ('mountainous country,' otherwise HISPANIOLA, or SANTO DOMINGO), is, after Cuba, the largest of the West Indian Islands, now divided into the independent states of Hayti and the Dominican Republic (q.v.). For the map, see WEST INDIES. It is nearly equidistant from Porto Rico on the E., and from Cuba and Jamaica on the W., with the Caribbean Sea on the S.,

and with the Bahamas and the open ocean on the N. Hayti lies between 17° 37' and 20° N. lat., and between 68° 20' and 74° 28' W. long. It belongs to the group of the Greater Antilles, and, like all the principal members of its series, its greatest length (about 400 miles) is in the direction—from west to east—of the chain of which it forms a part; its greatest breadth is 160 miles. Area, including the islands of Tortuga, Gonaive, &c., about 28,820 sq. m., or nearly that of Scotland. The country is mountainous, being traversed longitudinally by northern, central, and southern ridges, terminating in headlands on either coast; but between these ranges are wide and fertile plains. There are no active volcanoes in the island, but earthquakes are frequent. The highest peak is Loma Tina (10,300 feet), and in the middle section of the Sierra del Cibao the average height is 7000 feet. The climate is hot and moist in the lowlands, the temperature at Port-au-Prince ranging from 67° to 104° F.; the mean range in the highlands is from 60° to 76° F. The heaviest rains are in May and June, and occasional hurricanes visit the island. Agriculture is very backward, although Hayti is one of the most fertile spots in the West Indies; while its excellent harbours, more especially those in the Gulf of Gonaive on the west, offer considerable facilities to foreign trade. The mountains are clothed with forests of pine and oak, and the island is rich in mahogany, satinwood, rosewood, and other valuable timbers. Cotton, rice, maize, cocoa, ginger, arrow-root, yams, tobacco, and numerous fruits are indigenous; and the mango, bread-fruit, sugar, coffee, and indigo are also produced. The minerals are now little worked, though some gold-washing is still carried on in the streams descending the northern slope of the Cibao. The rivers are inconsiderable, and useless for navigation. The largest lake, besides several bodies of fresh water, is the salt lake of Enriquillo, 25 miles inland from the south shore. Both rivers and lakes abound in caymans as well as fish. Birds are few, but reptiles and insects are numerous; the agouti is the largest wild mammal.

Hayti was discovered in 1492 by Columbus, who landed here on 6th December; and within little more than one generation the aborigines had been swept away by the remorseless cruelties of the Spaniards. Their place was filled with negro slaves, who were introduced as early as 1505. Next came the Buccaneers (q.v.), who settled in the island of Tortuga, and ultimately gained a footing on the mainland; and, as those marauders were chiefly French, the western portion of Hayti, which was their favourite haunt, was in 1697 ceded to France by the peace of Ryswick, thus presenting the first important break in the unity of Spanish America. For nearly a hundred years the intruders imported vast reinforcements of Africans; while the mulattoes, who were a natural incident of the concomitant license, rapidly grew, both socially and politically, into an intermediate caste, being at once uniformly excluded from citizenship and generally exempted from bondage. In 1791, under the influence of the French Revolution, the mutual antipathies of the three classes—white, black, and mixed—burst forth into what may well be characterised as the most vindictive struggle on record—a struggle which, before the close of the 18th century, led to the extermination of the once dominant Europeans, and the independence of the coloured insurgents. Thus, as the emancipated bondmen mostly belonged, at least in form, to the Church of Rome, Hayti now exhibited the only Christian community of negro blood on either side of the Atlantic. In 1801 France sent out a powerful armament to recover her revolted dependency, treacherously seizing and deporting the deliverer of his brethren, Toussaint l'Ouverture (q.v.). In

1803, however, she was constrained to relinquish her attempt; and in 1804 Dessalines, aping the example of Napoleon, proclaimed himself Emperor of Hayti, thus reviving the indigenous name of the island, which had been in disuse for upwards of three hundred years.

This great change was fatal to the commercial prosperity of French Hayti, decidedly the more valuable section of the island. In its progress it had destroyed capital in every shape; and in its issue it could not fail to paralyse labour under circumstances where continuous exertion of any kind was equally irksome and superfluous. Nor was the political experience of the lately servile population more satisfactory than its economical condition. Sometimes consolidated into one state, and sometimes divided into two, the country alternated, through the instrumentality of one revolution after another, between despotism and anarchy, between monarchy (more or less constitutional or imperial) and republicanism. Its only tranquil period of any duration coincided with the rule of President Boyer (q.v.), which subsisted from 1820 to 1843—its last twenty-one years comprising not merely the whole of French or Western Hayti, but likewise the Spanish or eastern portion of the island, whose inhabitants in 1843 formed themselves into the Dominican Republic (q.v.). Hayti, thus united, was in 1825 recognised even by France, on condition of paying 150 million francs, or £6,000,000, as a compensation to the former planters—a sum reduced in 1838 to sixty millions. The western portion of the island remained republican in its form of government until 1849, when its former president, the negro General Soulouque, proclaimed an empire, and assumed the title of Emperor Faustin I. In 1859, however, a republic was again proclaimed and a new constitution adopted, which was modified in 1867. Few presidents have since been permitted to complete their term of office (seven years). In 1889 General Hippolyte drove out General Légitime. He died in 1896, and his successor, General Sam, ruled till 1902, when civil war placed M. Firmin, and later in the year General Nord, at the head of the state. Revolutions in 1908 and 1911 began and ended General Simon's administration. In 1915 the United States intervened to put a stop to the general turmoil and political disintegration which was rapidly approaching. A treaty of 1916 made Hayti almost a protectorate of the United States. The present constitution was ratified in 1918. Fraud and dishonesty have been eliminated from national business; the making of roads has made great strides, and progress has been made in sanitation.

It is doubtful whether in the hundred years of their independence the negroes have progressed or retrogressed. The people are nominally Christians, but society is permeated with the superstitious rites of *voodooism*.

The area of the western portion of the island, the negro republic of Hayti, is about 10,200 sq. m. There has never been any trustworthy census, but the population is estimated at 2,000,000. The capital, Port-au-Prince, with about 125,000 inhabitants, has an excellent harbour. Under the president are a senate and chamber of deputies, and five heads of departments. The returns of income and expenditure are merely estimates, and the disorders of civil war have in recent years rendered these more than usually valueless. There is a large floating debt, chiefly resulting from the issue of paper money by successive governments. There is an armed constabulary, officered by Americans. There is no navy. The dialect of the people is a debased French. The exports of Hayti include cacao, coffee, logwood, cotton, sugar, and lignum-vitæ. Of the imports the greater part comes from

the United States, and is composed of cheap manufactured and piece goods.

See St John, *Hayti, or the Black Republic* (1884; 2d ed. 1889); works by Maidou (1847), Aidouin (Paris, 1853-61); Janvier (Paris, 1883-85-86), Nau (Paris, 1886), Fortunat (1888), Rouzier (1892), Marcelin (1893), Justin (1894), Tippenhauer (1893), Léger (1907), and Hesketh Pritchard, *Where Black rules White* (1900).

Hayward, ABRAHAM, essayist and talker, was born at Wishford, in Wiltshire, 31st October 1802. He had neither public school nor university education, but after keeping terms at the Inner Temple was called to the bar in 1832. His leanings were, however, more to letters than to law, yet he founded and edited the *Law Magazine*, and to every one's surprise was made Q.C. by Lord Lyndhurst in 1845. He published in 1833 his excellent prose translation of the first part of *Faust*, and soon became a busy contributor to the newspapers and magazines, especially the *Quarterly Review*, in which readers soon learned to recognise his personality in an unusual combination of vivacity, epigrammatic verve, and critical acumen. By his brilliant conversation, his wealth of anecdotes, his whist-playing, and his artistic interest in 'the art of dining' he delighted society almost down to his death, at London, February 2, 1884. Many of his best articles were reprinted in his *Biographical and Critical Essays* (2 vols. 1858), the second series (2 vols. 1873), and the third (1 vol. 1873); and in *Sketches of Eminent Statesmen and Writers* (2 vols. 1880). Other books were *Autobiography and Remains of Mrs Piozzi* (2 vols. 1861), *Selections from the Diary of a Lady of Quality*—Sir Watkin Wynne's daughter (1864), and a somewhat perfunctory book on *Goethe*, in 'Foreign Classics for English Readers' (1877). His little books—*The Art of Dining* (1852), *Lord Chesterfield and George Selwyn* (both in 1856), and *Short Rules of Modern Whist* (1878)—were widely circulated. In 1878 he published in two volumes his *Selected Essays*. His *Select Correspondence* was given to the world in two volumes in 1886.

Hazard, a game with two dice. The *caster* calls 5, 6, 7, 8, or 9 for the *main*. He then throws. If he throws the number called, or if he throws 12 when 6 or 8 is the main, or 11 when 7 is the main, he *nicks*, and wins of his opponent (named the *setter*). If he throws 2, 3, 11, or 12 when 5 or 9 is the main, or 2, 3, or 11 when 6 or 8 is the main, or 2, 3, or 12 when 7 is the main, he loses. If he throws any other number—thus, when 7 is the main, if he throws 4, 5, 6, 8, 9, or 10—it is called his *chance*. He then continues to throw until either the main or the chance is thrown. If the main is first thrown, the setter wins; if the chance is first thrown, the *caster* wins.

Hazaribagh, chief town of the district of the same name in Chota Nagpore, in the province of Bihar and Orissa. It is really a cluster of hamlets, which sprung up round the former military bazaar, with tiled fields between. There is an external college of Patna University. Pop. 17,000.—*Hazaribagh district* has an area of 7021 sq. m., and a population of a million and a quarter.

Hazebrouck, a town in the French department of Nord, 28 miles WNW. of Lille by rail. The parish church (1493-1520) is surmounted by a spire of open work, 260 feet high. There are some linen and tobacco manufactures. Pop. 9000.

Hazel (*Corylus*), a genus of trees of the natural order Betulaceæ, of which the fruit is a nut in a leafy and lacinated cup, the enlarged involucre of the female flower. The male flowers are in cylindrical catkins; the female flowers appear as mere clusters of coloured styles at the extremities of buds.—The Common Hazel (*C. Avellana*) is a low tree, a native of Britain, and of all the temperate

parts of Europe and Asia; it is common also in North America. There are ten or twelve improved varieties cultivated extensively in Kent, especially around Maidstone and in some other parts of England. Of these there are two types—one with round nuts, named *cobs*; the other with elongated nuts, named *filberts*. The cup or involucre of the former is shorter, more open, and not so much lacinated as that of the latter. Of either type there is a variety in which the pellicle enclosing the kernel

Common Hazel (*Corylus Avellana*):
a, male and b, female flowers; c, fruit.

is deep red; and both of these are highly esteemed. These particular varieties are propagated by suckers which are more or less freely produced, by layers, and by budding and grafting. The tree is extensively grown in some parts of England for coppice-wood, being reared for this purpose from seed. The young straight stems and branches are employed for making crates, baskets, hurdles, hoops, stakes, &c.; and the larger wood for charcoal, which is in great request for forges, for the manufacture of gunpowder and artists' crayons. Chips of the wood are in Italy sometimes put in turbid wine for the purpose of fining it; and the roots are used by cabinet-makers for veneering. Magical properties have been ascribed to hazel-rods by the credulous, as it was of them the *Divining-rod* (q.v.) was formed for the purpose of discovering water, minerals, or buried treasure. From the wood an empyreumatic oil is extracted, which is a vermifuge, and alleged to be a cure for toothache. Hazel-nuts yield, on pressure, about half their weight of a bland fixed oil, often called *nut-oil* in Britain, the hazel-nut being popularly known by the term *nut* alone; but in Germany it is walnut-oil which is usually called nut-oil. Hazel-nut oil has drying properties, and is much used by painters; it is also used by perfumers as a basis with which to mix expensive fragrant oils; and it has been employed medicinally in coughs.

The larva of a weevil (*Balaninus nucum*) feeds on the kernels of hazel-nuts. The parent female makes a hole into the nut by means of her long snout, and there deposits an egg. Great numbers of nuts are thus destroyed.

The Beaked Hazel (*C. rostrata*), a species having a very hairy fruit-cup prolonged into a long beak, is a native of the northern parts of America. Its kernel is sweet.—The Constantinople Hazel (*C. coburnia*), the nuts of which are considerably larger than those of the common hazel, is a native of the Levant, from which the fruit is imported into Britain. It is much used for expressing oil, but is a less pleasant fruit than many kinds of cob-nut

and filbert. A Himalayan species of hazel (*C. ferox*) has a spiny fruit-cup, and an excessively hard nut.—*Barcelona nuts* are the nuts of a variety of the common hazel, kiln-dried before their exportation from Spain. Hazel-nuts not subjected to this process cannot be kept long without losing in part their agreeable flavour, and contracting a sensible rancidity, except in air-tight vessels, in which they are said to remain fresh even for years.

Hazelhen. See GROUSE.

Hazleton, a borough of Pennsylvania, 80 miles NNW. of Philadelphia, has ironworks, brush, coffin, silk, and knitting factories, but is of importance mainly as the chief business centre of the rich Lehigh anthracite coalfield; pop. (1920) 32,277.

Hazlitt, WILLIAM, was born at Maidstone on April 10, 1778. His father was a Unitarian clergyman who belonged to the county of Antrim. In his fifteenth year he began to study in the Unitarian College at Hackney, with the view of becoming a dissenting minister, a design which he early abandoned. In 1798 he formed the acquaintance of Coleridge, who encouraged him to compose his *Essay on the Principles of Human Action* ('the only thing,' he said, 'which I ever piqued myself upon writing'), which was not published, however, until 1805. For some time he endeavoured to earn a living as a portrait-painter; and, according to Northcote, would have become a great artist had he not forsaken his easel for his desk. In 1806 he published his *Free Thoughts on Public Affairs*, and in 1807 his *Reply to the Essay on Population by the Rev. T. R. Malthus*. After his marriage with Miss Stoddart in 1808 he lived at the village of Winterslow, in Wiltshire, until 1812, when he removed to York Street, Westminster, and found employment as a writer on the *Morning Chronicle* and *Examiner*. From 1814 to 1830 he contributed to the *Edinburgh Review*. His *Round Table: a Collection of Essays on Literature, Men, and Manners*, and the most popular of his works, his *Characters of Shakespeare's Plays*, appeared in 1817. Between 1818 and 1821 he delivered lectures at the Surrey Institute, which were afterwards published under the titles *Lectures on the English Poets*, on the *English Comic Writers*, and on the *Dramatic Literature of the Age of Elizabeth*. His marriage proved an unhappy one, and, after living for some time apart, Hazlitt and his wife were divorced in 1822. He was fond of retiring to Winterslow Hut, a coaching-house on the high-road from London to Salisbury. At this lonely inn, which stands amid bleak wolds on the verge of Salisbury Plain, he wrote most of the essays which he contributed to the *London Magazine*, and which were afterwards republished in his *Table Talk* (1821) and *Plain Speaker* (1826). An unfortunate passion for the daughter of a tailor with whom he lodged found expression in the *Liber Amoris*, or the *New Pygmalion* (1823), a book of a strong though painful interest. In 1824 he married a lady of some means, who travelled with him to Italy, but left him, for causes which can only be conjectured, during the return journey, and never joined him again. His *Selections from the English Poets* and *Sketches of the Principal Picture Galleries in England* appeared in 1824; his *Spirit of the Age, or Contemporary Portraits*, which some critics consider the ripest in thought and most felicitous in style of all his works, in 1825; and his *Life of Napoleon Bonaparte* in 1828-30. His last years were darkened by ill-health and money difficulties. He died on September 18, 1830.

Wayward and irascible, a prey to melancholy, and too often the victim of a rash and haughty self-confidence, Hazlitt was at bottom generous, ardent, and sincere. But his defects were sharpened by unsucess, and above all by the scurrilous malignity

with which his character and his writings were traduced by hired libellers of adverse politics. The scope of his powers was never recognised by his contemporaries, though, as Thackeray has said, there were probably not in all England twelve men with powers so varied. His genius had many facets. He excelled in description and in narrative, in reflection and in critical analysis. He wrote of nature and of art and the characters of men; as a critic of the drama he has never been equalled. He was one of the deadliest controversialists, a master of epigram and burning invective and withering irony. His letter to William Gifford stands unsurpassed as an example of polished vituperation. His judgment was at times clouded by prejudice and distorted by his love of paradox. But of all the Georgian critics he was the most eloquent, the most catholic, the most thoroughly equipped. He never wrote in cold blood; he welcomed excellence everywhere. He did justice alike to the Lakers and to the Queen Anne men. He was not less discriminating than enthusiastic. His style ranges from lively gossip to glowing rhapsody; at its best it touches one of the high-water marks of English, it is at once so vigorous and so graceful, so lucid and so rich, so exquisitely apt are the epithets, so firmly built are the sentences, so noble is the rhythm of the periods. His autobiographic essays are perhaps of all his works the most delightful—stamped with the seal of truth, tremulous with pathos, and bathed in the light of poetic imagination. His writings have never gained the recognition they merit; yet, with all his defects, it would be hard to point to Hazlitt's master in all the ranks of English critics.

See G. Saintsbury's article in *Macmillan's Magazine* for 1887; Leslie Stephen's *Hours in a Library* (2d series, 1877); and Bulwer Lytton's *Quarterly Essays* (1876); *Lives* by Birrell (1902) and (in French) by Douady (1907); the authoritative *Life* by P. P. Howe (1922); bibliographies by Ireland (1868) and Douady (1906). A collection of Hazlitt's works in 7 vols.—exclusive of the *Life of Napoleon*—was edited by his grandson, W. C. Hazlitt (1884-1913), who also wrote *Memoirs of him* (2 vols 1867), and *The Hazlitts* (1911). The standard edition is that edited by Waller and Glover (13 vols. 1902-6).

Head. See BRAIN, CONCUSSION, EAR, EYE, SKULL, TEETH, &c.

Head, SIR EDMUND WALKER, Bart., governor-general of Canada, was the son of the Rev. Sir John Head, and was born in 1805, near Maidstone, Kent. From Winchester he passed to Oriol College, Oxford, where he took a first in classics in 1827, and became a Fellow of Merton; in 1838 he succeeded his father, the seventh baronet. After serving as peer-law commissioner, he became in 1847 lieutenant-governor of New Brunswick, and held this post until September 1854, when he succeeded the Earl of Elgin as governor-general of Canada. He retired in 1861, was made a civil-service commissioner in 1863, and privy-councillor in 1867. He wrote a *Handbook of Spanish Painting*, and other popular books on art, and published *Ballads and other Poems, original and translated* (1868). He died 28th January 1868.

Head, SIR FRANCIS BOND, Bart., author, and governor of Upper Canada, was born at Hermitage, near Rochester, 1st January 1793. He entered the corps of Royal Engineers, served at Waterloo and elsewhere, and had attained the rank of major when he retired from the service. In 1825 he accepted an engagement from a private company to work some gold and silver mines on the River Plate; and his spirited *Rough Notes of his travels across the pampas and over the Andes* gained for him the name of 'Galloping Head.' In 1835 he became governor of Upper Canada, where, at the head of

the militia, he succeeded in suppressing an insurrection, which had its origin, as it was said, in his injudicious measures; but this charge he may fairly be held to have refuted in his *Narrative* (1839) of these events. In 1837 he resigned his post. He was created a baronet in 1836. After his retirement he devoted himself to literary pursuits, and for some years enjoyed a pension of £100 'for his services to literature.' His books include *Bubbles from the Brunnens of Nassau*, *A Faggot of French Sticks*, *Stokers and Polers*, *A Fortnight in Ireland*, *The Emigrant*, *The Horse and his Rider*, *The Royal Engineer*, and *Lives of Bruce, the traveller*, and Sir John Burgoyne. He died 20th July 1875.

Headache can scarcely ever be called a disease, but it is a common symptom of many ailments. It is sometimes caused by serious mischief within the cranium, but far more frequently it depends upon an alteration in the quality of the blood, or in a deficient or excessive supply of it to the head. The deterioration in quality may be caused by fevers, by inflammations of various organs—e.g. the kidneys, or even by breathing the air of a crowded room. The congestive form of headache is often produced by mere mechanical obstruction to the return of blood from the head. A tight collar or an awkward position of the neck during rest may cause it. This form of headache is aggravated by stooping. On the other hand the anæmic variety is often relieved by lying down. The neuralgic headache is one of the commonest of all, and is especially associated with the hysterical tendency. Another variety which is on the increase in this hurried and hard-driven generation is that caused by excessive brain-work. Lastly, there is the sick headache, mægrim or migraine, which comes on periodically in paroxysms, often associated with bilious vomiting.

The great rule for the treatment of headache is first of all to correct the general morbid condition on which it depends. Without this, local treatment is usually of little avail, and at best is only of temporary benefit. Except in anæmic cases the patient should have the head and shoulders well raised during sleep. Aperients give relief in nearly every form except the neuralgic. If the blood is deteriorated it must be improved by iron, 15 to 20 drops of the tincture of the perchloride, three times a day. Quinine is of use in periodic headaches in doses of 2 or 3 grains, three or four times a day. In neuralgic pain about the forehead menthol rubbed on often gives speedy relief. Gelsemium and Indian hemp are useful internal remedies, but opium is of doubtful value. Bromide of potassium in 30-grain doses may be given with the Indian hemp, if there is much restlessness. Of local applications cold water cloths and mustard are perhaps the most generally serviceable. In all cases the diet and habits of life should be carefully regulated.

Head Borough, an old term for the head of a borough, or high constable. See CONSTABLE.

Head-hunting. See DYAKS.

Head-money. See POLL-TAX.

Headon Beds. See OLIGOCENE SYSTEM.

Health. See HYGIENE.

Health, BILL OF, in Shipping, is a document carried by every British ship, unless engaged in the coasting trade, or specially exempted. It is granted at home by the customs, and abroad by the British consular agent, or, if there is no such person, by a British merchant or foreign consul. When no contagious or infectious disease is known to exist at the place of departure, the bill is 'clean'; when there is reason to fear the appearance of such disease, the bill is 'suspected'; when such disease actually exists, the bill is 'foul.' The

practice of other countries is identical. See QUARANTINE.

Health, BOARD OF. See PRIVY-COUNCIL.

Health-resorts, frequented for combating disease or invigorating the comparatively healthy, fall into several well-marked groups. (1) Sea-bathing quarters have long been in vogue amongst civilised nations, though the periodical exodus from cities is of modern origin. (2) The remedial and invigorating agency of mountain air has been more recently recognised, but is now fully established. Hence the popularity of many inland highland districts in Scotland, Switzerland, and Norway. (3) Curative wells have been frequented from the earliest times, and are found in many countries. The various kinds of water and their beneficial qualities are dealt with in the article MINERAL WATERS. (4) Climatic health-resorts at a high altitude, such as Davos Platz, Andermatt, Meran, &c., have come into favour because of their value for persons who are recovering from acute illness, and who are able to take active outdoor exercise; and specially for those in the early stages of phthisis, or in chronic phthisis unaccompanied by fever or blood-spitting. When there is hæmoptysis, such a climate is disadvantageous or dangerous—as it is also in cases of heart-disease, chronic bronchitis, and chronic rheumatism. (5) Residence for longer or shorter times in exceptionally temperate, mild, or warm climates is recommended for pulmonary diseases, particularly phthisis. Such favoured regions are Bournemouth, Torquay, and other places on the south coast of England and the Isle of Wight, the Riviera (Mentone, Nice, &c.), Hyères, Pozzuoli and other sheltered places in south Italy, Palermo, Madeira, Algiers, and Upper Egypt. Florida, southern California, and the pine-woods of Georgia are in favour with Americans. The climate of Colorado, bracing though not altogether mild, is also beneficial to bronchial and pulmonary weakness. In hot countries the sanitariums are usually cool hill-stations—thus, in India, Simla, Darjiling, Naini Tal, Utakamand, Pachmarhi. (6) Climatic resorts where additional help is obtained for special treatment—such as the grape cure in phthisis (Meran), whey cure (Gais in canton Appenzell), and the goat's-milk, ewe-milk, or cow's-milk cure. The influence of the pine-woods at Arcachon is supposed to be favourable to consumptive patients. Also such special devices as warm mud-baths, or the sun-bath cure (exposure of the uncovered person to the sun's heat and light), as practised at Veldes in Carinthia. (7) Hydropathic establishments generally. (8) Sea-voyages may also be here noted, as suitable for persons in the early stages of phthisis, and in cases of nervous exhaustion. See BATH, HYDROTHERAPY, MINERAL WATERS; the articles on the most notable health resorts.

Healths, DRINKING OF. See TOASTS.

Healy, TIMOTHY MICHAEL, Irish Nationalist, born in 1855 at Bantry, was called to the Irish bar in 1884, the English in 1903, and sat for various Irish constituencies from 1880 to 1918—not always an orthodox member of his party. In 1922 he became Governor-General of the Irish Free State.

Hearing. See EAR, DEAF AND DUMB, SENSATION.

Hearn, LAFCADIO (1850-1904), son of an Irish army doctor and a Greek girl, was born on the island of Leucadia, trained a journalist in the United States, and becoming a naturalised Japanese, wrote enthusiastically on things Japanese—*Glimpses of Unfamiliar Japan* (1894) proving to many a revelation. See his Life by Miss Bissland (1907).

Hearne, THOMAS (1678-1735), antiquary, born at White Waltham, Berkshire, was educated at St

Edmund Hall, Oxford, and in 1701 was appointed to a post in the Bodleian Library, of which in 1712 he became second keeper. He resigned in 1716, being unable to take the oaths to the government, but he continued to live at Oxford occupied entirely with his studies. Hearne compiled and edited no less than forty-one works, all stamped by painful and laborious learning, although poor in style, rambling in method, and often marred by the intrusion of irrelevant matter—even his Jacobitism crept into his prefaces; yet they remain solid contributions to bibliography, and their author deserved better than to be gibbeted in the *Dunciad* as a dull and dusty pedant.

His most important books were *Reliquiæ Bodleianæ* (1703), Leland's *Itinerary* (9 vols. 1710-12), Leland's *Collectanea* (6 vols. 1715), *A Collection of Curious Discourses upon English Antiquities* (1720); and editions of Camden, Alured of Beverley, William of Newburgh, Fordun, and Robert of Gloucester. The *Bibliotheca Hearniana* was published in 1848, *Reliquiæ Hearnianæ* in 1857. His autobiography is to be found in the *Lives of Leland, Hearne, and Wood* (1772). His *Collections* were edited for the Oxford Historical Society by Doble and Rannie, &c. (1885 et seq.).

Hearsay. See EVIDENCE.

Hearse, or HERSE (through Fr. from Lat. *hirpea*, 'a harrow'), the carriage in which the dead are conveyed to the grave, but originally the term applied to a triangular bar or framework with upright spikes for holding candles at a church service, and especially at funeral services. It was originally very simple in form, but in the 15th and 16th centuries hearses of great splendour came into use, and were erected in the churches over the bodies of distinguished personages. The framework was of iron or brass, sometimes of beautiful workmanship, square, octagonal, &c. in plan, with pillars at the angles, and arched framework above forming a canopy. The whole was hung over with rich cloths and embroidery, and lighted up with hundreds of wax candles, and decorated with wax images. From this the transition to the modern funeral hearse can be easily traced. In Catholic churches the old hearse still exists as a triangle with spikes, on which candles are placed.

Heart is the central organ of the circulatory system, acting as a pump in relation to the blood-vessels. The heart's action in maintaining the circulation of blood is among the most important of the bodily functions, and disease or disorder of this organ occupies the chief position among the causes of death. The mutual influence subsisting between the heart, other important organs, especially the nervous system, and the general vitality is very great. This has caused the heart to be regarded as the seat of emotions and virtues, so that expressions like 'faint-hearted,' 'good-hearted,' 'lion-hearted' have been used from the earliest times, and the influence of profound emotion is indicated by such a term as 'broken heart.' The heart arises as a strong development of one or more blood-vessels, which gains special power of contraction. By bending on itself, the development of partitions, and the ingrowth of folds to form valves, chambers connected with one another are produced in its interior. The heart is placed dorsally in invertebrates, and ventrally in vertebrates. In the latter it arises in the neck region, and later in the course of development sinks downwards into the chest, enclosed in a double bag, the *pericardium*, whose smooth surfaces facilitate its beating.

The human heart lies towards the front of the chest, between the two lungs. It is about the size of the owner's closed fist, and two-thirds of its bulk extends to the left of the middle line. It has a broader end or *base* directed upwards, backwards,

and to the right, and a narrower end or *apex* directed downwards, forwards, and to the left. Its lower surface is supported on the diaphragm, by which it is separated from the stomach and liver immediately below. Its front surface, over a triangular area of a few square inches, rests directly

Fig. 1.—Section of the Human Heart (after His):

A, right atrium; B, right ventricle; C, left ventricle; D, left atrium; E, partition between the two ventricles. Between the atria and ventricles on right and left, the tricuspid and mitral valves with their cords and associated muscles are shown.

the impure blood from the head and body by the *venæ cavæ*, and that from the substance of the heart itself by the *coronary sinus*. From the right atrium the right atrio-ventricular opening, guarded by a valve of three irregularly shaped cusps (*tricuspid valve*), leads to the right ventricle, and from

Fig. 2.—Diagram of Heart halved and laid open (after Deblieffe):

A, B, C, D, as in fig. 1. *a*, part of tricuspid valve; *b*, part of mitral; *c*, semilunars at base of pulmonary artery. *a'*, *a''*, inferior and superior *venæ cavæ* entering A; *b'*, *b''*, pulmonary arteries proceeding from B; *c'*, *c''*, aorta proceeding from C; *d'*, *d''*, pulmonary veins entering D.

the left atrium or auricle receives the pulmonary veins, which convey the purified blood from each lung, and from it the left atrio-ventricular opening, guarded by the *mitral valve* of two irregularly shaped cusps, leads to the left ventricle. At the exit of the left ventricle into the aorta is placed the *aortic valve*, formed of three pocket-like segments, which prevent backflow of blood from this large vessel. The muscular wall of the veins and auricles is relatively thin, that of the right ventricle

is much thicker, while that of the left ventricle, which exerts great propulsive power in driving the blood all over the body, is over $\frac{1}{2}$ inch in thickness. The walls of the ventricles are strengthened by numerous bands and columns of muscle protruding from the interior surface (*columnæ carneæ*), and certain muscular projections (*musculi papillares*) are attached by tendinous cords (*cordæ tendinæ*) to the edges of the tricuspid and mitral valves, whose movements they restrict. The outer surface of the heart is covered by the smooth pericardial membrane, and the interior of its chambers is similarly lined by a smooth glistening membrane (*endocardium*), which also covers each surface of the valves. The heart muscle is richly supplied with blood by two *coronary arteries*, which spring from the aorta immediately beyond the aortic valve and distribute numerous branches over the surface. The heart receives nerves from the brain, branches of the *vagus nerve*, and from the sympathetic system, by which its beating is slowed and accelerated respectively. In the heart itself are several nervous nodes or ganglia, and the contractions of the auricles are communicated to the ventricles by a special band of muscle lying in the septum between the ventricles (*auriculo-ventricular bundle of His*).

Each beat of the heart begins at the place where the great veins enter, and the two atria contract together. The two ventricles immediately thereafter contract together, and in doing so close the tricuspid and mitral valves and open the pulmonary and aortic valves. This active part of the cardiac cycle is known as *systole*. As soon as the blood has passed from the ventricles into the great arteries the pressure in the latter and the relaxation of the ventricles cause the pulmonary and aortic valves to close, and the resting phase or *diastole* of the heart ensues. The closure of each pair of valves produces a sound audible if the ear is laid on the chest or applied through a stethoscope. These are known as the *first sound* and *second sound* of the heart. The systole of the auricles lasts about $\frac{1}{10}$ second, that of the ventricles about $\frac{1}{3}$ second, and the diastole about $\frac{1}{4}$ second. The frequency of the beats is commonly about 72 per minute, being four times as rapid as the respirations.

Examination of the Heart.—The heart is directly examined by various methods; and, when disease is present, the evidence of its effect on other organs—e.g. the arteries, lungs, kidneys, &c., is of great importance in estimating the severity of the disorder. Certain symptoms are common at an early stage of most cardiac disorders—e.g. shortness of breath on exertion, discomfort felt in the left side of the chest, and swelling of the feet towards evening; at a more advanced stage, palpitation, marked difficulty in breathing, irregularity or other changes in the pulse, and blueness of the lips, ears, and finger nails are noticed; serious manifestations are found in throbbing in the chest, severe pain known as *angina pectoris*, fainting seizures, spitting of blood, marked dropsy of the legs and cavities of the body with jaundice and dyspepsia. When the kidneys become affected, in consequence of defective circulation through them, the various effects found in Bright's disease are superadded.

Important signs of heart affection are afforded by the *pulse* or wave communicated to the vessels, and felt over the radial artery at the wrist, over the carotid artery in the neck or elsewhere. Undue quickening of the rate is found when the heart is enfeebled, irregularity is specially characteristic of defects of the mitral valve with consequent distension of the auricles. These and other characters of the pulse are recorded and minutely studied in tracings taken by means of an instru-

ment known as the 'sphygmograph.' The pressure that is required to obliterate the pulse, or *blood pressure*, gives information as to the power with which the heart is contracting at the time, and also as to the general state of thickening and hardness present in the arteries, which are in many cases diseased along with the heart; the blood-pressure is gauged roughly with the finger or measured accurately by means of the 'sphygmomanometer.' The size of the heart and character of its action can be determined by laying the palm of the hand on the region of the left breast; the apex is normally felt beating between the fifth and sixth left ribs at a point from $3\frac{1}{2}$ to 4 inches distant from the middle line of the body. In children it is relatively higher, and in persons with narrow chest formation it may be lower, while a heart that is enlarged by disease has its apex pushed outwards, it may be as far as the middle of the side. The right and left borders of the heart can be delineated also by the method of 'percussion,' and the outline of the heart can be readily seen in the shadow cast by it on X-ray examination. The method of examination by 'auscultation' is of the greatest importance in the case of disease of the valves. The valves in closing produce clear and distinctive 'sounds,' but when one or more of these structures is diseased, *murmurs* of a blowing or rasping character may precede, follow, or completely replace the heart 'sounds.' According to its character, time of occurrence, or the position on the chest where a murmur is heard, the valve that is affected and the nature of its affection can be determined. A valuable method of examination has been introduced in recent years, by studying the *electrical state* produced in the heart as it contracts. For this purpose the patient's limbs are immersed in salt solution and a galvanometric record of the changing current, that passes through the patient's body as the heart contracts, is obtained without discomfort. The apparatus used is known as the 'electrocardiograph.' The *functional capacity* of the heart is one of the most important aspects from which it is examined. This consists in the power of the heart to tolerate exertion without the pulse or breathing becoming unduly quickened. A heart that is acting well should not, after such an exercise as stooping to touch the toes twenty times, be quickened by more than one-third of its rate at rest, and it should resume its previous rate within two minutes of completing the exercise.

DISEASES OF THE HEART may be classified as those in which there is some definite defect or diseased change in the structure of the heart (*organic disease*), and those in which a name is applied to some error in action (*functional disease*). In the latter case the underlying cause is often of a temporary nature, and the disorder may disappear after a time.

1. *Organic heart diseases*.—It is usual to classify these according as the sac surrounding the heart (*pericardium*), the muscle of the heart (*myocardium*), or the lining membrane (*endocardium*), is chiefly affected.

Pericarditis, or inflammation of the pericardium, is a not uncommon result of rheumatic fever, and it may occur in a severe form in connection with some of the infectious diseases, or with general blood poisoning (*pyæmia*), or at the end of chronic diseases like nephritis. Fluid tends to collect to an excessive extent in the sac, either clear serous fluid in the milder cases, or purulent fluid in the cases which have a fatal termination. Fibrin also is deposited on the pericardial surfaces, which may

thus become permanently adherent, with great consequent embarrassment of the heart's action. In some chronic cases the condition is tuberculous in nature following upon this disease in the lungs.

Myocarditis is the name applied to various inflammatory and degenerative conditions of the heart wall. It may be of an acute nature and is then often transitory, or the change may be chronic, and it then forms a serious menace to life. The acute form includes the *cloudy swelling* and other more serious changes that commonly result in connection with prolonged fever, and render the heart temporarily weak, so that it readily dilates if efforts be made too soon or too violently during convalescence. Such a change is one of the common causes of death in acute febrile diseases; but, if the condition is not pronounced, recovery of the heart is usually complete, although the resulting *dilatation*, or rapid action, may persist for months or years. In the chronic forms, the muscular tissue may disappear over considerable areas, being replaced gradually by fibrous tissue or fat. These changes constitute *fibroid degeneration* and *fatty infiltration*, and are commonly produced by defective blood supply due to disease of the coronary arteries of the heart. Such a condition of the heart leads to various disorders of action, and is very liable to result in sudden death. Another form of degeneration occurs in *anæmia* and other wasting diseases as a *fatty degeneration* commencing within the muscle fibres, leading to dilatation and tending to a similar fatal issue. In some diseases associated with great increase of blood-pressure—e.g. in chronic Bright's disease, the heart becomes enlarged in size and strengthened in power (*hypertrophy*). Up to a moderate degree this change is salutary, and it forms, for example, a necessary part of the 'training' of an athlete, and is found always in those who do heavy labour, such as miners and navvies. When it is excessive it produces pain and palpitation, and enlarging in this case from disease, the heart in time reaches the limit of hypertrophy and begins to fail (*decompensation*), with the symptoms already mentioned.

Endocarditis begins as an inflammatory condition of the lining membrane, particularly in that part which forms the surface of the valves. It is found especially as a sequel of rheumatic fever and scarlet fever, but it sometimes results from other infectious diseases, or even from such apparently mild inflammatory conditions as tonsillitis or that accompanying defective teeth. *Simple acute endocarditis* may give little or no sign of its presence, unless the heart be specially examined. As time proceeds the process of healing in the valves leads to thickening, shrinkage, and adhesion of these structures, and this condition of *chronic endocarditis* may be discovered quite accidentally on medical examination, or may set up symptoms of cardiac disease only after a number of years have elapsed since the illness which originally caused its acute stage. This forms the common type of chronic valvular heart disease, and gradually leads to hypertrophy of the muscle (*compensation*) and other changes. The heart may continue as a result of this compensatory process to act satisfactorily for many years, but it is apt to give way following some illness, some unusual strain, or in any case with the weakness that accompanies old age. When this takes place the train of symptoms already mentioned appears. Some forms of chronic valvular diseases are more serious than others, thus incompetence of the aortic valve to withstand the back-flow of blood is the most serious, narrowing of the mitral valve comes second in importance, while valvular changes of any importance seldom occur on the right side of the heart. A slow degenerative

change (*atheroma*) also appears without a previous acute attack, this form especially tending to affect the aortic valve, and, when it occurs, being commonly a late result of syphilis. *Acute ulcerative endocarditis* is an occasional but very fatal form which occurs in connection with general blood-poisoning (*pyæmia*), the development of organisms in the valves, and their dissemination through the blood to distant parts of the body. Some cases of heart disease are due to defective formation of the heart—e.g. an incomplete septum between the ventricles, malformation of the valves, &c. These cause symptoms in early life, and the term *congenital heart disease* is applied to this group.

2. *Functional disorders of the heart.*—Some of these disorders arise from conditions outside the heart, others are dependent on organic changes in the heart itself, but vary from time to time. *Palpitation*, or unpleasant consciousness of the heart's beating, is found with many forms of heart disease, but is often due simply to emotional or nervous conditions. A form of irregularity of the pulse known as *sinus irregularity*, which causes the heart occasionally to miss or delay beats, is found as a result of nervous influences or of dyspepsia or excessive use of tea, tobacco, and similar substances; this occurs usually in young people with otherwise healthy hearts, and is not of serious import. Another condition of irregularity in the pulse, known as *extrasystole*, is produced by irritability of the heart muscle, causing it occasionally to beat too soon and then pause for an undue length of time before the next beat; this also is not of serious nature. The most common cause of persistent irregularity in the pulse is a condition in which the auricles are dilated and fail to contract (*auricular fibrillation*), their muscle fibres showing twitching movements instead. It is commonly an accompaniment of valvular disease affecting the mitral valve, and although the valvular disease is permanent, the fibrillation and irregularity of the pulse may disappear for a time with rest and appropriate treatment. *Heart-block* is dependent upon some disease of the heart muscle interfering with the auriculo-ventricular bundle, and causes slowness of the pulse. In itself it is not a serious condition, but it usually indicates some very serious and progressive degeneration of the heart. *Tachycardia*, or unusual rapidity of the heart-beat, and *bradycardia*, or undue slowness, are due to a variety of causes (see PULSE). *Angina pectoris* is an agonising spasm of the heart muscle (see ANGINA PECTORIS).

Heart, SACRED. See SACRED HEART.

Heart-burial, or the burial of the heart in a place separate from that in which the body is laid, seems to have been once practised by the ancient Egyptians. In European countries it was most common in the 12th and 13th centuries, though instances have occurred in all centuries down to and including the 19th. The practice undoubtedly arose out of the special veneration in which the heart was held as the seat of the affections and of certain of the higher virtues, as courage, piety. Besides the heart, other parts of the body, such as the viscera, were sometimes honoured with separate burial. It has been suggested that this distribution of the body for sepulture was prompted by a wish to secure the prayers of more than one congregation for the soul of the deceased. In other instances, where the deceased has died abroad and his heart has been carried home for burial, the motive is simpler to understand. The persons who have been honoured with separate burial for the heart have been for the most part men and women of royal birth and ecclesiastics of high rank. Amongst royal personages may be enumerated Henry I. and Richard I. of England, whose hearts were interred at Rouen; Henry III., whose heart

was buried at Fontevraud in Normandy; Eleanor, wife of Edward I., at Lincoln; Edward I. himself, whose heart was sent to Jerusalem for burial, as was that of Robert Bruce (brought back to Melrose); the French kings, Louis XII., XIII., and XIV., Francis I. and II., and Henry II. and III.; the Emperor Leopold, and James II. of England, whose heart was entombed in St Mary of Chaillet near Paris. The heart of Anne de Montmorency, Constable of France, was interred at Les Célestins; that of Lord Edward Bruce at Culross Abbey, his body in Bergen-op-Zoom in Holland; and that of Sir William Temple at Moor Park, near Farnham. The viscera of the popes from Sixtus V. (1590) onwards were interred in SS. Vincenzo and Anastasio, the parish church of the Quirinal. Daniel O'Connell's heart is buried at Rome; Shelley's ('*cor cordium*') at Bournemouth; and that of the French marshal, Kellermann, on the battlefield of Valmy. The practice was prohibited by Pope Boniface VIII. (1294-1303); but the prohibition was removed by Benedict XI., at all events so far as the French royal family was concerned. The Marquis of Bute's heart was carried to Jerusalem and buried on the Mount of Olives in November 1900. See Pettigrew, *Chronicles of the Tombs* (1857), pp. 249 *et seq.*

Heart-burn. See INDIGESTION.

Hearth-money, an unpopular tax of two shillings levied on every hearth in all houses 'paying to church and poor,' first imposed in 1663, and abolished in 1689.

Heart's Content, a port of Newfoundland, on the east side of Trinity Bay, with 1000 inhabitants, is an Atlantic cable terminus.

Heart's-ease. See VIOLET.

Heat, the cause of the sensation of warmth, and of a multitude of common phenomena in nature and art. In considering this subject scientifically it is necessary from the outset to discard the ideas conveyed by the popular use of such words as hot and cold. A number of bodies, however different, left for a long enough time in the same room, must, as we shall see farther on, acquire the same *temperature*, or become in reality quite warm. Yet in popular language some, as metals, stones, &c., are pronounced to be cold, and others, as flannel and fur, warm. The touch, then, is not a means by which we can acquire any definite idea of the temperature of a body.

Nature of Heat.—A heated body is no heavier than it was before it was heated; if, therefore, heat be a material substance, as it was long considered, it must be *imponderable*. But if it were *matter*, in any sense of the word, its quantity would be unchangeable by human agency. Now we find that there are cases in which heat is produced in any quantity without flame, combustion, &c., as in melting two pieces of ice by rubbing them together, and also cases in which a quantity of heat totally disappears. This is utterly inconsistent with the idea of the materiality of heat. The only hypothesis that at all accords with the phenomena is that *heat depends upon motion of the particles of a body*, being in fact Energy (q.v.), not matter; and with this idea we shall start.

Temperature.—When two bodies are placed in contact, heat will in general pass from one to the other, with the effect of cooling the first and warming the second. This process goes on until the two acquire the same temperature. Thus temperature is a condition of a body, determining, as it were, the *head* of the heat which the body contains—to take the obvious analogy of water in a cistern or a mill-pond. In this sense it is analogous also to the pressure of gas in a receiver, or to the potential in

an electrified conductor. By the help of the 'specific heat' of bodies (which will be treated later) we can determine from their change of temperature how much heat they gain or lose. The scientific or *absolute* measurement of temperature can only be alluded to here. It depends upon theoretical considerations, for which see THERMO-DYNAMICS.

Measure of Heat.—Whether it be a vibration, such as light and sound (as in some cases it certainly is), or consist in independent motions of the particles of a body, leading to a succession of *impacts* on each other and on the walls of the containing vessel (as is almost certainly the case in gases), it is none the less certain that the *amount* of heat in a body is to be measured by the energy of moving particles. But as we cannot observe those particles so as to ascertain their vis-viva, we must have as a preliminary some artificial unit in terms of which to measure heat. This will be described later. But in order that this process may be applied we must have some means of measuring the temperature of a body, depending upon an *effect* of heat. Whatever that effect may be, it is obvious that, as the laws of nature are uniform, it will afford us a *reproducible* standard, by which we can estimate at any time and at any place an amount of heat, and compare that amount with another observed somewhere else; just as the French Mètre (q.v.) is reproducible at any time, being (at least by its original definition) the ten-millionth part of a quadrant of the meridian.

Dilatation or Expansion.—Now, one of the most general and notable effects which heat produces on matter is to *expand* it. The length of a metallic bar varies with every change of temperature, and is ever the same at the same temperature. The fixing of the tire of a cart-wheel is a very good instance. No hammering could fit an iron hoop so tightly on the wood-work of the wheel as does the simple enlarging of the tire by heat, and its subsequent contraction by cold. It is thus possible to *slip* it on, and an enormous force is secured to bind the pieces together. In almost every kind of structure the expansion and contraction from changes of temperature require to be guarded against. In the huge iron tubes of the Britannia Bridge the mere change of the seasons would have produced sufficient changes of length to tear the piers asunder, had each end of a tube been fixed to masonry. Watches and clocks, when not compensated (see PENDULUM), go faster in cold weather, and slower in hot, an immediate consequence of the expansion or contraction of their balance-wheels and pendulums.

If a flask *full* of water or of alcohol be dipped into hot water or held over a lamp, the flask is heated first, and for a moment appears not quite full, but as heat reaches the liquid it expands in turn, and to a greater degree than the flask, so that a portion of the liquid runs over; a glass shell which just floats in a vessel of water, sinks to the bottom when the water is heated; and as water is gradually heated from below, the hotter water continually rises to the surface. Indeed, if this were not the case, it would be impossible to prevent explosions every time we attempted to boil water or any other fluid. If a bladder, partly filled with air, and tightly tied at the neck, be heated before a fire, the contained air will expand, and the bladder will be distended. As it cools it becomes flaccid again by degrees.

These and like instances are sufficient to show us that in *general* all bodies expand by heat. In order, then, to prepare a reproducible means of measuring temperature, all we have to do is to fix upon a substance (mercury is that most commonly used) by whose changes of volume it is to be measured, and a reproducible temperature, or rather two reproducible

temperatures, at which to measure the volume. Those usually selected are—that at which water freezes, or ice melts, and that at which water boils. In both of these cases the water must be *pure*, as any addition of foreign matter in general changes the temperature at which freezing or boiling takes place. Another important circumstance is the *height of the barometer* (see BOILING). The second reproducible temperature is therefore defined as that of water boiling in an open vessel when the barometer stands at 30 inches. In absolute strictness, this should also be said of the freezing-point, but the effect on the latter of a change of barometric pressure is practically insensible. The practical construction of a heat-measurer or *thermometer* on these principles, the various ways of graduating it, and how to convert the readings of one thermometer into those of another, are described in the article THERMOMETER. In the present article we suppose the Centigrade thermometer to be the one used.

If we make a number of thermometer tubes, fill them with different liquids, and graduate as in the Centigrade, we shall find that, though they all give 0° in freezing and 100° in boiling water, no two in general agree when placed in water between those states. *Hence the rate of expansion is not generally uniform for equal increments of temperature.* It has been found, however, by very delicate experiments, which cannot be more than alluded to here, that mercury expands *nearly* uniformly for equal increments of temperature. However, what we sought was not an *absolute* standard, but a *reproducible* one; and mercury, in addition to furnishing this, may be assumed also to give us approximately the ratios of different increments of temperature.

We must next look a little more closely into the nature of dilatation by heat. And first, of its *measure*. A metallic rod of length l at 0° increases at t° by a quantity which is proportional to t and to l . Hence, k being some numerical quantity, the expanded length $l' = l(1 + kt)$. Here k is called the coefficient of linear dilatation. For instance, a brass rod of length 1 foot at 0° becomes at t° $(1 + .0000187t)$ feet; and here k , or the coefficient of linear dilatation for one degree (Centigrade), is .0000187; or a brass rod has its length increased by about one fifty-three thousandth part for each degree of temperature.

If we consider a bar (of brass, for instance) whose length, breadth, and depth are l, b, d —then, when heated, these increase proportionally. Hence

$$\begin{aligned} l' &= l(1 + kt), \\ b' &= b(1 + kt), \\ d' &= d(1 + kt), \end{aligned}$$

and therefore the volume of, or space occupied by, the bar increases from V or lbd to V' or $l'b'd'$.

Hence $V' = V(1 + kt)^3$,

$= V(1 + 3kt)$ nearly, since k is very small.

Therefore we may write $V' = V(1 + Kt)$, where we shall have as before K , the coefficient of *cubical* dilatation for 1° of temperature. And, as $K = 3k$, we see that, for the same substance, the *coefficient of cubical dilatation is three times that of linear dilatation*.

In the following table these coefficients are increased a hundredfold, as it gives the proportional increase of length for a rise of temperature from 0° to 100° Centigrade. It must also be remarked that, while the *linear* dilatation of solids is given, it is the cubical dilatation of liquids and gases which is necessarily given. Moreover, as the latter are always measured in glass, which itself dilates, the results are only *apparent*; they are too small, and require correction for the cubical dilatation of glass. This, however, is comparatively very

small, and a rough approximation to its value is usually sufficient.

Glass	·00086	Water	·0432

Zinc	·00294	Air	·3665
Mercury	·01803	Hydrogen	·3668

There is one specially remarkable exception to the law that bodies expand by heat—viz. that of water under certain circumstances. From 0° (Centigrade), at which it melts, it *contracts* as the temperature is raised, up to about 4° C., after which it begins to expand like other bodies. We cannot here enter into speculations as to the cause of this very singular phenomenon, but we will say a few words about its practical utility. Water, then, is *densest* or *heaviest* at 4° C. Hence, in cold weather, as the surface water of a lake cools to near 4°, it becomes heavier than the hotter water below, and sinks to the bottom. This goes on till the whole lake has the temperature 4°. As the surface-cooling proceeds further, the water becomes *lighter*, and therefore remains on the surface till it is frozen. Did water not possess this property, a severe winter might freeze a lake to the bottom, and the heat of summer might be insufficient to remelt it all.

Specific Heat.—The thermometer indicates the temperature of a body, but gives us no direct information as to the *amount* of heat it contains. Yet this is measurable, for we may take as our UNIT the amount of heat required to raise a pound of water from 0° to 1°, which is of course a definite standard. As an instance of the question now raised—Is more heat (and if so, *how much more*) required to heat a pound of water from zero to 10° than to heat a pound of mercury between the same limits? We find by experiment that bodies differ extensively in the amount of heat (measured in the units before mentioned) required to produce equal changes of temperature in them.

It is a result of experiment (sufficiently accurate for all ordinary purposes) that, if equal weights of water at different temperatures be mixed, the temperature of the mixture will be the arithmetic mean of the original temperatures. From this it follows, with the same degree of approximation, that equal successive amounts of heat are required to raise the same mass of water through successive degrees of temperature. As an instance, suppose one pound of water at 50° to be mixed with two pounds at 20°, the resulting temperature of the mixture is 30°; for the pound at 50° has lost 20 heat units, while each of the other two pounds has gained 10 such units, transferred of course from the hotter water. Generally, if m pounds of water at t degrees be mixed with M pounds at T degrees (the latter being the colder), and if θ be the temperature of the mixture—the number of units lost by the first is $m(t - \theta)$, since one is lost for each pound which cools by one degree; and that gained by the second is $M(\theta - T)$, and these must be equal. Hence $m(t - \theta) = M(\theta - T)$; whence, at once,

$$\theta = \frac{mt + MT}{m + M}.$$

But if we mix water and mercury at different temperatures, the resulting temperature is found *not* to agree with the above law. Hence it appears that to raise equal weights of different bodies through the same number of degrees of temperature requires different amounts of heat. And we may then define the *specific heat* of a substance as the number of units of heat (as above defined) required to raise the temperature of one pound of it by one degree.

From the definition of a unit of heat it is at once seen that our numerical system is such that the specific heat of water is unity; and, in general, the specific heats of other bodies are less, and are

therefore to be expressed as proper fractions. For example, if equal weights of water and mercury be mixed, the first at 0°, the second at 100°, the resulting temperature will not be 50° (as it would have been had both bodies been water), but 3°·23 nearly; in other words, the amount of heat which raises the temperature of one pound of water 3°·23 is that which would raise that of one pound of mercury 96°·77, or the specific heat of mercury is $\frac{3}{96}$ th of that of water. The following may be given as instances of the great differences which experiment has shown to exist among bodies in respect of specific heat: Water, 1·000; turpentine, ·426; sulphur, ·203; iron, ·114; mercury, ·033.

It is mainly to the great specific heat of water that we are indebted for the comparatively small amount of it required to cool a hot body dropped into it; for its comparatively small loss of temperature when it is poured into a cold vessel; and for the enormous effects of the water of the ocean in modifying climate, as by the Gulf Stream.

It has been found generally that the specific heats of elementary solids are nearly *inversely* as their Atomic Weights (q.v.). Hence their atoms require the same amount of heat to produce the same change in their temperature. Thus, for simple bodies, we have atomic weight of mercury, 100; its specific heat, ·033; product, 3·3; atomic weight of iron, 28; its specific heat, ·114; product, 3·2. A similar remark may be made, it appears, with reference to compound bodies of any one type; but, in general, the product of the specific heat and the atomic weight differs from one type to another.

Latent Heat, Fusion, Solution, and Vaporisation.

—We are now prepared to consider the somewhat complex effects produced by heat on the molecular constitution of bodies; and, conversely, the relations of solidity, fluidity, &c. to heat. All solid bodies (except carbon, which has been softened only) have been melted by exposure to a sufficiently high temperature. The laws of this fusion are:

(1) Every body has a definite melting-point, assignable on the thermometric scale, if the pressure to which it is subjected be the same.

(2) When a body is melting, it retains that fixed temperature, however much heat may be supplied, until the last particle is melted. The last result is most remarkable. The heat supplied does not raise the temperature, but produces the change of state. Hence it seemed to disappear, as far as the thermometer is concerned, and was therefore called *latent heat*.

A pound of water at 79° C. added to a pound of water at 0° C. produces, of course, two pounds of water at 39°·5. But a pound of water at 79° C. added to a pound of ice at 0° C. produces two pounds of water at 0°. Heat, then, has *disappeared* in the production of a change from solidity to fluidity. And this we might expect from the conservation of Energy (q.v.), for energy in the shape of heat must be consumed in producing the potential energy of the molecular actions of the separate particles in the fluid. For every pound of ice melted, without change of temperature, 79 units of heat are thus converted into potential energy of molecular separation.

We give a few instances of latent heat of fusion: Water (as above), 79·0; zinc, 28·1; sulphur, 9·4; lead, 5·4; mercury, 2·8.

In law 1 it is mentioned that constancy of pressure is necessary. In fact, the freezing (or melting) point of water is *lowered* by increase of pressure, while those of sulphur or wax are *raised*; but these effects, though extremely remarkable, are *very small*. Most bodies contract on solidifying; but some, as water, cast-iron, certain alloys, &c., *expand*. Thus a severe frost, setting in after

copious rain, splits rocks, &c., by the expansion of freezing water; and thus also we obtain in iron the most delicate and faithful copy of a mould, and in the fusible alloy a clear-cut copy of a type. The modern dynamical theory of heat (thermo-dynamics) enables us to see that a perpetual motion would be procurable if bodies which contract on solidifying had *not* their melting-point raised by pressure, and *vice versa*.

Analogous to the fusion of a solid is its *solution* in a liquid, or the mutual conversion into liquids of two solids which are intimately mixed in powder. Here, also, we should expect kinetic energy, in the shape of heat, to be used up in producing the potential energy of the liquid state; and, indeed, such is always the case. Such changes of arrangement destroy heat or produce cold; but this in many cases is not the effect observed, as there is generally heat developed by the *loss* of potential energy if there be *chemical* action between the two substances. Hence, in general, the observed effect will be due to the difference of the heat *generated* by chemical action and that *absorbed* in change of state.

If a quantity of pounded nitrate of ammonia (a very soluble salt) be placed in a vessel, an equal weight of water added, and the whole stirred for a minute or two with a test-tube containing water, the heat required for the solution of the salt will be abstracted from all bodies in contact with the solution, and the water in the test-tube will be frozen. In this sense the arrangement is called a *freezing mixture*. For additional illustrations of heat becoming latent, see FREEZING MIXTURES.

Of course the converse of this may be expected to hold, and latent heat to become sensible when a liquid becomes solid. As an example, when a supersaturated solution of sulphate of soda begins to deposit crystals of the salt with great rapidity the temperature rises very considerably; and it is the disengagement of latent heat that renders the freezing of a pond a slow process, even after the whole of the water has been reduced nearly to the freezing-point.

Vaporisation.—Almost all that has been said on the subject of fusion is true of vaporisation, with the change of a word or two. Thus, however much heat we supply to a liquid, the temperature does not rise above the boiling-point. Heat, then, becomes *latent* in the act of vaporisation, or rather is *converted into* the potential energy involved in the change of state. It is found by experiment that 540 units of heat (each sufficient to heat a pound of water 1° C.) disappear in the conversion of a pound of water into steam. Hence a pound of steam at 100° C. is sufficient to raise 5·4 pounds of water from zero to the boiling-point.

COMMUNICATION OF HEAT.—There are at least three distinct ways in which this occurs, and these we will take in order.

Conduction.—Why is it that, if one end of a poker and of a glass or wooden rod be put into a fire, we can keep hold of the other end of the latter much longer than we can of the former? The reason is that heat is more readily transmitted in the iron from particle to particle than it is in glass or wood. This is conduction. It is to be noticed, however, that in this experiment a great portion of the heat which passes along each rod is given off into the air by the surface. The mathematical theory of conduction has been most exquisitely investigated by Fourier, but on the supposition that the rate at which heat passes from a warmer to a colder portion of a body is proportional to the *difference* of temperature. As most of the experiments which have been made with the object of ascertaining the *conductivity* (not

conductibility, the erroneous word too commonly in use) of different bodies have been made in this way, it is not surprising that our knowledge on this point is very meagre indeed. We know that silver and copper conduct better than most other metals, and that the metals in general conduct better than other solids; but our further information is neither very extensive nor very definite. The first determinations of conductivity which are at all trustworthy are those of Forbes. His method was immensely superior to those of his predecessors. Before we give one or two numerical data, we must explain what the numbers mean. The following definition is virtually that of Fourier:

The thermal conductivity of a substance is the number of units of heat which pass per unit of surface per unit of time, through a slab of unit thickness, whose sides are kept at temperatures differing by 1° C. Taking the unit of heat as above described, a foot as unit of length and a minute as unit of time, the conductivity of iron is about 0·8, while that of copper varies from 4 to little more than 2. (Very slight impurities affect to a great extent both the thermal and the electric conductivity of copper.) Contrasted with these we find that the conductivity of rocks is very small, ranging from 0·015 to 0·04.

In conjunction with their radiating power (see next section), the conductivity of bodies is most important as regards their suitability as articles of clothing for hot or cold climates, or as materials for building or furnishing dwelling-houses. We need but refer to the difference between linen and woollen clothing, or to the difference (in cold weather) of sensation between a carpet and a bare floor, in order to show how essential the greater or less conducting power of bodies is to our everyday comfort.

Radiation.—By this is understood the passage of heat, not from particle to particle of one body, but through air or vacuum, and even through solid bodies (in a manner and with a velocity quite different from those of conduction) from one body to another. There can be no doubt whatever as to radiant heat being *identical* with light, differing from red light, for instance, as red light differs from blue—i.e. having (see LIGHT) longer waves than those corresponding to red light. This idea might easily have arisen during the contemplation of a body gradually heated. At first it remains dark, giving off only rays of heat; as its temperature increases it gives us, along with the heat, a low red light, which, by the increase of the temperature, is gradually accompanied by yellow, blue, &c. rays, and the incandescent body (a lime-ball, for instance) finally gives off a light as white as that of the sun, and which therefore contains all the colours of sunlight in their usual proportions. In fact there is great reason to believe that the sun is merely a mass of incandescent matter, probably in the main gaseous, and that the radiations it emits, whether called heat or light, merely differ in *quality*, not in *kind*. Taking this view of the subject at the outset, it will be instructive to compare the properties of radiant heat with those of light throughout. It must be understood when we make this comparison that the term *heat* is improperly used in this connection. Radiant heat is not heat in the ordinary sense of the word. It is a form of energy, a *transformation* of the heat of a hot body, and can be transformed into heat again when it is absorbed, but on its passage it is not what we ordinarily understand by the word heat.

Light, then, *moves* (generally) in *straight lines*. This is easily verified in the case of heat by the use of the thermo-electric pile and its galvanometer.

meter. Placing the pile *out* of the line from a source of heat to an aperture in a screen, *no* effect is observed; but deflection of the needle at once occurs when the pile is placed in the line which light would have followed if substituted for the heat.

A concave mirror, which would bring rays of light proceeding from a given point to a focus at another given point, does the same with heat, the hot body being substituted for the luminous one, and the pile placed at the focus. Heat, then, is *reflected* according to the *same laws* as light. A burning lens gives a capital proof of the sun's heat and light being subject to the same laws of *refraction*. When the solar Spectrum (q.v.) is formed by means of a prism of rock-salt (the reasons for the choice of this material will afterwards appear), the thermo-electric pile proves the existence of heat in all the coloured spaces, increasing, however, down to the red end of the spectrum, and attaining its maximum *beyond* the visible light, just as if radiant heat were (as it *must* be) light with longer waves.

Some bodies, as glass, water, &c., transmit, when in thin plates, most of the light which falls on them; others, as wood, metal, coloured glass, &c., transmit none or little. A plate of rock-salt, half an inch thick, transmits 96 per cent. of the rays of heat which fall on it; while glass, even of a thickness of one-tenth of an inch, transmits very little. In this sense, rock-salt is said to be *diathermanous*, while glass is said to be *adiathermanous*, or only partially diathermanous. Most of the simple gases, such as oxygen, hydrogen, &c., and mixtures of these, such as air, oppose very little resistance to the passage of radiant heat; but the reverse is in general the case with compound gases. It has been asserted that water-vapour in particular is exceedingly adiathermanous. The question is one of very considerable difficulty, owing to the fact that it is almost impossible to experiment upon vapour alone. The presence of dust particles always produces deposition of *water*, which is a very good absorber of radiant heat.

But there are other remarkable phenomena of radiant heat which are easily observed, and which have their analogy in the case of light. (1) Unstained glass seems equally transparent to all kinds of light. Such is the case with rock-salt and heat. (2) Light which has passed through a blue glass (for instance) loses far less per cent. when it passes through a second plate of blue glass. Similarly heat loses (say) 75 per cent. in passing through *one* plate of crown-glass, and only 10 per cent. of the remainder (say) in passing through a second. (3) Blue light passes easily through a *blue* glass, which almost entirely arrests red light. So dark heat passes far less easily through glass than bright heat does. These analogies, mostly due to Melloni, are very remarkable.

Again, light can be *doubly refracted*, *plane polarised*, *circularly polarised*. All these properties were found in radiant heat by Principal Forbes.

The beautiful investigations of Stokes, Balfour Stewart, and Kirchhoff have shown us that bodies which most easily *absorb* light of a particular colour give off most freely, when heated, light of that colour; and it is easily shown by experiment that those surfaces which absorb heat most readily also radiate it most readily. Thus, it was found by Leslie that when a tinned-iron cube full of boiling water had one side polished, another roughened, a third covered with lampblack, &c., the polished side radiated little heat, the roughened more, while the blackened side radiated a very great quantity indeed. And again, that if we have (say) three similar thermometers, and if the

bulbs be (1) gilded, (2) covered with roughened metal, (3) smoked, and all be exposed to the same radiation of heat, their sensibility will be in the order 3, 2, 1. A practical illustration of this is seen in the fact that a *blackened* kettle is that in which water is most speedily made to boil, while a polished one keeps the water longest warm when removed from the fire. Again, if a willow-pattern plate be heated white-hot in the fire, and then examined in a dark room, the pattern will be reversed—a white pattern being seen on a dark ground. It is this law of equality of radiating and absorbing powers that mainly gives rise to the superior comfort of white clothing to black in winter as well as in summer; radiating less in winter, it absorbs less in summer.

Much has been argued about the separate existence of *cold*, from such facts as these: A piece of ice held before the thermo-electric pile produces an opposite deflection of the galvanometer to that produced by a hot ball. If a freezing mixture be placed at one focus of a spheroidal mirror, and a thermometer with a blackened bulb at the conjugate focus, the latter will fall speedily, though very far off from the mixture. Now, the true explanation of such observations is to be found in what is called the 'Theory of Exchanges,' first enunciated by Prévost, and since greatly extended and carefully verified by Stewart, which is to this effect: 'Every body is continually radiating heat in all directions, the amount radiated being greater as the temperature is higher.' Thus the radiation from a body depends on *itself* alone, the amount absorbed depends on the radiation which reaches it. Hence the apparent radiation of cold in the experiments above mentioned is due to the fact of the pile or thermometer *radiating off more heat than it receives*, as its temperature is higher than that of the freezing mixture to which it is opposed. From this it is evident that any number of bodies left near each other tend gradually to assume a common temperature. By this theory of exchanges we explain the cold felt in sitting opposite an open window in a frosty day, even when there is no draught.

Convection.—A hot body cools faster in a current of air than in a still atmosphere of the same temperature, evidently because fresh supplies of the colder air are continually brought into contact with it. This carrying off of its heat by a stream of air is an example of convection. It is by convection mainly that heat is conveyed throughout liquids and gases. Thus, when a lamp is applied to the bottom of a vessel of water the heat does not diffuse itself in the water as it would (by conduction) in a mass of metal, but the expansion of the heated water at the bottom rendering it lighter, bulk for bulk, than the superincumbent fluid, causes it to rise to the surface; and thus, by convection, the heat is diffused through the mass. Conduction, properly so called, can scarcely be shown, though it really exists, in liquids or gases, on this account. The tremulous appearance of any object as seen by light which passes near a hot surface, as that of a boiler or a red-hot poker, is due to the convection of heat in the air, the warm

current refracting light less than does the cold air. The sources of heat may be, so far as we know, ultimately reduced to two—chemical combination and mechanical energy; and, indeed, in all probability the former is only a variety of the immensely different forms in which the latter is manifested. A statement of the ultimate nature of the various sources of heat will be found in the article **ENERGY**.

See also for heat, its applications and their theory, the articles **AIR-ENGINE**, **COMBUSTION**, **FUEL**, **FURNACE**, **GAS** (LIGHTING AND HEATING BY), **INTERNAL-COMBUSTION ENGINE**, **INTERFERENCE**, **OVEN**, **POLARISATION**, **POTTERY**, **STEAM-ENGINE**, **STEAM-TURBINE**, **THERMODYNAMICS**, **ELECTRICITY** (for Thermo-electricity), **VENTILATION**, **WARMING**; Clerk-Maxwell's *Theory of Heat* (1875); Tyndall's *Heat as a Mode of Motion* (1880); Preston's *Theory of Heat* (3d ed. by Cotter, 1919).

Heath, Heather, two genera (*Erica* and *Calluna*) of small shrubs of the natural order Ericaceæ, distinguished by a calyx of four leaves, a bell-shaped or ovate—often ventricose—corolla, and a 4-celled, 4-8-valved capsule. The leaves are

Heaths.

small, linear, and evergreen. The genus *Erica* consists of about 400 species, besides innumerable hybrids and varieties raised in gardens. The home of the genus is in the western part of South Africa, but a few species are distributed over western and northern Europe. *Calluna vulgaris* (fig. 3) extends over central and northern Europe to the Arctic Circle, and occurs also in Labrador, Cape Breton, Nova Scotia, and parts of New England. It is the ling or heather of British moors and mountains. The genus *Erica* is not found in Asia, America, nor in Australia. Six heaths, not including the ling, are found in the British Isles.

Cross-leaved Heath (*E. tetralix*) (fig. 2) and Fine-leaved Heath (*E. cinerea*) (fig. 1) are common plants in most parts of Britain, and, like most of the genus, are very beautiful when in flower. The *heather-bells* of Scottish song are the flowers of one or both of these species. *E. carnea*, common in the southern parts of Europe, is a very frequent ornament of British flower-borders. Many species, remarkable for the size and beauty of their flowers, are much cultivated in greenhouses. Some of the South African or Cape heaths attain in their native region a much greater size than any European heath except *E. arborea*, which in the Pyrenees sometimes grows to the height of 20 feet. The latter is the

so-called Briar-root (q.v.) of which tobacco-pipes are made.

In the Highlands of Scotland the common heather served in former times a great variety of purposes. The poorer folks formed walls for their cottages with alternate layers of heather and a kind of mortar made of earth and straw, and they made comfortable if not luxurious beds of it, placing the roots downwards, and laying the plants in a sloping direction. With heather cottages are also thatched, besoms are made, and faggots are formed to burn in ovens. In the island of Islay ale was made by brewing one part of malt with two of the young tops of the common heather, and this liquor, according to Boece, was used by the Picts. Sheep and goats sometimes browse on the tender shoots, but they do not like them. The young tops are the food of grouse. From the flowers bees extract a great quantity of honey, which is of a very deep colour.

Heathfield, GEORGE AUGUSTUS ELIOTT, LORD, the heroic defender of Gibraltar, was the tenth son of Sir Gilbert Elliott, third Bart. of Stobs, and was born at Wells House in Roxburghshire, on Christmas-day 1717. Having been educated at the university of Leyden, and at the French military college of La Fère and at Woolwich, he had his first experience of actual warfare in the war of the Austrian succession, in which he was wounded at Dettingen and fought at Fontenoy. Having been gazetted colonel of a regiment of light horse in 1759, he served at its head with the English contingent that assisted Frederick the Great against Austria in the years 1759 to 1761. In the following year he went out to Cuba as second in command under the Earl of Albemarle, and returned home with the rank of lieutenant-general. When, after the outbreak of the war with the American colonies, Great Britain became involved in hostilities with Spain as well, Elliott was sent out to put Gibraltar in a state of defence. His obstinate and heroic defence of this stronghold, from June 1779 to February 1783, against all the power of Spain, ranks as one of the most memorable achievements of British arms (see **GIBRALTAR**). On his return home he was in 1787 raised to the peerage as Lord Heathfield, Baron of Gibraltar—Heathfield being a Sussex estate which he had purchased in 1763. He died at Aix-la-Chapelle, 6th July 1790. Drinkwater's *History of the Siege of Gibraltar* is one of the best accounts of military heroism ever written.

Heaven, in its theological sense, is that portion of the infinite space in which the Lord of all things, though present throughout all, is supposed to give more immediate manifestations of his glory. It is also the place, or the state or condition, of the blessed spirits, and of the souls of just men made perfect who are admitted into the participation or the contemplation of the divine beatitude. It is the special seat of the glory of the Most High, in which his angels minister to him, and the blessed spirits abide in perpetual praise and adoration. In the Scriptures the word is used in various senses: (1) for the region of the atmosphere; (2) sometimes for the region of the stars—the hosts of heaven; (3) as a state of blessedness attainable even here, as in Eph. ii. 6, where it is said 'God hath raised us up together (with Christ), and made us sit together in heavenly places;' and also in Phil. iii. 20, where the conversation of the saints while yet on earth is said to be 'in heaven;' (4) as the place where God dwells, where the angels and the spirits of the saints are congregated, whence Christ came and whither he has returned (John, xiv. 2, &c.). Many of the saints of Christendom in moments of ecstatic elevation of spirit have believed that glimpses into heaven have been vouchsafed to them, but their accounts of these

visions have usually been but incongruous and contradictory. The figurative language in which its unseen glories are described in Scripture has made such an excitation of fancy the more easy for devout souls rapt in profound meditation about what it has not been given to the eye of man to see nor the heart to conceive.

Aristotle declares that all men have a conception of gods, and that all agree in placing their habitation in the most elevated region of the universe. The Egyptian, the Scandinavian, the Assyrian, and all primitive religions maintain the existence of a heaven as the place of reward after death for virtuous lives lived on earth; and indeed it may be taken as the universal corollary to the universally held belief in the immortality of the soul, even though it may be only under the form of the final stage in a cycle of purificatory transmigrations. But among primitive peoples it is little more than a dim and shadowy continuation of this present world, the pale ghosts that inhabit it wearing the form and fashion that they wore in life. The idea of future retribution enters early into the moral consciousness of man, but it would hardly be true to say that it is everywhere present. The Teutonic warrior had his war-horse and his armour laid in his barrow that he might continue into the spirit-world the joys of life, his Valhalla being but a glorified extension of the warrior's life, just as the Red Indian's paradise is but a richer and more extensive hunting-ground. Yet the unseen life is often but poor and cheerless compared with the warm and actual world—even in the Elysian fields the shade of Achilles would gladly change places with the meanest soldier in the Grecian host.

The Koran adopts the Cabbalistic notion of seven heavens, which rise above each other like the stages of a building; and it places the chief happiness of heaven in the unrestricted and inexhaustible joys of sense. The Cabbalistic writers divide these seven heavens according to the successive degrees of glory which they imply. The seventh is the abode of God and of the highest order of angels; the sixth, fifth, fourth, and third are the successive abodes of the various grades of angels, arranged according to the degrees of dignity. The second is the region of the clouds, and the first the space between the clouds and the earth.

For the development of Jewish and Christian Eschatology, and the significance of the conception of heaven, see the article *HELL*, under which the subject of future rewards and punishments is discussed with some fullness.

Hebbel, FRIEDRICH, lyrical and dramatic poet, was born at Wesselburen, in Dittmarsh, 18th March 1813. After travelling in Germany, France, and Italy, he settled at Vienna in 1846, where he married the actress Christine Enghaus. He died at Vienna, 13th December 1863. His principal works are his *Gedichte* (2 vols. 1841–48), and several dramas, the best among them being *Judith* (1840), *Maria Magdalena* (1844), *Agnes Bernauer* (1855), *Pygus und sein Ring* (1856), and his masterpiece, *Die Nibelungen* (1862). Hebbel had strong dramatic talent, skill in drawing character, and command of vigorous language, but no feeling for beauty. His dramas are destitute of love and joyousness; they depict the revolt of passionate natures, the frenzied riot of evil desires, and are characterised by an almost daemonic vigour of action. His collected works were edited by R. M. Werner in 1911–13. See Biographies by Kuh (2d ed. 1907), Frankl (1884), Bartels (1899), and Werner (1905), Hebbel's own *Tagebücher* (2 vols. 1887) and *Briefe* (1908), and T. M. Campbell's *Life and Works of Hebbel* (Boston, 1919).

Hebe, the goddess of youth, the daughter of Zeus and Hera, was the wife of Herakles after

he had been deified. She was the cupbearer in Olympus before Zeus conferred that office upon Ganymede; but she always retained the power of restoring the aged to the bloom of youth and beauty. According to Apollodorus, she became the mother of two sons by Herakles—Alexiares and Aniketos. In Homer she always appears as a virgin. In Athens altars were erected to her conjointly with Herakles. In Rome she was worshipped under the name of Juventas, and a temple in her honour existed on the Capitoline Hill at the time of Servius Tullius. Statues of Hebe are extremely rare; she is to be recognised only by the nectar-cup. Canova's masterpiece is known to all.

Heber, REGINALD, third Bishop of Calcutta, was born at Malpas, Cheshire, 21st April 1783. It was as a student of Brasenose College, Oxford, that he produced his prize poem *Palestine* (1803), perhaps the only prize poem which holds a place in English literature. In 1807 he was inducted into the family-living at Hodnet, in Shropshire. Tory and High Churchman, he was a frequent contributor to the *Quarterly Review*; his first hymns appeared in 1811 in the *Christian Observer*, and in 1812 he published a volume of poems. He became Bampton lecturer in 1815, prebendary of St Asaph in 1817, and in 1822 preacher of Lincoln's Inn. In the following January he accepted the see of Calcutta. The apostolic zeal with which he conducted his episcopacy was suddenly terminated by his death, of apoplexy, at Trichinopoly, on 3d April 1826. He was a voluminous writer, and published sermons, *A Journey through India, &c.*, and he edited Jeremy Taylor's *Works* (1822). As a poet, his fame rests upon *Palestine* and his *Hymns* (new ed. 1878), which include such well-known favourites as 'Lord of Mercy and of Might,' 'From Greenland's Icy Mountains,' 'Holy, Holy, Holy, Lord God Almighty!' 'The Son of God goes forth to War,' &c. See Lives by his widow (1830) and G. Smith (1895).—RICHARD HEBER, his half-brother, was born in Westminster in 1774, and died in 1833. He was a famous bibliomaniac. Dibdin estimated his collection in England at 105,000 vols., in addition to which he possessed many thousands of books on the Continent, the whole having cost him £180,000.

Hébert, JACQUES RENÉ, commonly known as *Père Duchesne*, one of the most despicable characters of the French Revolution, was born at Alençon, in 1755. At an early age he went to Paris as a servant, but was dismissed from more than one situation for embezzling money. Soon after the commencement of the Revolution he became one of the most prominent members of the extreme Jacobins; and when this group established *Le Père Duchesne* newspaper, for the purpose of crushing the constitutional paper edited by Lemaire and bearing the same title, Hébert was made editor of it. And he conducted his paper with such reckless ribaldry as to make himself a darling of the mob. In consequence of the events of the 10th August he became a member of the revolutionary council, and played a conspicuous part in the massacres of September. He was one of the commission appointed to examine Marie Antoinette, and his name will survive in unending infamy for one foul and baseless charge he brought against her. He and his associates, called Hébertists or *Enragés*, were mainly instrumental in converting the church of Notre Dame into a temple of Reason. But he went too fast for Robespierre, who got rid of him through the guillotine, 24th March 1794. His whining cowardice on the scaffold earned him the jeers and insults of the fickle mob.

Hebrew Language. The word Hebrew (*‘ibrit*) is an adjective, formed, according to the Old Testament, from Heber (*‘ēber*), a descendant of Shem (Gen. x. 22–24), who was the ancestor of Abraham (Gen. xi. 12–26). The Septuagint, however, already renders Gen. xiv. 13, ‘Abraham the crosser’ (i.e. of ‘the river,’ though Origen explains the name from ‘crossing’ Mesopotamia towards Canaan), and Aquila translates ‘the dweller on the other side,’ probably of the Euphrates, though it might be the Jordan. The word ‘Hebrew’ is used both of individuals and the people when antithesis to other nationalities is expressed (Jon. i. 9; Phil. iii. 5; Gen. xxxix. 14; xl. 15; Exod. i. 16; ii. 6, &c.), ‘Israel’ being more a domestic name, often having religious significance. As a national name, Israel belonged specially to the northern kingdom, of which it is used freely in the Moabite Inscription (e.g. lines 5, 11, 14).

The phrase ‘Hebrew language’ does not occur in the Old Testament. In the earliest reference to the speech (Isa. xix. 18) it is called the ‘language of Canaan,’ and in another passage, referring to events of the same period, ‘Judean’ or Jewish (2 Kings, xviii. 26, 28; Isa. xxxvi. 11, 13; cf. Neh. xiii. 24). This passage is interesting as showing the linguistic attainments of the Assyrian officials and others of this age. The Rabshakeh could speak Hebrew, and Hezekiah’s officers understood Aramaic, which appears to have been the language of diplomacy and commerce at this time, a position to which it would naturally attain, from the fact that the Aramean peoples lay along the great trade routes between east and west. The name ‘Hebrew’ is first used of the language of the Old Testament in the prologue to Ecclesiasticus (c. 130 B.C.), and then in the New Testament (Rev. ix. 11). After the dissolution of the Jewish state Aramaic more and more made encroachment in Palestine, Dan. ii. 4–vii. 28, Ezra, iv. 8–vi. 18, and Jer. x. 11 being written in that dialect, to which also belong the words *Jegar-Sahadutha*, ‘heap of witness’ (Gen. xxxi. 47). Gradually it superseded Hebrew as the spoken language, and, though mixed with elements of Hebrew, was the dialect in use in the time of Christ, as it had been for a long time previously. All the words reported as spoken by him (such as *talitha kumi* or *koum*, *lemá shebaktáni*) are Aramaic. The name Hebrew was thus given to two languages, the ancient Hebrew, and the more modern Aramaic in actual use, though chiefly to the latter (John v. 2): ‘their proper tongue,’ to which Akeldama belongs (Acts, i. 19), is Aramaic. Which of the two languages is meant, Acts, xxi. 40, xxii. 2, xxvi. 14, may be doubtful.

The Hebrew language is one of the Semitic family of speeches (see SEMITES). Hebrew shares with its sister-languages these and other peculiarities: roots with three consonants; vowels having no significance as stem-sounds; two verbal forms for the expression of tense; two genders; the attachment of the oblique cases of personal pronouns to nouns and verbs in the form of suffixes; an inability, except in proper names, to form compounds, whether verbal or nominal; and a syntax distinguished by simple co-ordination of clauses by means of *and*, where other languages subordinate with a multiplicity of conjunctions. At a remote period we must suppose primitive Semitic spoken by a united, homogeneous people, which afterwards separated in various directions, each section retaining and developing some of the originally common elements of the tongue, until gradually, under many influences of climate and conditions of life, the great dialects acquired distinctness from one another. In this way some primitive elements

would be retained by one family and others by another, while each would move along new lines of development, due to its idiosyncracies and circumstances, as Hebrew, for example, expresses ‘west’ by ‘sea.’ Even in the earliest form in which we observe Hebrew it shows marks of linguistic decadence. It has almost entirely renounced nominal case-endings; given up the use of the dual, except in a few nouns; is in process of substituting the reflexive for the passive (a process completed in Aramaic and Ethiopic); and has lost the consciousness of the strict sense of its elementary moods. In short, literary Hebrew is already nearly at the same level as vulgar Arabic, as distinguished from inflected Arabic, or as modern English is compared with Anglo-Saxon. On the other hand it has some peculiar excellences, as the greater freedom in regard to the place of words in the sentence, and the singular tense usage known as *var conversive*, of which, however, it is now known to have no monopoly, but to share it with the language of Moab.

Beyond differences of pronunciation and usages peculiar to separate localities, ‘dialects’ can hardly have existed in Hebrew. In the north a shorter form of the relative appears, *she* or *sha* (Ass. *sha*)—e.g. Judges, v. 7. This is common in the Canticles (of disputed date), and in later books, as Ecclesiastes, and usual in post-biblical Hebrew. The Ephraimites appear to have shared the usual Semitic tendency to confuse *sh* and *s* (Judges, xii. 6); and in the south Amos (vi. 8; viii. 8) shows another common failing, that of confusing the gutturals, a thing said to have gone to an extreme in Galilee in the age of Christ, and abundantly exemplified in Assyrian. So far as the literature of the language is concerned, only two periods can be distinguished: (1) from the earliest times to the restoration from exile (538), and (2) from the restoration to our era (see BIBLE). It is true that writers on the borders of the exile, such as Jeremiah and Ezekiel, show a tendency to employ Aramaic words and forms; but, on the other hand, writings of the exile period, as Isa. xl.–lxvi. and much else, are splendid examples of Hebrew composition. The restored community in Judah would of course still speak and write Hebrew. In the north of the country, however, the policy of Assyria had long ago settled a number of colonists, speaking mainly Aramaic. When Palestine came under the influence of the Syro-Greek kingdom the Aramaic pressure would become greater. And thus gradually Hebrew receded before the Aramaic, until by the time of the Maccabees, or considerably earlier, the latter had become the spoken language. Among the learned, however, the ancient tongue was still cultivated and written, though naturally not in its ancient purity, nor without many new developments. These new elements are of several kinds: first, nominal and verbal forms, partly absolutely novel, but mostly a great extension of forms occurring rarely in the classical language; and secondly, a considerably altered vocabulary, drawn partly perhaps from a lower stratum of popular speech than that touched by the biblical writers, but greatly from the Aramaic. Examples of this new literary, though degenerate, Hebrew may be seen in its earliest form in Ecclesiastes, and in a much more advanced condition in the Mishna (c. 200 A.D.).

The character in which Hebrew was written was the ancient Semitic alphabet, common over much of the East (see ALPHABET). The oldest and most beautiful example of this character is the Moabite Inscription (c. 900 B.C.; see MOAB); a somewhat ruder form appears in the inscription from the Siloam tunnel, probably of the age of Ahaz or Hezekiah (see JERUSALEM). The latter was

executed at their own hand by the workmen who cut the tunnel, and is naturally less artistic, though extremely interesting, as showing how extended the art of writing was at so early a time (Isa. x. 19). In the Moabite monument the same letter appears in several forms, which suggests either great practice on the part of the sculptor, or else that he faithfully copied a model supplied him by the pen, in this case a facile one. The character appears in a bigger, more robust form in the Phœnician inscriptions—e.g. of Eshmunazar. Somewhat modified it is Samaritan; in south Arabia it is Himyaritic or Sabeian; and from there it passed to Abyssinia, and is Ethiopic. The Syriac and Arabic are the same letter in cursive forms. The Aramean influence on southern Palestine introduced not only its dialect but also its script. The present Hebrew square character is in a somewhat ornamental shape—a cursive form of the ancient alphabet adopted by the Arameans; the article ALPHABET shows both the Phœnician and the later square Hebrew character. The monuments show this Aramean cursive in various forms of development. Jewish tradition ascribes its introduction to Ezra, a tradition which expresses merely the facts that a change took place in the letter employed, and that this change was posterior to the return from exile. The use of the letter no doubt crept in gradually, just as the use of the Aramaic dialect did. The ancient letter is still seen on coins of the later Maccabean princes. Some deviations of the Septuagint from our present Hebrew text seem explainable from the supposition that their MSS. were written in the ancient character; while, on the other hand, some discrepancies rather suggest MSS. in the square letter. The words of Christ, 'one jot or tittle,' have been thought to show that the square character, in which *y* (י or *yod*) is much the smallest letter of the alphabet, had long been in use.

The history of the language would not be complete without one or two additional facts. (1) In Semitic languages the consonants alone are usually written. Of course, no language could be spoken, and no writing read without vowel-sounds, but no signs for these sounds existed. Certain weak consonants, however—viz. *h*, *w*, *y*, were early used to indicate the place of long vowels, particularly at the end of words, and also of diphthongal sounds (*ai* = *ē*, *au* = *ō*) in the middle of words. Already in the Moabite stone final vowels are so marked, and occasionally diphthongs within words. Phœnician, on the contrary, uses such signs very little. Ancient Hebrew agreed with Moabite in its practice, as appears from the Siloam inscription. The use of these so-called vowel-letters was probably scanty and fluctuating in early times, but became more regular afterwards. Unfortunately, we have no guarantee that transcribers were careful to preserve the antique spelling. Our present text is too uniform to be supposed to have preserved the varieties of different ages, and it is evident that the MSS. of the Septuagint translators in a multitude of cases were without the medial vowels, and in some cases without the final vowels, now present in the Hebrew text. In the end of the 1st or early in the 2d century a standard text was adopted, and modernising of the spelling in the main ceased. Peculiarities were henceforth registered, not effaced. This period during which the consonantal text was treated extends to the era of the Talmud (c. 500 A.D.). During its course a multitude of works were produced—e.g. *Midrashim*, or homiletical expositions, especially of the books of the Pentateuch; the Mishna (200 A.D.), a code of traditional law; and the tracts composing the Talmud, which are commentaries on the Mishnaic law, but containing much haggadic or edifying matter. (2) Neither Jerome

(d. 420) nor the Talmud knows anything but the consonantal text. The example of Syrian scholars and necessity led, however, to the invention of a very complete system of external signs for the vowel-sounds of the language. This is the Masoretic system of points, now printed in our Bibles. Its authors are unknown, and also the age at which it was completed. Minute as it is, it can make little pretension to represent the pronunciation of the ancient living language. The pronunciation of a language during a period of nearly a thousand years in disuse must have undergone changes; the Septuagint pronounces in many cases differently from the present text; and, in point of fact, the vocalisation represents not the pronunciation of a spoken language, but that of the solemn intoned reading in the service of the synagogue.

About the 10th century a new impulse was given to the study of Hebrew by the example of the Arabic grammarians. The interest of the latter was to begin with a purely religious one—i.e. to explain the Koran. Even the earliest collections of poetry had this religious object. The poetry of the desert was accepted as the purest Arabic, and it was collected and studied with the view of illustrating the syntax of the Koran. By-and-by grammar came to be cultivated for its own sake, and the ancient poetry studied for the sake of its intrinsic charms. In emulation of their Arabic confrères, a school of Hebrew grammarians arose, to which belong such names as Sa'dia of the Fayyum, Chayyuj (1000), Abu'l-Walid Merwan ibn Janach, Abenezra (d. 1167), Dav. Kimchi (d. 1235). Where Arabic was not used a neo-Hebraic language was employed by these scholars, greatly a return to biblical Hebrew, and in this many commentaries were composed, as by Abenezra, Kimchi, and Rashi of Troyes (d. 1105). At the revival of letters Christian scholars became apt pupils of the Jews—e.g. John Reuchlin (d. 1522). In the next century the chief seat of Hebrew learning was Switzerland, where flourished Buxtorf the Elder (d. 1629); and in the century following Holland, the most famous representative of the Dutch school being Alb. Schultens. In the 19th century the most distinguished promoters of Hebrew learning were Gesenius of Halle and Ewald of Göttingen.

MODERN HEBREW.—A few observations may be added, in conclusion, on the use of Hebrew as a spoken and written language among modern Jews. Hebrew has continued down to the present day as the language of the synagogue. Except in the Reform communities of Germany and America, public and even private worship is almost entirely conducted in 'the sacred tongue.' Although the majority of western Jews, particularly among the upper and middle classes, possess but an imperfect acquaintance with it, the authorities manifest a strong disinclination to cease praying in a language which, it is urged, constitutes a powerful link between Israel's present and past, and serves as a bond of union between Jews all the world over. Outside the synagogue, Hebrew can scarcely be said to have survived as a *spoken* language, except that in Jerusalem and other eastern cities it forms a sort of *Lingua Franca* among the Jews of various nationalities settled there. As a *written* and *printed* language, however, the employment of Hebrew is far more general. It serves as a universal medium of correspondence, both private and official, among Jews in various parts of the world, and particularly between the East and the West. Various weekly journals are also written in it, in Europe as well as in Palestine. Added to this, numerous Hebrew works on all subjects continue to be composed by learned Jews. The Hebrew thus used for modern purposes is usually not the pure Hebrew of the Bible and synagogue, but the

rabbinical dialect in which Jewish doctors of the law have studied and commented, written and disputed since the age of the Mishna, and which has been developed and amplified by Jewish philosophers, poets, and grammarians throughout the middle ages. Both kinds of Hebrew—biblical and rabbinical—must be carefully distinguished from the *patois* dialects affected by Jews in countries where they have not yet been fully emancipated or modernised. In Central Europe they speak a jargon composed of old German and Hebrew, called *Judisch-Deutsch* (Yiddish), while in parts of the East a Judæo-Spanish dialect flourishes by its side. The pronunciation of Hebrew differs among the two geographical sections into which Jews are divided, and which are known as *Ashkenazim* or 'Germans,' and *Sephardim* or 'Portuguese,' the former being of German and Polish origin, and the latter having migrated from the south of Europe or being still distributed there. Probably the 'Portuguese' mode of reading originally came from Palestine, where the vocalisation and pronunciation of Hebrew were fixed by the Massorites of Tiberias.

See JEWS and works there mentioned; SEMITES; Gesenius, *Gesch. der hebr. Sprache* (1815); his grammar and lexicon; and A. B. Davidson, *Introductory Hebrew Grammar*; histories of Jewish literature by Steinschneider (1857), Winter and Wunsche (1895), Abrahams (London, 1906); and for modern developments, *The Renaissance of Jewish Literature*, by Slowicz (Phila. 1909), *Thesaurus Totius Hebraicitatis*, by Eliezer ben Jehuda (1911-14).

Hebrews, THE EPISTLE TO THE, is one of the most important documents in the New Testament. It was written to meet the moral and intellectual difficulties which arose among the Christians of the second generation. (1) In the second generation the tendency to relapse, especially under stress of persecution, was much more marked than in earlier times. Numbers of Christians in this generation were the children of the earlier converts. They had come by their religion easily. There had been no violent wrench in their case, and they can scarcely be described as belonging to the ranks of 'the twice-born.' Hence when the time of testing came, as it did in the persecution of Domitian's reign, many of them were not prepared to pay the price which loyalty to the faith involved. The epistle is full of warnings and exhortations in the presence of this danger. The writer praises unstintedly those who had endured persecution and the spoiling of their goods (x. 32), and those who had suffered imprisonment rather than deny their Lord (xvi. 3, x. 34), but he utters the most terrible warnings against those who had lost their old enthusiasm and were wavering in their faith and in danger of relapsing from Christianity (ii. 1-3, iii. 12, vi. 4, x. 25-29), pointing out that it was impossible for renegades to be readmitted to the benefits of the Christian faith (vi. 4-8, x. 26-31). (2) In the second generation, too, intellectual difficulties began to arise. Men began to ask questions. One of the problems which was most acutely felt was the question of the relationship of the Christian faith to the revelation in the Old Testament. To the devout Jew the Old Testament was the record of the full and complete revelation of God. If Christianity was at variance with that revelation, it was false; if it was in agreement with it, it was superfluous. It is this problem that the Epistle to the Hebrews set itself to face. It boldly asserts that the Old Testament revelation was fragmentary and inadequate, and needed to be supplemented by the higher and more perfect revelation which had been given to the world in Christianity. The writer tries to prove his case (1) by showing that Christ was greater than the angels, through the medium of whom the law was given

to the world (chap. i.), greater than Moses, who was only a servant, while Christ was the Son of God (chap. iii.), greater than Aaron, because he was a high priest after the order of Melchizedek (chap. v.); (2) by showing that the institutions and ritual of the Jewish law were ineffective and failed to achieve the purpose for which they existed—the removal of human sin (chaps. ix.-x.).

The nerve of the argument seems at first sight to be Jewish, and to rest upon a particular method of interpreting the Old Testament. But though the process of the argument seems to move entirely within the circle of Jewish ideas, when we come to look beneath the surface of the text we find that as a matter of fact it is really based upon the principles of the Platonic philosophy. According to the teaching of Plato, all earthly phenomena are only the phantoms and shadows of realities that exist in the heavens. Applying this principle to the Old Testament, the writer argues that the institutions of the law were only the copies and shadows of the heavenly realities (viii. 5, ix. 23, x. 1), whereas in Christianity the realities themselves had come down from heaven to earth. The Epistle to the Hebrews is the first attempt to utilise the Platonic philosophy as a weapon of Christian apologetics.

There are many critical problems connected with the epistle, some of which seem incapable of solution. 1. *The title* raises the first difficulty. The epistle is addressed 'To Hebrews'—though probably these words were not found in the original autograph of the epistle. To suppose that the epistle was intended for Jewish Christians in general is, however, impossible in view of the many local and personal references which it contains. Most modern scholars are agreed, therefore, that the epistle was addressed to a special Jewish community, though there is the greatest diversity of opinion as to the city in which this Jewish community lived. The older scholars used to maintain that Palestine, and Jerusalem in particular, was the original destination of the epistle, and this view has been strongly advocated by Westcott in modern times. The chief grounds upon which this theory rests are (1) the Jewish tone of the epistle, (2) the frequent reference to the temple institutions and ritual. The type of thought, however, evinced in the epistle is entirely foreign to Palestinian Judaism, and there is no place in the whole world where its main argument would have been so little understood. The choice to-day seems to rest between Alexandria and Rome, with the balance of opinion, perhaps, in favour of the latter alternative. The theory that Rome was the original destination of the epistle helps to explain certain things which, on any other hypothesis, are difficult: (a) the fact that the epistle was known to and used by Clement of Rome as early as 95; (b) the salutation which the writer sends in xiii. 24, from 'those of Italy'—who seem to have been Italian friends of the readers; (c) the reference to the persecutions in x. 33, 34, which seems to be in harmony with our knowledge of the Neronian persecution, though it might equally well suit the later situation in the time of Domitian. As an additional point in favour of the Roman theory, it may be mentioned that Schürer has demonstrated from the inscriptions that Jews in Rome were called Hebrews, and the probability is that this title would be retained by them after their conversion to Christianity.

2. *The literary character of the book.* The document has always been regarded as an epistle, though as a matter of fact all the usual characteristics of a letter are absent from it till we reach chap. xiii. The opening verses, contrary to the usual practice, afford us no hint whatever that the

book is intended to be an epistle. The names of the author and the recipients, which are always the first points to be mentioned in an ancient letter, are entirely omitted, and it is only in the final paragraphs that any statements are made which compel us to regard the book as an epistle at all. A theory has been recently put forward that the body of the book was originally a homily or a series of homilies to which the latter part of chap. xiii. was added as a kind of covering letter when the writer despatched it to its destination.

3. *The question of authorship* is one of the most perplexing problems connected with New Testament criticism. Origen confessed that the problem completely baffled him. 'Who wrote the Epistle to the Hebrews,' he says, 'God only knows,' and we need not be surprised, therefore, at our own inability to solve the difficulty. The traditional view that the epistle was written by the Apostle Paul has now been completely abandoned. The differences in style, method of argument, form of quotation, and theological outlook are so pronounced that they make it inconceivable that Hebrews was written by the Apostle Paul. Three other names were mentioned by the ancient Fathers. Hebrews was definitely ascribed to Barnabas by Tertullian and by the author of the recently discovered *Tractatus Originis*. Clement of Alexandria and Origen regarded Luke as a possibility, and Origen states that some people in his day attributed the epistle to Clement of Rome. Luke and Clement, however, are both of them out of the question. The character of their known writings puts them out of court at once. Barnabas is much more likely. He was a Levite, and so interested in the temple and its ritual; a companion of St Paul, and so able to write with apostolic authority; interested, too, in the questions with which Hebrews deals, as his own epistle shows. There are two grounds, however, for hesitation. We have no real evidence that Barnabas was sufficiently versed in Platonism to produce the sustained argument that underlies the Epistle to the Hebrews. Moreover, some of his detailed descriptions of the tabernacle and its ritual appear to be mistaken (though some of these apparent mistakes are repeated in Philo and Jewish apocalyptic literature), and do not seem to be natural in one who belonged to a Levitical family and might therefore be presumed to be fully acquainted with the facts.

In modern times many other names have been suggested. Luther, for instance, put in a claim for Apollos. And judging from what we are told about Apollos in Acts and 1 Corinthians, he is, as Bruce remarks, 'just the kind of man that is wanted.' He was a friend of the Apostle Paul, deeply versed in Alexandrian philosophy, and a devotee of the allegorical method of exegesis. It is impossible to deny that he might have written the Epistle to the Hebrews, but it is equally quite impossible to prove that he did write it. One of the latest modern theories, which has been strongly advocated by Rendel Harris, Harnack, and Peake, maintains that the epistle was written by Priscilla. This hypothesis, it is urged, explains the character of the opening chapter. Priscilla, being a woman, did not dare to put her name at the commencement of the letter, lest if it were known that the epistle was written by a woman the value of its argument might be impaired. The theory is very ingenious, but it lacks solid foundation, and it is quite impossible to demonstrate, to say nothing of the fact that in xi. 32 (the only place in the epistle where the writer makes the slightest self-allusion) the masculine participle is used. Of course it is conceivable that Priscilla may have written that masculine participle to conceal her

identity; but, on the other hand, such a supposition is hardly convincing, as the sentence might have been written in so many other ways and the use of the participle avoided altogether. On the whole, therefore, it may be said that unless we are prepared, on the authority of Tertullian and another early writer, to accept Barnabas as the author of Hebrews, we are left in the same uncertainty which Origen felt in the first quarter of the 3d century, and we are driven to confess that in the light of our present knowledge the problem is absolutely insoluble.

The best modern Commentaries are those of Westcott; Peake (*Century Bible*); A. B. Davidson, Nairne, Dods (*Expositor's Greek Testament*); E. F. Scott (*Peake's Commentary*); Edwards (*Expositor's Bible*), Rendall. For discussion of the critical problems see the New Testament Introductions of Moffatt, Jülicher, Peake, Adeney, and Bennett. For the theology of the epistle, see Bruce, *The Epistle to the Hebrews*; Nairne, *The Epistle to the Priesthood*; MacNeill, *The Christology of the Epistle to the Hebrews*; Ménégot, *La Théologie de l'Épître aux Hébreux*; Dale, *The Jewish Temple and the Christian Church*; Riehm, *Der Lehrbegriff des Hebräerbriefes*; E. F. Scott, *The Epistle to the Hebrews*.

Hebrews, GOSPEL OF THE. See APOCRYPHA.

Hebrides, or **WESTERN ISLANDS**, the name applied in a general sense to all the islands on the west coast of Scotland. To the Outer Hebrides, the geological substratum of which is almost exclusively gneiss, belong Lewis with Harris (Long Island), North Uist, Benbecula, South Uist, Barra, and the remote group of St Kilda, 60 miles to the west. The principal of the Inner Islands, composed chiefly of trap and slate, are Skye, Eigg, Coll, Tiree, Mull, Iona, Staffa, Ulva, Lismore, Kerrera, Colonsay, Oronsay, Jura, and Islay. Bute, the Cumbraes, and Arran, are usually counted amongst the Hebrides; and to the same group were anciently assigned the peninsula of Kintyre, the island of Rathlin, and the Isle of Man. Of a total of about 500 islands (other than rocks) only one-fifth are inhabited. Of the whole surface only about 200,000 acres are arable; the rest is pasture-land of little value, morasses, peat-mosses, lakes, and barren sands and rocks. Owing to the influence of the Gulf Stream, the Hebrides have a mild though humid climate. Politically the Hebridean isles are distributed among the Scottish counties of Ross, Inverness, Argyll, and Bute. The Inverness and Ross islands were made a separate constituency in 1918. The humbler class of natives for the most part speak Gaelic. The people are much occupied in fishing and fowling (see CROFTER), and tweeds and other woollens are manufactured. A large proportion of the area has been converted into sheep-walks, whilst extensive tracts are let to sportsmen.

The Hebrides are the *Hebūdæ* of Ptolemy and Pliny's *Hebūdæ* (of which 'Hebrides' is a corruption, due originally to a misprint), and *Sudreygar* (Southern Islands) of the Norwegians. This last name was Latinised as *Sodorenses*, which survives in the title 'Bishop of Sodor and Man.' The early Celtic inhabitants were converted to Christianity by St Columba in the 6th century. Some three centuries later several of the islands were colonised by Norwegians, who came hither to escape the iron rule of Harold Haarfager (q.v.). But in consequence of the severe depredations which these sea-rovers afterwards committed on the coast of Norway, Harold sent an expedition westwards, which subdued all the Western Islands as far south as Man. To Norway they remained subject till 1266, when they were transferred to Scotland. From that time the islands were governed by native chiefs, until in 1246 the head of the Macdonalds reduced the whole under his

authority, and took the title of Lord of the Isles (q.v.). But from the beginning of the 16th century they were gradually annexed to the Scottish crown. In the 19th century the Hebrides became widely known through Scott's poem *The Lord of the Isles* and Mr William Black's charming novels.

C. Mackenzie's *History of the Outer Hebrides* (1903); Mrs Kennedy-Fraser's *Songs of the Hebrides* (1909-17-21).

Hebrides, New. See NEW HEBRIDES.

Hebron, one of the oldest cities in Palestine, belonging to the tribe of Judah, 21 miles SSW. of Jerusalem. It was anciently called Kirjath-arba, and at a later period was the seven years' residence of King David before he conquered Jerusalem. The modern town, El Khalil ('the friend'—of God, Abraham), is a poor place, inhabited by some 16,000 people. It lies low down in a narrow and picturesque valley—the Valley of Eshcol, famous now, as of old, for its thick clustering grapes, its olives, and other fruits. The church erected by the Empress Helena, the mother of Constantine, on the spot where Abraham is said to have been buried, has been converted into a mosque called *El-Haram* ('sanctuary'), built to enclose the cave which is the traditional burial-place of Abraham, Isaac, and Jacob and their wives. See Vincent and Mackay, *Hebron, Le Haram el Khalil*.

Hebrus, ancient name of the river Maritza (q.v.).

Hecataeus of Miletus, an early Greek historian and geographer, usually styled 'the logographer,' flourished most probably about 500 B.C. He seems to have visited Greece, Thrace, the countries bordering on the Euxine, and many of the provinces of the Persian empire, with parts of Italy, Spain, and Africa, and the results of his observations were given in two great works—his *Tour of the World*, and his *Histories* or *Genealogies*; the latter, however, is little more than a prose version of the poetical legends of the Greeks. Only fragments now remain, which have been edited by Creuzer, Klausen, and Müller. At the revolt of the Ionians against Persia he dissuaded its ring-leader, Aristagoras, from an attempt so far above the means of his countrymen; and when that counsel was despised, urged the formation of a fleet, but in vain. Hecataeus afterwards went as ambassador to the Persian satrap Artaphernes, and induced him to treat the Ionians with leniency.

Hecaté, a mysterious goddess who was apparently unknown to the Greeks of Homeric times and may be of oriental origin. She makes her first appearance in Hesiod as a goddess having power over earth, heaven, and sea. This triple power may perhaps give the clue to the fact that in art she is occasionally represented as a triple figure. It also explains the fact that ultimately, and especially in Orphic literature, she came to be identified with many other goddesses, such as Artemis, Eileithyia, Selene, Iris, Persephone, Aphrodite, Gaia, Hestia, Isis, Physis, and the Bona Dea. Owing to the extent of her domain she was especially able to grant the wishes of her votaries and to give them the fulfilment of their desire in battle, in athletic and other contests, in the popular assembly, and in the law-courts. But her power was above all displayed in the matter of ghosts and bogeys; she was able not only to ward off the visits of such hags but also to send them. Indeed, besides sending an Empusa or an Antæa, she also herself appeared as a bogey, with torch and sword, and snakes for hair; or she might appear as a dog, a mare, a lioness, or a cow. As her appearance was the sign for dogs to bark, so she was supposed

to be accompanied by a train of Stygian dogs. The origin of this figure is uncertain; she is claimed as a moon goddess, and her name is interpreted in accordance with this view as indicating the action of light at a distance. It makes against this theory, however, that the lunar functions of Hecate are not mentioned by any author earlier than Sophocles, and that they do not become prominent in her worship until post-classical times, and then only 'in the systems of the later mythologists' (see *Class. Rev.* June 1888). Her intimate connection with the spirits of the dead would rather point to her having originally been a goddess of the nether world, for the earth is regarded as the abode of the spirits of the departed. This would explain her connection with the mysteries, and the propitiatory offerings made to her in atonement for sin. Finally, the unsatisfactory explanation of her name just given is by some set aside, as too abstract, in favour of the interpretation of the name as meaning 'dog' (Hecate: Ger. *hund*: Eng. *hound*: Gr. *hekaton*: *Hund*-red. See *Class. Rev.* Nov. 1889). This harmonises with various points in the ritual of Hecate; dogs were offered to her at cross-ways (which are favourite haunts for ghosts), she herself is termed fond of dogs, and sometimes appeared leading Cerberus.

Hecatomb, in the worship of the Greeks, and in other ancient religions, a sacrifice of a large number of victims, properly, although by no means necessarily, one hundred. As early as the time of Homer it was usual only to burn the legs wrapped up in the fat and certain parts of the intestines, the rest of the victim being eaten at the festive meal after the sacrifice. In Athens the hecatomb was a most popular form of sacrifice; while the thrifty Spartans on the contrary limited the number both of the victims and of the sacrifices. In the hecatomb, strictly so called, the sacrifice was supposed to consist of one hundred bulls; but other animals were frequently substituted.

Hecker, FRIEDRICH KARL FRANZ (1811-81), born at Eichersheim in Baden, abandoned his profession of law for political life, joining the democratic and socialistic party. At the revolution in 1848, failing to convert the preliminary convention into a permanent republican assembly, he put himself at the head of a band of revolutionists, and invaded Baden from the south, but was defeated and fled to Switzerland. Next year he settled in America as a farmer near Belleville, in Illinois. In the civil war he raised a regiment of Germans, and for a time commanded a brigade.

Hecker, ISAAC THOMAS (1819-88), the son of New York Germans, passed from Brook Farm socialism to Behmenite mysticism, and became a Catholic (1844) and, after studies in England, a Redemptorist Father. Claiming unwonted freedom, he was extruded from that order, but founded 'the Missionary Priests of St Paul,' and greatly extended Catholicism in America. His 'Americanism' or tendency to democratise Catholicism created much controversy, and was disapproved by the Roman Curia. See his *The Church and the Age* (1888), and *Life* by Elliott (1898).

Hecker, JUSTUS FRIEDRICH KARL (1795-1850), professor of Medicine at Berlin, wrote a famous history of medicine (1829), books on the Black Death, &c., and his great work, the *Epidemics of the Middle Ages* (translated for the Sydenham Society in 1846).

Heckles, or **HACKLES**, very important parts of various kinds of machines employed in the preparation of animal and vegetable fibres for spinning, consist of a series of long metallic teeth, through which the material is drawn, so that the fibres may be combed out straight and so fitted for the subse-

quent operations. Gills are heckles with finer teeth (see SPINNING).—*Heckling* is also now the received term (first used in Scotland) for the rough and trying process of catechisation to which parliamentary candidates and members are subjected by their constituencies.

Heckmondwike, an urban district in the West Riding of Yorkshire, 8 miles N.E. of Huddersfield. It is the chief seat of the carpet and blanket manufactures in the West Riding, and also makes rugs, pilot-cloth, and flushings. There are ironworks, machine-shops, and coal-mines in the neighbourhood. Here was born John Curwen, the inventor of the Tonic Sol-fa system. Pop. 9000.

Hecla. See HEKLA.

Hectare. See ARE.

Hectic Fever (Gr. *hektikos*, 'habitual'; see FEVER) is the name given to the fever which occurs in connection with certain wasting diseases of long duration. It is one of the most serious and constant symptoms of consumption, and seems to be directly related to the progressive emaciation which marks the course of that malady. In the morning the patient's temperature may be normal. He may even feel chilly. But towards evening or after eating he grows hot and flushed; and there is a preternatural vividness of expression, which, with the heightened colour, sometimes gives a very fallacious impression of health. The patient retires to bed, has tossing and uneasy sleep, and awakens in the middle of the night, or towards early morning, bathed in cold perspiration, and in a state of extreme languor. The same exhausting cycle repeats itself day after day. The only radical way of treating the fever is to cure the disease on which it depends. When the symptom itself must be combated, a pill containing a grain of sulphate of quinine, with half a grain of digitalis and as much of Dover's powder, taken three times a day, is often serviceable.

Hector, the eldest son of King Priam and Hecuba, husband of Andromache, and father of Astyanax (Scamandrius), appears in Homer's *Iliad* as the ideal of a warlike hero, brave to the last degree, yet faithful and tender alike as husband, father, and son. One of the noblest passages in the *Iliad* describes his parting with Andromache. He holds the same rank among the Trojans as Achilles among the Greeks, and, after bearing the main burden of the war, falls at length by the hand of Achilles enraged at the death of his beloved companion Patroclus. His body was dragged in triumph by the conqueror round the tomb of Patroclus, but was afterwards ransomed by Priam, who caused it to be burned with great pomp.

Hec'uba (Gr. *Hekabe*), the second wife of Priam, king of Troy. During the Trojan war she witnessed the destruction of all her sons, with the exception of Helenus, and at last saw her husband murdered before her eyes by the savage Pyrrhus. After the destruction of Troy she fell into the hands of the Greeks as a slave, and, according to one form of the legend, threw herself in despair into the sea. Euripides (in his tragedy of *Hekabe*) and other ancient tragedians describe her as a tender mother, a noble princess, and a virtuous wife, exposed by fate to the most cruel sufferings.

Heddles. See WEAVING.

Hedge (O.E. *hecg*, from the same root as *haga*, whence modern *hag*; cf. Ger. *hag*—the Fr. *haie* is of Teutonic origin), a living or growing fence, in contradistinction to wall, paling, &c., used for the purposes of enclosure, shelter, and ornament in connection with agriculture, forestry, and gardening. Hedges are very much used in some parts of the world, whilst others, equally cultivated, are almost destitute of them.

Thus, whilst they are very common in many parts of Britain, they are comparatively rare in France and Germany, as well as in America. They are formed of many kinds of trees and shrubs according to the purpose in view, the nature of the exposure, the elevation of the site, and the soil in which they are to be planted. It is essential, whatever plant may be used, that it should bear without injury the degree of annual pruning necessary to keep it trim and within the proper limits of a fence.

For the purposes of agriculture and forestry Hawthorn (q.v.) is almost universally employed in Britain wherever the conditions of soil and situation are favourable to its growth. When properly attended to, especially in respect of annual pruning, it is the most effectual fence for domestic animals, and also an excellent shelter. On elevated sites, those exceeding 1000 feet above sea-level, it does not succeed well. In such positions elder, mountain ash, &c. are planted for shelter in the form of hedges, but are deficient in the other qualities of a fence. Beech-hedges are familiar in some districts. Substitutes for hawthorn in providing shelter by the seaside are found in sea-buckthorn, snowberry, scarlet dogwood, sloe, wild-pear, &c., but none of them are of value in repelling cattle. Ornamental hedges are formed of holly, yew—the latter is regarded as poisonous when eaten by cattle, horses especially, and should therefore be selected only for positions which they cannot approach—arbor vitae, laurel, privet, barberry, both evergreen and deciduous; beech, hornbeam, &c. In Orkney, some parts of the west of Scotland and Wales, and in the south of England and many parts of the coast of Ireland, permanent hedges of fuchsia, arbutus, and other beautiful evergreen or flowering shrubs are to be found.

In the United States the English hawthorn is useless as a hedge-plant, as the foliage is late, is destroyed by the heat, and is much infested by insects; the native thorns are little better. In various parts of the states where hedges are employed serviceable plants are bodock (see BOIS D'ARC), honey locust, pyracanth, the Macartney rose, buckthorn, barberry, &c.

Hedges were in use among the ancient Romans, chiefly for the enclosure of vineyards and gardens. It is probable that they have existed in England since the times of the Romans, although not very common till the end of the 17th century; but they are supposed to have been first introduced into Scotland and Ireland by the officers of Cromwell's armies.

Hedgebote, an old word for the right of a tenant to cut wood on the farm or land for repairing the hedges or fences.

Hedgehog (*Erinaceus europæus*), a widely distributed representative of the genus *Erinaceus*, extending in its range from Ireland to the Caucasus and the Ural Mountains, and as far north as 61°. There are over a dozen other species in Africa and India, and there are two related eastern genera without spines (*Gymnura* and *Hylomys*). The family *Erinaceidae*, which includes these and some fossils, can be traced back to Eocene times. Among the distinctive features of the hedgehog the following may be noted: the covering of the back and sides with short, grooved, elastic and very mobile spines, which are specialisations of hair; the stiff coarse hair on the face and under parts; the strongly developed musculature by which the body can be rolled up into an almost invulnerable ball; the conical muzzle with a naked tip; the small black eyes; the well-developed external ears; the very short tail (1½ inch); the short legs with plantigrade feet; the five digits on each foot, with curved compressed claws suited for climbing, not for bur-

rowing; the presence in the female of three pairs of teats on the abdomen, a pair in the axilla, and another pair in the groin. Among more technical features the following may be mentioned: the tibia and fibula of the hind-leg coalesce at their lower end; the pelvic girdle is very broad; the zygomatic arch of the skull is complete; the bony palate is incompletely ossified; the back teeth bear sharp cusps well suited for crunching insects. Spineless forms occasionally occur as sports.

Common Hedgehog
(*Erinaceus europæus*).

The hedgehog rests during the day at the roots of the hedge, or in a hole at the foot of a tree. It hunts at night, uttering a cry 'between a grunt and a squeak.' The senses of hearing and smell are

acute. The food consists largely of insects and their larvæ, slugs, snails, and earthworms. Hedgehogs have been known to kill adders and mice, and though they occasionally eat eggs or young birds, they do very much more good than harm. Their natural enemies are carnivores, such as foxes and badgers; to the adder's poison they are immune, as also to the toxins of tetanus and diphtheria. In hot and dry weather hedgehogs lie quiet; they are active after rain. They hibernate in winter; nutrition and excretion come to a standstill; the heart-beats and breathing movements are very sluggish; a brownish mass of fat about the neck, armpit, and back (badly called 'the hibernating gland') is slowly absorbed; intimate changes affect the whole body. From four to eight young ones are born about midsummer, and there is sometimes a second litter. A litter of ten has been recorded. There is a nest of dried leaves and the like. The gestation lasts about a month. The young ones are blind at birth, relatively flat, and with very flexible spines. The flesh of the hedgehog used to be regarded as a delicacy by gypsies and others.

Hedgehog Plant, a name given to those species of medick (*Medicago*) which have the pods spirally twisted and rolled up into a ball beset with spines. They are particularly plentiful on sandy grounds near the sea in England, and in some parts of South America; and their pods are too plentiful in the South American wool imported into Britain. They afford excellent food for sheep and cattle.

Hedge-mustard (*Sisymbrium*) a genus of plants of the natural order Cruciferae, annual or rarely perennial herbs, with very various foliage, small yellow or white flowers, and a long roundish or six-angled pod (siliqua). Several species are natives of Britain, of which one, the Common Hedge-mustard (*S. officinale*), was once employed in medicine for catarrhs and other ailments. It is an annual plant, plentiful in waste places and by waysides, sometimes two feet high, branched, with runcinate or deeply-lobed leaves, stem and leaves hairy.

Hedge-nettle. See STACHYS.

Hedge-parsley. See CAUCALIS.

Hedge-sparrow (*Acceator modularis*) is really a small European Warbler (q.v.) resembling a sparrow in colouring.

Hedin, SVEN ANDERS VON, Swedish geographer and traveller, born at Stockholm in 1865. He

studied at Stockholm and Berlin, and in 1885-86 made his first journey through Persia and Mesopotamia. In 1890 he visited Khorasan and Turkestan, and in 1893 he journeyed through Tibet and China. The years 1899-1902 again saw him in Tibet, in the exploration of which country he has gained his chief fame. His publications include *Journey through Khorasan and Turkestan* (1892), *Through Asia* (1898), *Adventures in Tibet* (1904), *Transhimalaya* (1909), *Southern Tibet* (9 vols. 1917-22), and *With the German Armies in the West* (1915), which he wrote whilst a guest of Germany during the Great War.

Hedley, WILLIAM (1779-1843), born at Newburn near Newcastle, the improver of Trevithick's locomotive. See RAILWAYS.

Hedonism. See ETHICS.

Heem, JAN DAVIDSZ VAN, the greatest Dutch painter of 'still life,' was born at Utrecht in 1606. In 1635 he enrolled himself in the Antwerp guild of painters; and in that city he died in 1683 or 1684. Heem's pictures represent for the most part fruits and flowers, insects and creeping things, and drinking cups, bottles, &c. Masterpieces by his hand are hung in the galleries of Amsterdam, Vienna, Berlin, Munich, St Petersburg, and other places. His drawing and colouring are exquisite, and his use of chiaroscuro unsurpassable.

Heeren, ARNOLD HERMANN LUDWIG, German historian, was born 25th October 1760, at Arbergen, near Bremen. He first made himself known by an edition of Menander's *De Encomiis* (1785), and in 1787 was appointed professor of Philosophy, and in 1801 professor of History, at Göttingen. He married in 1797 a daughter of Heyne, and died 7th March 1842. The striking feature about his teaching and writing was that he studied the peoples of classic antiquity from the modern standpoint, as the title of his principal work shows—*Ideen über Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt* (1793-96; 4th ed. 1824-26; Eng. trans. 1833). Besides this he wrote *Geschichte des Studiums der classischen Literatur seit dem Wiederaufleben der Wissenschaften* (2 vols. 1797-1802), *Geschichte der Staaten des Alterthums* (1799; 5th ed. 1828; Eng. trans. 1840), and *Geschichte des europäischen Staatensystems und seiner Colonien* (1800; 5th ed. 1830; Eng. trans. 1834), which abounded in new views and acute expositions. His *Untersuchungen über die Kreuzzüge* won a prize offered by the National Institute of France. His *Kleine historische Schriften* (3 vols. 1803-8) contain some very interesting treatises and a biography of Heyne. In 1821-26 he published an edition of all his historical works in 15 vols.

Hefe, KARL JOSEPH VON, an eminent Catholic church historian, was born at Unterkochen in Württemberg, 15th March 1809. He studied at Tübingen, and became in 1836 *privat-docent*, and in 1840 professor of Church History and Christian Archæology, in the Catholic theological faculty of that university. He showed himself a dangerous enemy to the dogma of papal infallibility even after his consecration as Bishop of Rottenburg in 1869, by his weighty contributions to the Honorius controversy: *Honorius und das sechste allgemeine Concil* (Tüb. 1870), and *Causa Honorii papæ* (Naples, 1870). But after his return from Rome, in a pastoral epistle in 1871 he gave in his adhesion to the dogma, with the explanation that the infallibility of the pope, as well as that of the church, referred only to doctrine given forth *ex cathedra*, and therein to the definitions proper only, but not to its proofs or applications. Of Hefe's writings may be named an edition of the Apostolic

Fathers (1839; 4th ed. 1855); *Chrysostomus-Postille*, a translation (1845; 3d ed. 1857); *Die Einführung des Christentums im südwestlichen Deutschland* (1837); *Der Kardinal Ximenes und die kirchlichen Zustände Spaniens im 15ten Jahrhundert* (1844; 2d ed. 1851; Eng. trans. by Canon Dalton, 1860); *Beiträge zur Kirchengeschichte, Archäologie und Liturgik* (1864-65); and especially his magistral *Konziliengeschichte* (Freiburg i. B., 10 vols. 1855-90, including continuation by J. Hergenröther; trans. 1871-96, 5 vols., to the Second Council of Nice). He died 5th June 1833.

Hegel, GEORG WILHELM FRIEDRICH, was the last in a succession of four great writers, who during the later part of the 18th and the first quarter of the 19th century developed the idealistic philosophy of Germany; the other three being Kant, Fichte, and Schelling. He was born at Stuttgart on the 27th August 1770, and educated at the university of Tübingen, where he formed an intimate friendship with Schelling, his philosophical predecessor. Schelling was five years younger than Hegel, but very precocious. His rapid intuitive genius urged him to express his thoughts almost before they were ripe for expression, and he had begun to publish important contributions to philosophy even before his student-life had come to an end. Hegel, on the other hand, was slow in his intellectual development, and from a desire for systematic completeness and consistency he was unwilling to utter his thoughts till he had made all their relations clear to himself. Consequently he passed through the university without any special distinction, and it was not till six years after he left it—years during which he maintained himself by acting as a private tutor—that he began to seek academic work and to bring his views upon philosophical questions before the public.

In 1801, however, he entered upon his scholastic career at the university of Jena, publishing at the same time an essay on the difference between the philosophies of Fichte and Schelling, in which he on the whole placed himself on the side of the latter, though not without indicating some divergences of view. From 1801 to 1806 he continued to teach in the university of Jena, first as a *privat-docent* (or licensed lecturer), and then as a professor extra-ordinary, and in the early part of that period he joined with Schelling in writing a philosophical periodical called the *Critical Journal of Philosophy*. At this time the two philosophers were so closely identified in their views that there has been considerable dispute as to the authorship of some of the articles. In one of Hegel's latest contributions, however, the reasons for his subsequent separation from Schelling are clearly indicated. It was not till 1807 that Hegel published the *Phenomenology of the Spirit*, the first work in which he fully exhibited the depth and independence of his philosophic genius. By this time, mainly in consequence of Napoleon's victory over the Prussians, the university of Jena was for a time broken up, and Hegel was forced to find employment as the editor of a newspaper at Bamberg. In the following year he was appointed director of the gymnasium or public school of Nuremberg, where he remained during the next nine years. In 1811 he married, and in the following year he published the first volume of his greatest work, the *Logic*, a treatise which treats of what is ordinarily called Logic in connection with Metaphysics. It was not till 1816 that his growing fame as a writer secured his nomination to a professorship in Heidelberg; this, two years after, he exchanged for the chair of Philosophy at Berlin formerly occupied by Fichte. There he continued to teach till the 14th November 1831, when he was carried off by a sudden attack of

cholera. During these years he published several works, of which the most important is the *Philosophy of Right*, and contributed several articles to the *Philosophical Year-book*, a journal which was mainly, though not exclusively, the organ of his disciples. His influence during this period was so great that he might also be said to have been the philosophical dictator of Germany. At his death a number of his friends combined to prepare a complete edition of his works, in which they included not only the books he had published during his lifetime, but also reports of courses of lectures delivered by him upon many departments of philosophy. Among these may be mentioned specially his lectures upon the *Philosophy of Religion*, the *Philosophy of Art*, the *History of Philosophy*, and the *Philosophy of History*.

It is impossible within our limits to characterise adequately the work of such an encyclopædic mind as Hegel's, but it is possible in a few words to indicate the main tendencies of his philosophy. In the first place, Hegel was an *Idealist*. By this it is meant, however, not that he reduced the facts of the outward world to ideas, or held that there are no facts but the ideas of the individual mind. It is meant only that he held that we must ultimately explain the world as the manifestation of a rational principle. Kant had shown that all known or knowable objects are relative to a conscious subject, and that therefore we cannot legitimately treat them as *things in themselves*—i.e. as things that might exist by themselves even if there were no intelligent principle in existence to know them. He had shown, in other words, that existence means nothing unless it means existence for a self. Hegel carried the argument a step further, and maintained that the world of objects is not only related to an intelligence, but that it can be nothing but the revelation or manifestation of intelligence. In this way he sought not only with Kant to show the impossibility of a materialistic explanation of things, but to prove the necessity of an idealistic explanation of them. He did not therefore deny the reality of the material world, but maintained it to be an imperfect or incomplete reality which could not exist by itself without something else to supplement it. He attempted to prove that matter is the necessary object and counterpart of spirit, in which spirit reveals, and through which it realises, itself; and that indeed the material world only shows its ultimate meaning, when we regard it as the natural environment and basis for the life of spiritual beings.

In the second place, Hegel connected this idealistic or spiritualistic view of things with the great modern idea of *Evolution* or *Development*. That idea is often supposed to involve that the highest and most complex existences may be traced back to the lowest and simplest—that, for example, we may hope ultimately to explain the phenomena of life by mechanics and chemistry, and the phenomena of thought and will by the powers of nutrition and sensation which are manifested in the lowest forms of animal life. And in a similar way the idea of evolution is supposed to imply that we can explain the highest forms of religion as nothing more than refined reproductions of the crude superstitions of savages. Hegel, on the other hand, maintains that, as it is the developed form that first tells us what was in the germ, as it is only the life of the man that shows what was latent in the child, so under the idea of evolution we must take the man as explaining the animal, and the organic as exhibiting what is latent and obscure in the inorganic. Not, indeed, as if the special sciences of mechanics, chemistry, biology, &c. were not right in keeping to their own special principles.

But, in the last resort, when we attempt, as it is the business of philosophy to attempt, to see all these spheres of existence in their relation to each other, as well as to the intelligence that knows them, we must regard nature as becoming self-conscious—i.e. as revealing its secret meaning only to and in man; and we must find the key to the secret of man's nature in the highest energies of his moral and intellectual life.

Finally, in attempting to work out this idea of evolution Hegel teaches us to regard it as a *progress by antagonism*. While, therefore, there is a unity of principle in all things that exist, yet, in order to develop, this principle must differentiate itself, must manifest itself in different forms, and these forms must inevitably come into conflict with each other. In truth, however, the forms which have thus come to be opposed are really complementary or necessary to each other, and therefore their conflict is limited by the unity which they express, and which ultimately must subordinate them all to itself. This idea may be most easily illustrated by reference to the unity of the social organism, which manifests itself in a division of labour between its members. In developing their powers these members are brought into antagonism with each other; but if their conflict and competition is not to destroy the society, it must be subordinated to their co-operation. That the organic unity of the society should maintain itself means, therefore, that there should be such community between its members that all their conflict and competition should only lead to a better distribution of functions between them, and should thus contribute to direct and improve the life of the society as a whole. This illustration may give some clue to the principle which Hegel works out in application to all spheres of the life of nature and of man. On it is based Hegel's ultimate division of philosophy into the three departments—logic, or the science of thought in its pure unity with itself; the philosophy of nature, in which the ideal principle, which is supposed to exist in all things, is shown to underlie even the externality of the material world; and the philosophy of spirit—i.e. of the life of man as a self-conscious being, standing in relation to a material world, which seems to be altogether external to him, and yet subordinating it to his own life. But these words are the indication of ideas which it would take many pages fully to explain.

Hegel's collected works, edited by a number of friends and disciples, appeared after his death in 19 vols. (1832–87). On his life and philosophy, see Rosenkranz, *Hegels Leben* (1844), *Apologie Hegels* (1858), and *Hegel als Deutscher Nationalphilosoph* (1870); Haym, *Hegel und seine Zeit* (1857); Köstlin, *Hegel* (1870); the histories of this period of German philosophy by Michelet (1838), Chalybaeus (5th ed. 1860), and especially Erdmann (vol. iii. 1848–53); Hutchison Stirling, *Secret of Hegel* (2 vols. 1855); Wallace, translation of the *Logic from the Encyclopædie*, with prolegomena (1874); E. Caird, *Hegel* (in 'Philos. Classics' series, 1883); Seth, *The Development from Kant to Hegel* (1882); *Hegels Aesthetic*, by Kedney, *Hegels Logic*, by W. T. Harris, *Hegels Philosophy of Religion*, by A. M. Fairbairn, *Hegels Philosophy of History and the State*, by G. S. Morris (Chicago, 1886–90); several works by McTaggart and by Wallace; Croce's *What is Living and what is Dead in the Philosophy of Hegel* (trans. Annalie, 1915); Reyburn's *Ethical Theory of Hegel* (1921); Stace's *Philosophy of Hegel*. There are translations of Hegel's *Philosophy of History*, by Sibree (1857), of the *Philosophy of Right*, by Dyde, of the *Philosophy of Art*, by Hastie and by Bosanquet, of the *Philosophy of Religion*, by Speirs and Sanderson, and of the *History of Philosophy* (3 vols. 1892–96), by Miss Haldane.

At the time of Hegel's death his philosophy was dominant in Germany; and at that time there seemed to be a consensus among his pupils as to its interpretation.

But division soon arose between those who, following the apparent tendency of their master, interpreted the principles of Hegelian philosophy in an orthodox and conservative spirit, and those who emphasised its negative dialectic, and used it as a weapon of attack against the existing order of church and state. After the appearance of Strauss's *Leben Jesu* (1835) the school may be regarded as having broken up into 'Old Hegelians,' or 'the Right'—Hotho, Gabler, Erdmann, Daub, Marheineke, Göschel; 'the Centre'—Rosenkranz, Gans, Vatke, Conradi; and 'the Left,' the 'Young Hegelians'—Strauss, Michelet, Feuerbach, Bruno Bauer, Ruge, Karl Marx—of whom some even maintained that the legitimate development of the philosophy was found in atheism, materialism, and communism. The result of these controversies was that the Hegelians almost ceased to exist as a definite school; but the ideas of Hegel still retain their power, and form one of the most important elements in modern culture. Many who cannot be regarded as in any strict sense Hegelians have owed their main philosophic stimulus to Hegel—such as F. C. Baur, Schweigger, Zeller, Kuno Fischer; and the so-called 'pseudo-Hegelians'—I. H. Fichte, Weiss, Chalybaeus, Ulrici, Carrière. Hegelianism is the most important element in the philosophy of the popular pessimist Von Hartmann. Out of Germany, Hegelianism is represented more or less directly by Heiberg and Martensen in Denmark; in France, by Leroux, Prévost, and others; in Italy, by Vera and Mariano; in Britain, by Hutchison Stirling, J. Caird, E. Caird, Wallace, Green, and Bradley; in America, by W. T. Harris and others.—Hegel's eldest son, Karl (1813–1901), became distinguished as an historian, and was professor of History successively at Rostock and Erlangen.—Another son, Immanuel (1814–91), held high administrative offices under the Prussian government, and was leader of the Conservative and High Church party.

Hegesippus, the earliest of the Christian church historians; of his life we know nothing save that he was almost certainly a Jewish convert and that he flourished about the middle of the 2d century. From a statement of his own, preserved in Eusebius (iv. 22), we learn that he made a journey to Rome, visiting Corinth upon the way, and when at Rome compiled a list of the bishops of the Roman see down to Anicetus (156–67 A.D.). Further, he is represented as adding 'to Anicetus succeeds Soter; and to Soter, Eleutherus' (175–89). Hegesippus must thus have written most of his history previous to 167 A.D., and he most probably published it early in the episcopate of Eleutherus. This agrees well with the statement of St Jerome that Hegesippus had bordered on the apostolic age (*vicinus apostolicorum temporum*), for if born so early as 120 he came very near the age of St John. His work was entitled *Five Memorials of Ecclesiastical Affairs*, and appears not to have been a complete and continuous history, although extending from the death of Christ to the writer's own age. Unhappily it survives only in a few fragments which Eusebius had embodied in his own history, the most important of which are his account of the martyrdom of St James and also of St Simeon of Jerusalem. Eusebius commends his doctrinal fidelity, and St Jerome the simplicity and unpretentiousness of his style. The question has been much discussed whether Hegesippus belonged to the Judaizing Christian party or not. Baur went so far as to pronounce him a declared enemy to St Paul, relying mainly upon a passage preserved in Photius, in which Hegesippus declares that an opinion of many, corresponding exactly to what is said in 1 Cor. ii. 9, is contradictory to the express word of the Lord himself in Matt. xiii. 16. But it is much more likely that Hegesippus is here aiming at the Gnostic misconception of these words rather than that of St Paul, for the reference is obviously to their claims to special spiritual insight; while a further passage preserved, used by the Tübingen school to fortify their inference—viz. that those who were

trying to destroy the sound rule of saving doctrine as yet hid themselves in holes of darkness—can by no possibility be understood as a reference to the fearless and vehement apostle of the Gentiles.

The fragments of Hegesippus will be found in vol. i. of Routh's *Reliquiæ Sacre* (1847), and in vol. ii. of Grabe's *Spicilegium*.

Hegira, **HEJRA**, or **HIJRA** (an Arab word which means 'going away'), the term commonly used to indicate Mohammed's flight from Mecca, 13th September 622 A.D. In 639 or 640 the Calif Omar instituted a new Moslem calendar, to begin with the first day of the first month of the year in which the flight took place. The Mohammedan year, as a lunar year, is shorter than ours by 10 days, 21 hours, and 14½ seconds. A rough and ready method for finding the year in our calendar corresponding to a given year in the Mohammedan is to subtract from the latter $\frac{1}{3}$ of itself and add 622 to the remainder. To find the precise year and day, multiply the year of the Hegira by 970224, strike off from the product six decimal figures, and add 621.5774; this will give the year of the Christian era; and the day of the year is got by multiplying the decimal figures by 365.

Helberg, the name of two Danish authors. See DENMARK.

Heide, the chief town of northern Ditmarsh, in the Prussian province of Sleswick-Holstein, 58 miles by rail WSW. of Kiel. Chief industries are shoemaking, paper-making, and brewing. Heide is the birthplace of Klaus Groth. Pop. 10,000.

Heidelberg, an ancient city of Germany, in the state of Baden, extends for about 3 miles along the left bank of the river Neckar, in one of the most beautiful districts in the country, 13 miles by rail SE. of Mannheim and 54 S. of Frankfurt-on-the-Main. It lies 380 feet above sea-level at the base of the Königsstuhl (1863 feet). Amongst its most important buildings are the church of the Holy Ghost, a splendid example of Late Gothic architecture, in which service according to the Catholic and Protestant rituals is simultaneously carried on; the church of St Peter's, on the door of which Jerome of Prague nailed his celebrated *theses*; and the magnificent ruins of the castle, which stand on a hill 330 feet above the town. Begun at the close of the 13th century, and added to in 1410, 1559, and 1607, it was formerly the residence of the Electors Palatine, and was in great part destroyed by the French in 1689 and 1693, and further injured by lightning in 1764. The Friedrichsbau has been elaborately restored. In the cellar under the castle is the famous Heidelberg Tun, once capable of containing 50,000 gallons of wine. Heidelberg is celebrated for its university, which was founded by the Elector Rupert I. in 1386, and continued to flourish until the period of the Thirty Years' War, when it began to decline. In 1802, however, when the town with the surrounding territory was assigned to the Grand-duke of Baden, a new era commenced for the university, and it rapidly became famous. It comprises faculties of theology, law, medicine, and philosophy. Its library consists of some 500,000 volumes and 6000 MS. Many of the most famous German scholars have been professors here—Reuchlin, Ecolampadius, Spanheim, Puffendorf, Voss, Schlosser, Creuzer, Gervinus, Paulus, Kuno Fischer, Helmholz, Bunsen, Blüntschi, &c. The quincentenary of the university was celebrated with elaborate ceremonial in 1886. Heidelberg, originally an appanage of the bishopric of Worms, became in the end of the 12th century the seat of the Counts Palatine, and continued to be so for nearly six centuries. After the Reformation Heidelberg was long the headquarters of German Calvinism, and

gave its name to a famous Calvinistic Catechism (q.v.). The trade is chiefly in books, tobacco, beer, and wine. The town suffered much during the Thirty Years' War, was savagely treated by the French in 1689, and was in 1693 almost totally destroyed by them. Pop. (1871) 19,988; (1910) 56,010; (1919) 69,806.

Heidenheim, a town of Württemberg, 31 miles N. by E. of Ulm. Its industries include paper-mills, cotton, woollen, and chemical factories, as well as dye-works and breweries. The ruins of an ancient castle overlook the town. Pop. 18,000.

Heidenstam, **KARL VERNER VON**, Swedish author, born at Olshammer in 1859. For a time he studied art, but turning to literature he became one of the most prominent writers in Sweden, both in prose as an historical romanticist and in verse. In 1916 he was awarded the Nobel prize for literature. His works include *Vallfart och Vandringsår*, *Dikter*, *Sankt Göran och Draken*, *Folkungatradet*, *Nya Dikter*. See Stork, *Sweden's Laureate* (1919).

Heights may be determined by four methods: by Trigonometry (q.v.), by Levelling (q.v.), by ascertaining and comparing the atmospheric pressure at top and bottom of the height by the Barometer (q.v.), or by ascertaining and comparing the boiling-point of water at the top and bottom by the Thermometer (q.v.). See also SURVEYING.

Heijn, or **HEYN**, **PIET**, a famous Dutch admiral, was born in 1578 at Delfshaven, near Rotterdam. After an adventurous career, he became vice-admiral under the Dutch East India Company. In 1624 he sailed to South America and defeated the Spaniards near San Salvador (Brazil), and again in 1626 in All Saints' Bay (Bahia), when he took above twenty of their ships, returning to Holland with an immense booty. Two years later he captured the Spanish silver flotilla, the value of which was estimated at 16,000,000 Dutch guilders. As a reward for this success he was in 1629 named Admiral of Holland. On 20th August of the same year he met his death in a sea-fight against the privateers of Dunkirk off that town. A marble monument is erected to his memory in the old church at Delft.

Heilbronn, a town of Württemberg, situated on the right bank of the Neckar, in a beautiful and fertile region, 28 miles by rail N. of Stuttgart. The streets of the old mediæval town are narrow, and the houses have quaintly ornamented gable-ends and tapering pinnacles. The church of St Kilian, partly Gothic and partly Renaissance; the old town-hall; the *Diebsturm* (Thief's Tower'), in which Götz von Berlichingen was confined; and the house of the Teutonic Knights, are the principal buildings. The chief industries include the manufacture of silver-plate, paper, sugar, salt, chicory, and chemicals, and there are iron and other metal foundries and machine-shops. Fruit and wine are largely grown. Commercially the importance of Heilbronn depends upon its trade in groceries, corn, and wood, and upon its fairs for cattle, leather, wool, and fruit. In the vicinity gypsum and sandstone are quarried. Heilbronn is first mentioned in 741; in 1360 it became an imperial town; it suffered during the Peasants' War and the Thirty Years' War, and in 1802 it fell into the hands of Württemberg. Pop. 44,000.

Heiligenstadt, a town of Prussian Saxony, situated on the Leine, 32 miles ENE. of Cassel, has manufactures of cotton, cigars, and paper; pop. 10,000.

Heilsberg, a town of Prussia, 40 miles S. of Königsberg. It was originally the chief town of Ermeland, and received town rights in 1308. Here the allied Russians and Prussians under Bennigsen

defeated the French under Soult and Murat on 10th June 1807.

Heilsbronn, a Bavarian village of Middle Franconia, 16 miles SW. of Nurnberg by rail, was the seat of a celebrated Cistercian monastery, which owed its origin to Bishop Otho of Bamberg in 1132. The burgraves of Nurnberg were buried here till the end of the 15th century, and after them the Franconian branch of the Hohenzollerns. Although the monastery was suppressed in 1555, the church still retains a large number of highly-interesting sepulchral monuments and other examples of mediæval German art.

Heimskringla. See ICELAND, SNORRI STURLASON.

Heine, HEINRICH, the most prominent figure in German literature since Goethe and Schiller, was born of Jewish parents on 13th December 1797 in Düsseldorf-on-Rhine. His boyish heroes were Napoleon and Napoleon's stalwart grenadiers and drummers. At a Roman Catholic school in Düsseldorf he learned what it was to be jeered at and ill-treated on account of his race and creed. In 1815 he was sent to Frankfurt to learn banking, but gave it up at once; routine work was wholly repugnant to him. Next he tried trading on his own account in Hamburg, but soon failed. About the same time he fell in love with a daughter of his rich uncle, Solomon Heine of Hamburg; and his grief at the non-requtal of his passion by Amalia, and later her sister Therese, formed a stimulus to poetic creation. In 1819 his uncle gratified the desire of his heart by sending him to the university of Bonn. There, and subsequently at Berlin and Göttingen, he studied law, taking his doctor's degree at Göttingen in 1825. But his thoughts were more given to poetry and kindred subjects than to legal studies. At Bonn A. W. Schlegel helped him to master the technique of his art. At Berlin, in the circle over which Rahel, the wife of Varnhagen von Ense, presided, he found himself for the first time in a wholly congenial atmosphere; and the close friendship formed between them lasted till Rahel's death. In the efforts then being made in Berlin by Gans and others to inspire the Jews with a sense of the value of European culture Heine also took an active share. In 1821 he published his first volume of *Gedichte*, which at once arrested the attention of the observant. Along with unsuccessful essays in tragedy-writing, a second collection of poems, entitled *Lyrisches Intermezzo*, his Sapphic love-plaint, appeared in 1823. But the general public only became aware that a new writer of the first magnitude had risen in the heavens of literature when in 1826-27 the first and second volumes of the *Reisebilder* came into their hands. In the latter year Heine likewise celebrated his triumph as conqueror of a new poetic province in *Das Buch der Lieder*, which, though consisting almost entirely of poems already published, created throughout Germany such excitement as had not been since Schiller's *Rauber* came out. Many of Heine's best songs are as much loved for the beautiful melodies to which they were set by Schumann and Mendelssohn as for their own intrinsic merit.

These two works are Heine's masterpieces; he never wrote anything to excel them. Nearly all his writings are of an occasional nature, either lyrical, or autobiographical, or journalistic, or polemical. But the genius in them is permanent, and in many respects of the highest quality. The great charm of his work is due to the fact that he was a superb literary artist, a consummate master of style in both verse and prose. He was essentially a lyrist; his song has the spontaneity and melody of a skylark's burst, or the quaint

naïveté, the pathos, the simple sweetness of the best *Volkslieder*. His was a very complex and paradoxical nature: he united in himself the passionate energy of a Hebrew prophet, the sensuous feeling of a pagan Greek, and the dreamy sentimentalism of a mediæval German. The simplicity of a pure child of nature is blended with the keenest wit, with an irony that is apt to grow bitterest when his lyric mood is sweetest, and a power of mocking sarcasm that cuts sharp and deep. His mastery in the art of self-torture taught him how to lash the follies and absurdities of the conventional world with the roughest raw-hide of Mephistophelean scorn. His writing is full of surprises, as capricious as the sea he loved so passionately. His intellect has the suppleness and grace and sinewy strength of a highly-trained athlete, but it neither walks nor glides; it leaps, and turns and doubles with the glancing swiftness of a swallow on wing. He passes from exquisite tenderness to sardonic cynicism, from melancholy sadness to sly insidious humour, in the twinkling of an eye. Nor is sweet dreamy sentiment in him any hindrance to remarkable precision of thought. But perhaps his strangest quality is an audacity of intellect that hesitates at no utterance, that recoils from no jest on things even the most sacred. His language is terse, clear, and rich in word-pictures, mostly original, seldom glittering with the tinsel of mere conventional imagery. One of his favourite devices is to mingle the images of dream-land, unearthly and weird, with images of true poetic beauty forged from the raw ore of commonest reality. But, notwithstanding his delicate poetic sensibility, and the depth and sincerity of his feeling, his poetry had its origin in dissonance of soul; the *Weltschmerz* had eaten deeply into his heart. The prophet of poetic pain, he scruples not to lay bare his soul to us without reserve; we see the man just as he is, with all his beauties, with all his faults. And these last are neither few nor venial. His sensuousness often degenerates into obscenity and coarseness, his wit into vulgarity and affectation, his irony into malice and persiflage. He becomes cynical, frivolous, a mocker. Not only does he show no sense of reverence himself, he wantonly outrages the reverent feelings of his readers. And he has just 'femininity' enough in his constitution to find pleasure in spiteful personalities.

In June 1825 he had himself baptised a Christian, exchanging his original name Harry for Christian Johann Heinrich, though he used only the last of the three. This step, which proved to be one of the most unfortunate of his life, was not taken from conviction, but simply to secure for himself the common rights of German citizenship, and to give himself a respectable standing in the world. Heine, however, by this act only alienated from him the esteem of the orthodox among his own people. His revolutionary opinions, and his trenchant and outspoken criticism of the governments of the day, always remained insuperable hindrances to his appointment to any official employment in Prussia, and even in Germany. During the years of early manhood, from 1823 onwards, he was racked by excruciating headaches, which reacted upon his temper and his mood. Then again, he lived on a strained footing with his Hamburg relatives; they were shrewd business folk, and could see no virtue in poetship, and nothing 'divine' in the poet himself—and Heine was inclined to presume upon his success. He was always greatly harassed by the unscrupulous tyranny of the public censor: his works came from the press grievously maltreated, and against this injustice he could get no remedy. Moreover, he felt himself coming perilously near to

the doors of a German fortress-prison. No wonder then that, when his enthusiasm was roused by the July revolution in Paris, he turned his back upon Germany and hastened thither (1831), going into a voluntary exile from which he never returned. But he had not been altogether idle during the six unhappy years since 1825. He had travelled to England and Italy; he had worked on the editorial staff of Cotta's newspapers in Bavaria; and, besides *Das Buch der Lieder*, he wrote four volumes in all of *Die Reisebilder*, the last two (1830-31), however, inferior to the others.

In Paris Heine, whose intellectual character and intellectual sympathies were always more French than German, soon made himself at home. He secured a patron in the minister Thiers, and consorted with the greatest writers and chief celebrities then living in Paris; and yet he often longed to return to the Philistines of Germany. For, in spite of the fact that he railed at his Jewish descent and poured scorn upon his German compatriots, he was always a German at heart and had a secret admiration for the persecuted people from whom he was sprung. Nor was this by any means the only inconsistency in his nature. Though he scoffed at religion, yet was there a deeply religious vein in his composition—the Bible was always a favourite book with him; though he was deplorably lax in his ideas and practices of morality, he was not insensible to the beauty of purity; and though he ridiculed the vagaries of the romantic school, he cherished a lingering fondness for its ideals.

The July revolution seems to have awakened in Heine the first stirrings of manly seriousness. He turned from poetry to politics, with which he had always coquetted ever since he began to write. He entered Paris glowing with the inspiration of the revolution. He assumed the rôle of a tribune of the people, a leader of the cosmopolitan democratic movement, the object of which was to effect the union of the peoples of all nations in a brotherhood of liberty and progress. It was under the inspiration of this ideal that he greeted with acclamation the socialistic doctrines of the St Simonists, at all events in so far as economics and religion were concerned. One of the chief aims of his life was to make the French and the Germans acquainted with one another's intellectual and artistic achievements. This was the ground out of which sprang the *Französische Zustände* (1833), a collection of papers on affairs in France, first printed in the *Augsburger Allgemeine Zeitung*; *De l'Allemagne* (1835), the French version of *Die Romantische Schule* (1836)—of Germany, that is; and *Philosophie und Litteratur in Deutschland*, forming part of the second of the four volumes of miscellaneous writings entitled *Der Salon* (1835-40). Heine was always an Ishmael, not only of literature but also of politics—he would fight under nobody's flag but his own; and hence, with his aristocratic instincts and refined taste, he refused to make common cause with the revolutionary fugitives from Germany who found an asylum in Paris. Yet he seems not to have been altogether above the suspicion, if not of insincerity, at least of desiring to win the crown of the political martyr without undergoing the pains of political martyrdom. At all events, his ambiguous attitude brought down upon him the spiteful enmity of his revolutionary compatriots; and their hostility was greatly embittered by the publication of Heine's ungenerous attack upon his former friend and political associate Börne (1840). Nor did he enjoy any better savour of grace from the governments of Germany because of his personal aversion to their dreaded enemies. In 1835 his writings, past and prospective together, had been

condemned, along with those of the Young Germany school, by the Confederation parliament at Frankfurt, and this measure was not repealed until 1842.

Although Heine loved liberty with his whole soul, and lived and suffered for it, it seems never to have been anything more to him than a romantic ideal. The truth is he stood on the continental watershed of two wholly different *Weltanschauungen* ('world-conceptions'), the old world of romantic feudalism and the new world of scientific inquiry and individual freedom. He had nothing but scorn for the tyrannous era of priestcraft and aristocracy, and nothing but sarcasm and ridicule for the inert mass of commonplace Philistines, with their intellectual apathy and self-satisfied somnolence. Respecting the future he cherished the most sanguine hopes. He foresaw in imagination the glorious regeneration of the peoples; and Germany was, he believed, the agent of promise destined to effect this great change. Nor must it be imputed to him for blame that he never grasped the problem of the practical realisation of his ideal, that he never thought of the means and forms by and in which this romanticism of the revolution of progress was to be converted into the concrete realism of accomplished fact. For, though he criticised the past and projected his hopes into the future, his heart was knit to the past with the tenderest associations of feeling, and his sceptical intellect would not allow him to remain blind to the imperfections of his prosopicient dreams. It need not therefore excite surprise to find traces of the sentimental declaimer in Heine's war-song of liberty, despite his evident earnestness in the cause. For, after all, his love for humanity was beyond all suspicion warm and deep, and his zeal for intellectual freedom unquestionably sincere.

On the eve of a duel (September 1841), which his book on Börne cost him, Heine married in due legal form Eugénie Mirat ('Mathilde'), a Paris grisette, with whom he had been living some years. In 1844 his uncle Solomon died, and a quarrel with the family ensued, because of their refusal to continue the annuity he had received from his uncle from the year he settled in Paris. A compromise was effected early in 1847: the payment of the annuity was resumed, Heine pledging himself not to publish anything reflecting on the family. For this reason his *Memoiren*, which he anticipated would be his greatest work, was withheld from publication. The fate of the manuscript is a mystery. Heine speaks of having destroyed it. Yet it is both asserted and denied that it passed into the possession of his brother Gustav. At all events the fragmentary *Memoiren* published in 1884 can scarcely be part of the original work; it is in all probability a portion of the new version begun by Heine. The revolution of 1848, unlike that of 1830, failed to awaken any enthusiasm in him. Since 1837 his eyes had caused him much pain, and from 1848 onwards he was confined to bed by spinal paralysis. He lingered on in excruciating pain, borne with heroic patience and endurance, until 17th February 1856. But no amount or intensity of bodily suffering could break his spirit or impair his creative power; he jeered and wrote to the last. During these years he published *Neue Gedichte* and *Deutschland*, a satirical political poem, in 1844; *Atta Troll*, the 'swan-song of romanticism,' in 1847; a collection of poems, *Romanzero*, in 1851; and three volumes of *Vermischte Schriften*, in 1854.

Complete editions of Heine's works have been edited by Strodtmann (27 vols. 1861-66), Karpeles (12 vols. 1885 and 9 vols. 1886-87), and Elster (7 vols. 1887-90), and in French by himself, assisted by Gérard de Nerval and others (14 vols. 1852 *et seq.*). See German biographical

and critical studies by Strodtmann (1867-69), Bölsche (1888), and Karpeles, who edited *Heine's Memoirs from his Works, Letters, and Conversations* (Eng. trans. 1910); *The Family Life of Heine*, edited by his nephew, Baron L. von Embden (trans. 1893); Camille Selden's *Last Days of Heine* (1884); Brandes's *Young Germany* (trans. 1905). French monographs by Legras (1897) and Lichtenberger (1905); and W. Sharpe's *Life* (1888). Heine's poetry has a fatal fascination for translators. Versions have been essayed by Ackerlos (1854), Wallis (1856), Lord Lytton, Sir Theodore Martin (1879), J. Geikie (1887), J. Payne (1911), A. Gray (1923). Parts of the prose were translated by Stern (1873), Snodgrass (1882), Storr (1887), Havellock Ellis (1888), R. M. Clintoock (1890), and others. The twelve-volume translation of the works, prose and verse, begun in 1891 by C. G. Leland, was interrupted by his death, but completed in 1905 by Miss M. Armour.

Heineccius, JOHANN GOTTLIEB, a jurist of Germany, born 11th September 1681 at Eisenberg, was professor of Philosophy at Halle from 1713, and from 1720 professor of Law. In the latter capacity he went in 1723 to Franeker, and in 1727 to Frankfurt-on-the-Oder; but in 1733 returned, as professor of Law and Philosophy, to Halle, where he died 31st August 1741. Heineccius belonged to the school of those who treat law in dependence upon philosophical principles. His chief works were *Antiquitatum Romanorum Jurisprudentiam Illustrantium Syntagma* (1718); *Historia Juris Civilis Romani* (1733); *Elementa Juris Germanici* (1735); and *Elementa Juris Naturae et Gentium* (1737; Eng. trans. 1763). His *Opera Omnia* (9 vols.) were edited by his son in 1771.—Heineccius's brother, JOHANN MICHAELIS HEINECCIUS (1674-1722), was a celebrated pulpit orator in Halle, and the first who studied seals scientifically. On this latter subject he wrote *De Veteribus Germanorum aliarumque Nationum Sigillis* (1709).

Heinsius, ANTHONY, Dutch statesman, born at Delft, 22d December 1641, studied law at Leyden, in 1688 became Grand Pensionary of Holland, and as the close friend of William III. (of England) guided Dutch politics till his death, 30th August 1720.

Heinsius, DANIEL, a Dutch classical scholar, was born at Ghent, 9th June 1580; was educated at Franeker and Leyden (becoming the favourite pupil of Scaliger), and became professor at Leyden. He died 25th February 1655. He edited many Latin classics, and published Latin poems and orations of his own.—His son, Nicolaus (1620-81), obtained distinction both as a diplomatic agent and as a classical scholar.

Heir. In primitive systems of law the heir is the person who performs the sacred rites on the death of his ancestor, and to whom, as representing his ancestor, the property of the deceased is transferred. There are traces of this primitive conception in the history of Roman law. The later Roman law regards the heir as an universal successor, on whom all the rights and liabilities of the ancestor devolve. An heir might be named by will; in case of intestacy, the law pointed out the line of succession; in some cases equity gave possession to a person who, though not the legal heir, was permitted by a praetorian fiction to succeed to the estate. The liabilities of an heir were restricted by rules which enabled him to separate his own estate from that of the deceased; after Justinian's time this was done by 'making an inventory;' and this 'benefit of inventory' is a feature of modern codes founded on the civil law. It is to be observed that the Roman heir united in himself the rights of the heir, executor, and devisee of English law.

In English law the heir is not the universal successor, but the person who succeeds to the real property of a deceased person not disposed of by

will. He is bound by covenants, &c. which have been made binding on the land; the property which descends to him has been made assets for payment of debt generally; but if the personal estate be sufficient, the executor is the person by whom debts should be paid. The heir is ascertained at the moment of death; thus it is not technically correct to speak of the eldest son of a living person as his heir; the son is *heir-apparent*—i.e. it is evident that he will be the heir if he survives. If a father or brother is nearest in succession to a living person, we call him *heir-presumptive*; he will be the heir if he survives, and if no nearer heir is born. An heir must be sought among persons related by consanguinity to the deceased, males being preferred. Of males in the same degree, the eldest is sole heir; females in the same degree succeed as co-heiresses or coparceners. By the Inheritance Act of 1833 it is directed that descent is to be traced from the last purchaser—i.e. the last person who acquired the land otherwise than by descent. Formerly an estate could not ascend from son to father; but the act places the father next in succession after children and other descendants. For a tabular view of the order of succession, see Williams, *On Real Property*, or Paterson's *Compendium of English and Scotch Law*. The *heirs-general* are the heirs ascertained according to the foregoing rules, as distinguished from the restricted class (heirs of the body, heirs-male, heirs-female, &c.) pointed out by the terms of an entail. Where no heir can be found, the land is escheated to the feudal superior of whom it is held—i.e. usually to the crown. When a person dies intestate, his real estate vests at once in the heir; the heir becomes seised in law without entry on the estate or other formality. The rule which permits an heir to shift the liability for debts to the personal estate was formerly applied even to mortgages; but Locke King's Act, passed in 1854, makes a mortgage debt a charge on the land, unless a contrary intention is expressed.

The law of succession in Ireland is the same as in England.

In Scots law the term heir is less strictly defined than in English law. It is used to include persons who succeed to movables. It also includes persons who take, not by descent, but by gift; thus, for example, 'heirs of destination' or 'heirs of provision' would be described as devisees or donees in English law. 'Heir-apparent,' in Scots law, means an heir who has not made up his titles, the heir-apparent of English law being included under the name of heir-presumptive. Since the Conveyancing Act of 1874 a personal right vests in the heir on survivorship; but for acquisition of feudal title he is still required to make up titles. By the same act it is provided that an heir shall not be liable for the debts of his ancestor beyond the value of the estate. When heritable property has not been settled or disposed of by the owner, the heir-at-law is sought among the legitimate kin of the deceased. As in England, males are preferred; of males in the same degree, the eldest is sole heir; females inherit together as 'heirs-portioners.' But in Scots, as compared with English law, certain points of difference are to be observed. (1) After descendants are exhausted, not the father, but the next younger brother and his descendants succeed; then the next younger again, and so on to the youngest brother, after whom and his descendants comes the next elder brother, and so on up to the eldest brother. Formerly 'fee of conquest'—i.e. land purchased by the deceased—went to the next elder brother, and so on, in preference to the next younger; but the distinction between conquest and heritage was abolished in 1874. (2) The mother of the deceased never succeeds to heritage in Scotland, nor do any relatives who trace through her. (3) Persons born

illegitimate, but rendered legitimate by the subsequent marriage of their parents, are permitted to succeed. See the comparative tabular view in Paterson's *Compendium*.

In England the term 'hereditaments' is used to denote those parts of a man's property which will, if not disposed of, descend to the heir. In Scotland heritable property includes leaseholds, which in England are treated as personal property; certain classes of annuities are also heritable, which would in England be personal.

HEIRS-PORTIONERS, in Scots law, mean either two or more females, being sisters, or sisters and the children, male and female, of deceased sisters, who are entitled to succeed to heritable estate when their ancestor dies without leaving male issue. Thus, if A dies leaving three daughters, all three succeed equally if alive; or if some have already died leaving children, then the children represent the parent, and succeed to the parent's share along with the surviving sisters, all being called heirs-portioners. In such cases the eldest heir-portioner is entitled to the mansion-house of an estate in the country over and above her equal share of the rest. But she has no such right to a house in town, or to a country villa. She alone also takes a peerage or dignity, if there is any in the family. In England coparceners, though resembling heirs-portioners, have not identical rights.

Heirloom (compounded of *heir* and *loom*, originally a 'piece of property,' 'furniture'), in English law, means a chattel, or movable thing, which goes to the heir-at-law by special custom. But the right is obscure. The word is more frequently used now to designate chattels bequeathed or settled so as to be enjoyed by the person for the time being in possession of a family estate or mansion. In Scotland a somewhat similar but by no means identical phrase is used—viz. *heirship moveables*, which was a wider right (abolished in 1868), and included the best articles of furniture in the house of a person who left heritable property.

Hejaz, formerly a Turkish vilayet, is now an independent kingdom, which under El Hussein Ibn Ali, formerly Grand Sherif of Mecca, came into existence during the Great War. The king had himself proclaimed Khalif (q.v.) in 1924. A Wah-hâbi invasion soon compelled him to resign kingship and khali'fat. He was succeeded by his son the Emir Ali as king. The Hejaz is not comparable with other countries of the world, but is merely a series of communities strung along the eastern shore of the Red Sea, from the Gulf of Akaba in the north to the Emirate of Asir in the south. Almost entirely desert, with no commerce of importance, it largely depends upon the pilgrimages to Mecca and Medina, the sacred places of Islam, which are within its boundaries. The Hejaz railway, built by Sultan Abdul Hamid II., ostensibly to enable pilgrims to get more easily to Mecca, was in reality a means of holding the Arab countries in check. The line joins Damascus to Medina (1320 kms.) and Der'a to Haifa on the coast (161 kms.). Thus Medina is joined to the railway system of Syria. The railway was repeatedly damaged during the War. Hides, coffee, and carpets are exported.

Mecca (q.v.) and Medina (q.v.) are the chief towns, and Jidda is the chief port. The Hejaz has an area of 100,000 sq. m., and a population of about 400,000. See Jacob, *Kings of Arabia* (1924); and Philby, *The Heart of Arabia* (1924).

Hejra. See HEGIRA.

Hekla, or HECLE, a volcanic mountain in Iceland, stands isolated about 20 miles from the south-west coast and 68 miles E. from Reykjavik. Its snow-clad summit is 5102 feet high, and has

five craters. The sides of the mountain are seamed by numerous deep ravines. The principal rocks are lava and tuff. 'Fantastic groups of hills, craters, and lava, leading the eye to distant snow-covered jökuls; the mist rising from a waterfall; lakes embosomed amid bare bleak mountains; an awful and profound slumber; lowering clouds; marks all around of the furious action of the most destructive of the elements, give to the region a character of desolation scarcely to be paralleled.' A record of the eruptions has been kept since the 9th century, during which time there have been twenty outbreaks. These have generally been very violent, and have often continued for a considerable time. In September 1845 a terrific outbreak occurred, and lasted for more than a year. A fine dust from this eruption was scattered over the Orkney Islands, a distance of 500 miles from Hekla. Indeed, the great quantities of fine dust ejected, and the immense distances to which it has been carried, have generally been noted as characteristic of the Icelandic eruptions.

Hel, in Northern Mythology, the goddess of the dead, the sister of the wolf Fenrir, and daughter of the evil-hearted Loki (q.v.), by the giantess Angurboda. The All-father hurled her down into Nifheim, and gave her authority over the lower world, where she received all who died of sickness and old age. She was of fierce aspect, and had a half black, half flesh-coloured skin. To her were assigned the characteristics of insatiable greed and pitilessness. After the introduction and diffusion of Christianity the ideas personified in Hel gradually merged, among all the races of Scandinavian and German descent, in the local conception of a Hell (q.v.), or dark abode of the dead.

Helder, THE, a thriving seaport and strongly-fortified town in the Dutch province of North Holland, 51 miles by rail NNW. of Amsterdam. It stands on the Marsdiep, which connects the Zuider Zee and the German Ocean, and at the northern extremity of the North Holland Canal, by which, too, it has connection with Amsterdam. It is one of the strongest fortresses in Holland, having been first fortified by Napoleon in 1811, and has several naval establishments, including an arsenal and a college, and an excellent harbour. Population, 30,000. Nieuwe Diep, half a mile east, is the port at the main outlet of the North Holland Canal.

Helderberg Formation. In North America a division of the Silurian strata is called (after the Helderberg Range, in the east of New York State) the Lower Helderberg formation. It appears to be on the horizon of the English Ludlow beds. The Upper Helderberg formation of North America is a member of the Lower Devonian strata.

Helen, the most romantic figure of antiquity, famous for her beauty and the misfortunes that followed in her train. She was the daughter of Zeus and Leda, wife of the Spartan king Tyn-dareus, and owed her more than mortal loveliness to her divine origin. At the age of ten she was carried off by Theseus and Pirithous, but was soon recovered by her brothers Castor and Pollux, or whom the latter was half an immortal like herself. She was sought in marriage by all the noblest Greek princes, whom her father bound by an oath to respect the choice which Helen herself should make. She chose Menelaus, and bore to him the fair Hermione. When she was carried off by Paris, son of Priam of Troy, through the connivance of Aphrodite, Menelaus mustered all the Greek princes to revenge the wrong, and thus the famous ten years' Trojan war began. After the death of Paris, not long before the fall of the city, Helen was married to his brother Deiphobus, and she is said to have betrayed him to Menelaus and

so regained her husband's love. With him she returned to Sparta, and there lived the rest of her life in quiet happiness. The pair were at last buried together at Therapnæ in Laconia, although, according to the prophecy of Proteus in the *Odyssey*, they were not to die, but to be translated to Elysium. Another story makes Helen survive Menelaus, and be driven out of the Peloponnesus by his sons. She fled to Rhodes, and was there tied to a tree and strangled by Polyxo—a crime expiated only by the Rhodians building a temple to her, under the name of *Helena Dendritis*. Yet another tradition makes her marry Achilles on the island of Leuce, and bear him a son, Euphorion.

In the Homeric poems Helen survives as the personification of all grace and loveliness. She is the daughter of Zeus, although there is no mention as yet of the swan story of her mother's wooing by the god. Into the conception of her character in the *Iliad* there enters but little sense of moral responsibility, perhaps because she is a personage that has come into history from the world of mythology, which is ever innocent of morals. In the *Odyssey*, again, we find an incipient sense of moral responsibility, the burden of which is, however, shifted from the shoulders of Helen on to those of some god (*Od.* xxiii. 222). It is true, however, that *Iliad* ii. 356 and 590 may fairly be interpreted to convey the meaning that Helen was carried away by force, an unwilling victim of Aphrodite. Still the fact remains that there exists a notable difference of tone about this question, and this is not unfairly advanced as one of their strongest arguments by those who claim a later date for the *Odyssey* than the *Iliad*. Others, again, contend that in the *Iliad* there is a no less distinct sense of moral responsibility, pointing out that in iii. 164 and vi. 357 there is blame distinctly imputed to the gods, and that in iii. 173–176 and vi. 344 Helen takes the burden of the guilt upon herself. Among her warmest apologists are Gladstone and Andrew Lang. Indeed the former makes bold to say that 'her self-abasing and self-renouncing humility come nearer, perhaps, than any other heathen example to the type of Christian penitence.'

Pausanias tells us that on the chest of Cypselus, a work of the 7th century B.C., Menelaus was represented as rushing on to kill Helen; and, according to a statement attributed to Stesichorus, the Achæan host were about to kill her when their hands were stayed by the power of her beauty. In his *Troades* Euripides makes Helen plead her cause to Menelaus with sophistical rhetoric; in the *Helena* he makes her remain in Egypt, the Greeks and Trojans fighting merely for a shadow formed by the gods out of cloud and wind. Again, in his *Cyclops* the giant speaks of Helen in a manner far removed from the high chivalry and tenderness of Priam and of Hector. In the *Æneid* we are invited to behold the hero about to slay Helen crouching in terror in the temple of Vesta, and only saved from this infamy by the interposition of Venus. 'Hundreds of years later,' says Lang, 'Helen found a worthier poet in Quintus Smyrnaeus, who in a later age sang the swan-song of Greek epic minstrelsy.' As the personification of all feminine loveliness, she was conjured up to play a part in the dream of Faust, whose words of wonder at the vision of her beauty in Marlowe's tragedy are almost worthy of their theme:

Was this the face that launched a thousand ships,
And burnt the topless towers of Ilium! . . .
Oh, thou art fairer than the evening air
Clad in the beauty of a thousand stars.

The loves of Faustus and Helen in the second part of Goethe's *Faust* typify the union of the classical and romantic spirit. She is its spiritual heroine

throughout, and by his union with her in the fourth act Faust is raised infinitely rather than degraded in character. Walter Savage Landor in some of the finest lines in his *Hellenics* commemorates the power of her beauty to disarm the anger of Menelaus; and Tennyson has painted for us this 'daughter of the gods, divinely tall and most divinely fair,' in his splendid poem, *A Dream of Fair Women*. E. A. Poe also extols her in one of the finest sonnets in the language.

Helen will remain to posterity what she is in the *Iliad*, one of the most splendid creations in the whole world of art—a queen of beauty supreme over the human imagination, as she was when she went at the summons of Iris, all draped in silvery white, with her three maidens, to the walls of Troy. There above the gate sat the venerable King Priam among his counsellors, and all marvelled greatly at her beauty. 'No marvel is it that Trojans and Achæans suffer long and weary toils for such a woman, so wondrous like to the immortal goddesses' (*Iliad*, iii. 156–158).

See the delightful essay appended to Andrew Lang's fine poem, *Helen of Troy* (1882).

Helena (pronounced, contrary to the classical quantity, *Hel'ena*; as is also the island *St Helena*), capital of Montana, is situated among foot-hills in the Prickly Pear Valley, about 14 miles from the Missouri River, with the Rocky Mountains rising behind the city to the south. It is the commercial and railway centre of the state, connected with the Manitoba and Northern Pacific railways, and by branch-lines with several mining camps. Many of the streets are wide and straight, shaded with rows of cottonwood-trees, and faced with handsome residences and business premises; The most prominent buildings are the state capitol, the county court-house, federal building, cathedral, government assay office, Roman Catholic and Methodist Episcopal colleges, several libraries, besides important power-stations, railway-shops, quartz, flour, and lumber mills. Gold was found here in July 1864, the first log-cabins were erected in September, and the camp was known as Last Chance Gulch until December, when it received its present name. Pop. (1880) 3624; (1920) 12,037.

Hel'ena, the name of several female saints of the Catholic Church, the most celebrated of whom is the Empress Helena, wife of Constantius Chlorus, and mother of Constantine the Great. Born apparently in Bithynia (not in Britain), she seems to have become a Christian during the youth of Constantine, but it was not till after the defeat of Maxentius that she formally received baptism. The few remaining years of her life she gave to works of benevolence. In 326, according to (doubtful) 4th-century tradition, she visited Jerusalem, and there, with Bishop Macarius, discovered the Holy Sepulchre and the Cross (q.v.). Along with it were the crosses of the two thieves, but which was the true cross was shown by its touch restoring a sick woman to health. St Helena died, it is said, a nun, at the age of eighty. Her festival falls on 18th August.—Another Helena, whose cult is confined to the Russian Church, was the wife of the Grand-duke Igor, and at her baptism in Constantinople (955) changed her original name, Olga, into Helena.—A third was a native of West Gothland, and lived in the 12th century.

Helensburgh, a favourite watering-place of Scotland, in Dumbartonshire, is pleasantly situated at the entrance to the Gareloch, 4 miles N. of Greenock by water, and 23 miles NW. of Glasgow. It was founded in 1777 by Sir James Colquhoun, and named after his wife Helen. There is an obelisk to Henry Bell (q.v.). Pop. 10,000.

Helgeland, a name given, from the 10th century onwards, to a district north of Trondhjem, from about 65° N. lat. to near the Svartisen glacier.

Helgoland. See HELIGOLAND.

Heliacal (Gr. *hēlios*, 'the sun'), emerging from the light of the sun or passing into it. A star's *heliacal rising* is when it rises just before the sun.

Héliand, an Old Saxon poem, dating from the 9th century. Its subject is the life and work of Christ, constructed as a harmony of the four gospels. The poem is written in alliterative verse, in the spirit of the old Low German popular poetry. Besides being the most important relic of the Old Saxon tongue, it is not without intrinsic literary merit. Of two extant MSS. (apart from fragments) one is in the British Museum (see Pribsch's study, 1925), the other is at Munich. Heyne issued a critical edition (4th ed. 1905). There is a modern High German translation by Simrock.

Helianthemum. See CISTUS.

Helianthus. See JERUSALEM ARTICHOKE, and SUNFLOWER.

Helicidae (Gr. *helix*, 'a spiral'), a large family of terrestrial air-breathing (pulmonate) gastropods, of which Snails (q.v.) are familiar examples.

Helicon, a mountain-range (5736 feet) in the south-west of Boeotia, in ancient Greece, was celebrated as the favourite seat of the Muses. At the foot of the range stood the village of Ascrea, the residence of Hesiod, and the seat of the earliest school of poetry in Greece. On the slopes were the famous fountains of Aganippe and Hippocrene, whose waters were reputed to give poetic inspiration. But Erasmus as well as Spenser and many of the poets speak of drinking of Helicon as if it were the spring.

Heligoland (Ger. *Helgoland*), a small island in the North Sea, belonging since 1890 to Germany, about 36 miles NW. of the mouth of the Elbe. It is about a mile long from north to south, and one-third of a mile from east to west, and three-fourths of a square mile in superficial area. The *Oberland* is a rock 206 feet in height, to which access is obtained by 192 steps or by a lift; while the *Unterland* is a patch of shore houses south-east of the cliff. The resident population is about 2500; in the bathing season there are many thousands of summer visitors from Hamburg and elsewhere—attracted by the bathing facilities offered by the Sanddüne, a small sandbank with scrubby vegetation, formerly connected by land, but gradually isolated by inroads of the sea. The soil on the flat top of the rock of Heligoland suffices for a little pasture-land, and for growing potatoes and cabbages. There are some sheep on the island, and a few cows. The spit of the Unterland gives partial shelter to two harbours, one to the north, the other to the south. The inhabitants are supported chiefly by the lobster and other fisheries, and by the summer visitors, pilotage having almost ceased, and the public gaming-tables, established in 1830, having been suppressed in 1871. There is practically no poverty, disease, or crime, and the people are very long lived. A lighthouse stands on the cliff near the village. The island, which was taken by the British from the Danes in 1807, and was formally ceded to England in 1814, was ceded to Germany, 1st July 1890, in return for concessions made to Britain in East Africa. Heligolandish, a dialect of North Frisian, is the native tongue, but German is currently spoken.—Heligoland was anciently sacred to Forseti, son of Balder. Some identify it with the island of the goddess Nerthus. According to tradition, the island was once vastly larger, great tracts of country having been swallowed up by the sea between 700 A.D. and the end

of the 17th century; and indeed it is still shrinking rapidly owing to the disintegrating work of sea and weather. Christianity was first preached here by St Willibrord in the end of the 7th century. The inhabitants of Heligoland are divided into two classes. The first are Frisians, a tall and muscular race of hardy seamen, simple and primitive in their habits, and holding land-labour and soldiers in contempt. The merchant class consists of immigrants from Hamburg and other places on the mainland, or their descendants. There is a curious and picturesque church, on the roof of which is still the Dannebrog painted by the Danish authorities when the island belonged to Denmark. The people, though they had been very loyal to Great Britain, accepted the annexation to Germany; and the island was incorporated with the Prussian province of Sleswick-Holstein. The Germans made a well-nigh impregnable fortress of Heligoland; honeycombed it with passages with walls of iron-concrete 50 feet thick, reaching, some of them, 100 feet below sea-level; and built a naval harbour which, filled with submarines, proved a very useful base in the Great War. After the Treaty of Versailles Heligoland's fortifications were demolished (1920–22). The island enjoys a considerable measure of autonomy. See Black's *Heligoland* (1888); German books by Lindemann (1889), Lipsius (1892), Tittel (1894), and A. W. F. Müller (1904); and H. Gätke, *Heligoland as an Ornithological Observatory* (trans. 1895).

Heligoland Fight, a naval battle fought off Heligoland on 28th August 1914, which was a severe blow to the German fleet. The original plan only included a sweep with destroyers and submarines supported by two cruisers, but Admiral Beatty with the battle-cruiser squadron and the 1st light-cruiser squadron was sent to co-operate, and the result of the engagement was a defeat to the German forces. They lost three light cruisers and one destroyer, and their total casualties were 1242, compared with the British 75. As a result of this action the German fleet was limited to a strictly defensive policy. The battle came at an opportune moment, giving the nation faith in the power of the navy to deal with its great task, while it also gave the navy trust in its leaders. The action ranks as one of the most important in the War. See TACTICS, and WAR (GREAT).

Heliocentric, in Astronomy, having the sun's centre (Gr. *hēlios*) as centre of reference; the heliocentric place of a planet being opposed to its *geocentric* (Gr. *gē*, 'earth'), its place as seen from the earth's centre.

Heliodorus, the earliest and best of the Greek romance writers, was born at Emesa, in Syria. He was a sophist of the second half of the 3d century A.D., but has sometimes been confounded with a bishop of Trikka, in Thessaly (circa 390). The work by which he is known is entitled *Æthiopica*, in ten books, narrating in poetic prose, at times with almost epic beauty and simplicity, the loves of Theagenes and Chariclea. The work is distinguished from the later Greek romances by its vigour and its pure morality. Thomas Underdown's translation (1587; new ed. 1924) was revised by F. A. Wright (1923).

Heliogabalus, or ELAGABALUS, emperor of Rome, was born at Emesa in 204 A.D. His real name was Varius Avitus Bassianus, but having, when a mere child, been appointed high-priest of the Syro-Phœnician sun-god Elagabal, he assumed the name of that deity. Soon after the death of his cousin Caracalla, Heliogabalus was proclaimed emperor by the soldiers, in opposition to the legitimate sovereign, Macrinus, who had become obnoxious to the troops from his parsimony and the

severity of his discipline. The rivals met in battle on the borders of Syria and Phoenicia in 218 A.D. Macrinus was defeated, and Heliogabalus, proceeding to Rome, quietly assumed the purple. His reign, which lasted rather more than three years and nine months, was infamous for the gluttony and the nearly unparalleled debaucheries of every kind in which he indulged. He was murdered in an insurrection of the prætorians in 222 A.D., and was succeeded by his cousin and adopted son, Alexander Severus. See Stuart Hay, *The Amazing Emperor Heliogabalus* (1911).

Heliography, a method of communicating swiftly between distant points by means of the sun's rays reflected from mirrors. Either successive flashes or obscurations of a continuous reflection of the sun's light may be combined so as to read like Morse's telegraphic system (see TELEGRAPH). Heliography may be used for geodetic measurement, or for military and other signalling. The instruments which contain the mirrors are variously called *heliograph* and *heliostat*. Under exceptionally favourable conditions heliography can be successfully practised over distances up to 200 miles or so. As early as the 11th century A.D. Algeria possessed a system of heliographs: 'At the summit of this tower was an apparatus of mirrors, corresponding to similar ones established in different directions, by aid of which one could communicate rapidly with all the towns from one end of the empire to the other.' About 1880 heliography (now largely superseded by field telegraphs and telephones) came much into use in army signalling. The name *heliostat* was originally used of an Equatorial (q.v.) revolving on its polar axis.—*Heliotrope* was the name given to a mirror placed at the distant station, and adjusted by clockwork, so that at a particular hour of the day (arranged beforehand) the light of the sun shall be reflected from the mirror directly to the surveyor's station. See SIGNALLING.

Heliogravure. See PHOTOGRAVURE.

Heliometer ('sun-measurer') is an instrument invented by Savary and Bouguer in 1743-48, by means of which the diameters of the heavenly bodies can be measured with great accuracy. As improved by Dollond, the object-lens of the instrument is in two halves, each of which will form a perfect image in the focus of the eyepiece; and the images may be made to diverge, coincide, or overlap each other, by varying the distance between the half-lenses. If the diameter of the sun is to be measured, the two lenses are adjusted so that the images may touch each other; then the distance between the centres of the two object-glasses measured in seconds gives the diameter of the sun. Fraunhofer made many remarkable improvements on the heliometer.

Heliopolis ('city of the sun'), the Greek name of the city called by the Egyptians On, An, which stood on the east side of the Pelusiac branch of the Nile, near the apex of the Delta, and was one of the most ancient and important of Egyptian cities. It was the chief seat of the wisdom of the Egyptians, and Thales, Plato, and Solon are reported to have learnt from its priests. Manetho, the historiographer of Egypt, was chief-priest here, an office filled centuries earlier by the father-in-law of the Hebrew Joseph. One of the red granite obelisks long famous as Pharaoh's Needles is still standing near the hamlet of Matariéh, 8 miles N. of Cairo. It is 70 feet high, and bears the name of Usurtesen I., the second king of the twelfth dynasty. The obelisk called 'Cleopatra's needle,' brought in 1878 to England, and others in Rome and New York, were originally brought to Alexandria from this city. See SUN-CULT, IMAGES. For the Syrian Heliopolis, see BAALBEK.

Helios, the Greek name of the sun (the Roman *Sol*), who was worshipped as a god. According to Homer, he was a son of the Titan Hyperion and of Theia, and a brother of Selene or Eos. He is described by the same poet as giving light both to gods and men. He rises in the east, from the marshy borders of Oceanus, into whose dark abysses he also sinks at evening. The later poets, however, gave him a splendid palace in the east, somewhere below Colchis, and describe him as being conveyed, after the termination of the burning labours of the day, in a winged boat of gold, along the northern coasts of the sea back to Colchis. After the time of Æschylus, he began to be identified with Apollo or Phœbus, but the identification was never complete. His worship was widely spread. He had temples in Corinth, Argos, Trozene, Elis, and many other cities, but his principal seat was Rhodes, where a four-team was annually sacrificed to him. The island of Trinacria (Sicily) was also sacred to Helios, and here his daughters, Phœtusa and Lampetia, kept his flocks of sheep and oxen. It was customary to offer up white lambs or boars on his altars. The animals sacred to him were horses, wolves, cocks, and eagles.

Helioscope, a telescope for observing the sun without injury to the eyes, by means of blackened glass or mirrors that reflect only a part of the light.

Heliotrope (*Heliotropium*), a genus of plants of the natural order Boraginæ (q.v.); of the section *Heliotropioidæ* or *Heliotropiæ*, the fruit separating only when ripe into four carpels. Many of the species have fragrant flowers. The Peruvian Heliotrope (*H. peruvianum*), a shrub with oblong-lanceolate wrinkled leaves and small lilac-blue

Common Heliotrope (*Heliotropium Europæum*).

flowers, is in almost universal cultivation for its fragrance, which resembles that of vanilla or cherry-pie. Many seminal varieties of this species are cultivated in gardens. They delight in rich light soil, and are propagated by cuttings of the young growing shoots in a moist warm atmosphere. The European or Common Heliotrope (*H. europæum*), a native of the south and west of Europe, is an annual with small white, or rarely pale red, flowers, much used by perfumers.—The so-called Winter Heliotrope (*Petasites fragrans*) is a composite plant, akin to the Butter-bur (q.v.), with flowers whose smell suggests heliotrope. It grows and spreads with great luxuriance in waste places. Clytie was fabled to have been turned into a heliotrope through gazing at Apollo.

Heliotrope, or BLOODSTONE, a variety of chalcedony or of jasper, of a green colour with red spots. The finest heliotropes consist of chalcedony, and are translucent, at least at the edges; the jasper bloodstones are opaque. Heliotrope is found in many parts of the world, as in Scotland, but the finest specimens of this mineral are brought from the southern parts of Asia. It was well known to the ancients, who obtained it chiefly from Ethiopia and Cyprus. It is much used for boxes, seals, &c.; and those specimens are most valued which possess most translucency, and in which the red spots are bright and well distributed. It was much used in the early ages of the Christian church for the engraving of sacred subjects, the figures being so managed that the red spots should represent drops of blood. The name heliotrope (Gr. *hēlios*, 'the sun'; *trōpē*, 'a turning') seems to have been given to this mineral because when immersed in water in the face of the sun it was said to make the image of that luminary in it appear of a blood-red colour. The heliotrope, thus described by Pliny, must have shown very large spots or veins of red.

Heliotrope, an instrument. See HELIOGRAPHY.

Heliotropism ('turning towards the sun'). When a seedling plant is placed in a transparent vessel of water within reach of the light of a window, the stem and leaves gradually bend towards, and the roots from, the light. The former phenomenon is termed *positive*, and the latter *negative*, heliotropism. The shoots and leaves of nearly all plants turn towards the light, and the turning of the sunflower towards the sun is familiar to every one. In the case of organs which are positively heliotropic the growth of the side next the light is retarded, and that of the opposite side increased; the result of these combined actions is a concavity on the former, and a convexity on the latter, thus causing a curvature towards the light. In the case of roots these actions are reversed. That these results are brought about by the action of light is evident; the cells on the concave side become less, while those on the convex side become more, turgid, thus forcing the organ to bend; but the cause of turgescence is unknown.

Heliochrome. See PHOTOGRAPHY.

Heliozoa, or 'sun-animalcules,' a class of Protozoa of the Rhizopod type—i.e. provided with protruding processes of living matter. These processes are unlike those of the Amœbæ (q.v.) in being slender and radiate, unlike those of Foraminifera (q.v.) in having a stiff axial thread and in not interlacing. The cell of which the Heliozoon consists is spherical, with one nucleus or with many, and usually with vacuoles both contractile and non-contractile. There is sometimes a siliceous skeleton, either continuous or composed of loose spicules. Multiplication is effected by division of the cell into two, or by budding, or by spore-formation. In some cases the spores are flagellate. Conjugation also occurs. The majority live in fresh water, but some are marine. Common examples are Actinosphaerium, Actinophrys, Raphidiophrys, and Clathrulina. See PROTOZOA, and the *Cambridge Natural History*, vol. i.

Helium, a chemical element (He; atomic number, 2) of the Argon family. Exceeded in lightness by hydrogen alone, it is much to be preferred to that inflammable and explosive gas for airship purposes, since it is chemically quite inert. The Great War greatly stimulated development in this direction, and it is produced commercially from natural gases at Fort Worth, Texas, and elsewhere along a belt extending from Texas to Pennsylvania and New York. For its properties and the history of its discovery see ARGON, RADIUM, SUN.

Helix (Gr., 'a snail'), a term used for a genus of molluscs (see SNAIL); for part of the human ear (see EAR); and for a small volute or twist in the capital of a Corinthian column.

Hell. The word seems in its origin to be connected with German forms *hehlen*, 'to hide,' and *hühlen*, 'to cover,' and perhaps with the Latin *celare*. In Old English it denoted the realm of the dead in general, the hidden, unseen region into which the soul is ushered after death; and hence, when the Authorised Version was made, it was quite a correct and appropriate rendering for the Hebrew term 'Sheol.' In modern usage, however, the meaning of the word has been narrowed down to the place or condition in which punishment is exacted after death for the sins committed during the present life.

The belief in hell, therefore, is almost always the corollary of the doctrine of a future life. It inevitably arises as soon as moral distinctions are introduced into the conception of immortality. The idea of hell assumes different forms in different religions. In Scandinavian mythology, for instance, the wicked are banished after death to Nastrand, 'the strand of corpses, a vast dwelling made of serpents wadded together, their fangs dropping torments of venom, in which the spirits must plunge for ever.' In the eschatology of Persia, according to the teaching of the Zend-Avesta, all souls are compelled after death to cross the bridge Chinvan, and when the wicked approach it they are met by an ugly hag, who proves a false guide, and they fall from the bridge into the yawning gulf below, the hell of Ahriman and his demons, who torture the souls of sinners in this gloomy prison. Tartarus, the hell of the Greeks, is described by Plato in the *Phædo* and the *Republic*. It is a vast chasm, which pierces right through the interior of the earth. Into it the two rivers, Cocytus and Pyriphlegethon, flow, and form the channels of approach. Two classes of souls, according to Plato, are thrown into Tartarus. 'Those who appear to be incurable by reason of the greatness of their crimes . . . are hurled into Tartarus, which is their suitable destiny, and never come out. Those, again, who have committed crimes which, though great, are not irremediable, . . . are plunged into Tartarus, the pains of which they are compelled to undergo, but at the end of a year the wave casts them forth—mere homicides by way of Cocytus, parricides and matricides by Pyriphlegethon—and they are borne to the Acherusian lake, and there they lift up their voices and call upon the victims whom they have slain or wronged to have pity on them' (*Phædo*, 114).

The idea of hell, therefore, is not peculiar to Christianity; it is a conception which it shares with most other forms of religion. As a matter of fact, it seems to have grown up much more slowly in connection with the religion of Israel than in the case of most other forms of faith. It is very questionable, for instance, whether the idea of hell in the technical sense of the term is to be found in the Old Testament; if it is, it is certainly confined to the latest books. Our Authorised English Version is very misleading in this respect, and its mistake has been very largely perpetuated in the Revised Version. On thirty-one occasions the Authorised Version uses the word 'hell' in the Old English sense of the term, as the abode of the dead, to render the Hebrew 'Sheol,' which, speaking generally, never means the place of punishment, but always signifies the shadowy underworld into which all classes of souls, irrespective of any moral distinctions, go immediately after death. If proof is needed that the Old Testament translators intended the word 'hell' to be interpreted in the sense in which it was used by Chaucer and Spenser,

and early English writers generally, it can be found in the fact that on an equal number of other occasions (thirty-one) our translators render Sheol by 'the grave,' and in a few other cases by 'the pit,' thus showing that in their terminology hell and the grave are equated terms.

But though the idea of hell is absent from the Old Testament till we reach the latest books, there seems to be an adumbration of it in a few passages in the Psalms and Prophets. In Ps. xvi. 10 and xlix. 15, 16, it is suggested that the righteous may be rescued from Sheol, while the wicked are left in its power to be consumed. This belief, of course, transforms Sheol itself into a kind of hell. In most of the other passages which deal with the working of the law of retribution, the punishment is exacted during the present life in this world (cf. Isa. l. 11; lxvi. 24). There may be possibly a belief in hell implied in Isa. xxiv. 11, where the wicked are described 'as gathered in the pit' (i.e. Sheol) and shut up in the prison; but it must be remembered that this particular chapter belongs to a group of prophecies which most modern scholars allocate to the 4th century B.C. The only clear and indisputable statement is in Dan. xii. 2: 'And many of them that sleep in the dust shall awake, some to everlasting life and some to shame and everlasting contempt.' The absence of the conception from the Old Testament is due to the fact that belief in the future life (of which the doctrine of hell is the correlative) was of late origin in Jewish thought, and only became a vivid reality towards the end of Old Testament times.

The conception of hell is essentially the creation of the intermediate period between the Old Testament and the New Testament (170 B.C.-1 A.D.). It is obvious that directly the position of Dan. xii. 2 was reached, Sheol must be supplemented by heaven or paradise on the one side and hell on the other, and during the two centuries preceding the Christian era the imagination of Jewish teachers and seers was focused on this particular point. The idea of Gehenna was evolved. The imagery upon which it was based is familiar to readers of the Old Testament. The word Gehenna signifies 'the valley of Hinnom,' a valley near Jerusalem, which, in the earlier period of Israel's history, was the scene of most degrading idolatry and inhuman sacrifice (2 Kings, xvi. 3; xxi. 6). In later times it was the place where rebellious or apostate Jews were executed and their bodies cast into the fires. There is a clear reference to this practice in Isa. lxvi. 24: 'They shall look upon the carcases of the men that have transgressed against me, for their worm shall not die, neither shall their fire be quenched; and they shall be an abhorrence unto all flesh.' The Jewish idea of hell is the valley of Hinnom transferred to an eternal plane.

The following passages may be cited as illustrating the rapid development of the belief in hell in apocryphal and apocalyptic literature. In the *Book of Enoch* the fate of the wicked is described in the following words: 'As straw in fire shall they burn before the face of the holy; 'in blazing flames burning worse than fire shall you burn' (xlvi. 9; c. 9). In the *Assumption of Moses*, as in certain forms of later Christian theology, the sufferings of the wicked in Gehenna are made to enhance the joys of the righteous in heaven. 'And thou shalt look from on high and shall see thy enemies in Gehenna, and thou shalt recognise them and rejoice, and thou shalt give thanks and confess thy Creator' (x. 10). In *Judith* we read: 'Woe to the nations that rise up against my race. The Lord Almighty will take vengeance upon them in the day of judgment and put fire and worms in their flesh, and they shall weep and feel pain for ever.' In the *Fourth Book of Maccabees*

we are told that 'a great struggle and peril of soul awaits in eternal torment those who transgress the ordinance of God' (xiii. 15). Elsewhere in the same book the doom of the sinner is described as 'torment by fire for ever' (ix. 9; x. 11), and similar words are used in the *Apocalypse of Baruch* (lix. 2). In 4 *Ezra*, hell is called 'the pit of torment' and 'the furnace of Gehenna' (vii. 36), and a terrible picture of its horrors is drawn in the *Book of the Secrets of Enoch*: 'Two men led me up on to the northern side and showed me there a very terrible place; and there were all manner of tortures in that place: cruel darkness and unilluminated gloom, and there is no light there, but murky fire constantly flameth aloft; and there is a fiery river coming forth, and the whole place is everywhere fire, and everywhere there is frost and ice, thirst and shivering, while the bonds are very cruel and the angels fearful and merciless, bearing angry weapons and merciless torture' (x. 1-3). The author of the last-mentioned book locates hell in the second of the seven heavens: 'They led me up to the second heaven and showed me darkness greater than earthly darkness, and there I saw prisoners hanging awaiting the great and boundless judgment' (vii. 1-3). In another passage, however, he seems to accept the common Jewish theory, which places hell in the underworld: 'I was led downward to the very lowest hell and the judgment place and the very great open and weeping hell' (xl. 12). Very possibly the writer of the book had at the back of his mind an idea of a series of hells answering to the seven heavens, and this may be the meaning of the phrase 'lowest hell' in the passage just cited.

The evidence which has just been adduced proves how strongly the idea of hell and future punishment had taken possession of the Jewish mind during the hundred and fifty years that preceded the Christian era. It is found in all the literature of the period except in 1 *Maccabees*, the *Book of Jubilees*, and, of course, *Ecclesiasticus*, its absence being due in most cases to the fact that these books contain no clear belief in a future life at all. Many scholars think the rapid development of this conception in Jewish thought was due to influence of Persian dualism.

When Jesus began to teach he found the thought of the day saturated with the belief in hell and future punishment, and there can be little doubt that in the realm of eschatology he adopted the current conceptions of his age. An attempt is sometimes made to prove that these ideas are not part of the original teaching of Jesus, but later accretions inserted into the records by tradition under the influence of the atmosphere of the time. This position, however, cannot be maintained, in view of the fact that our earliest sources contain most certain proof that these doctrines are an integral part of the teaching of Jesus. The evidence of Q (one of the sources used by Matthew and Luke; see GOSPELS) and Mark is unmistakable upon the point. We have no data to prove that these doctrines were absent from the teaching of Jesus. The conception of hell in the gospels reproduces all the characteristics that mark the prevailing belief of the time upon this subject. 'The angels shall sever the wicked from among the righteous, and shall cast them into the furnace of fire, and there shall be the weeping and the gnashing of teeth' (Matt. xiii. 42, 50). 'It is good for thee to enter into life maimed rather than having thy two hands to go into hell, into the unquenchable fire, . . . where their worm dieth not, and the fire is not quenched' (Mark ix. 43, 48). 'Depart from me, ye cursed, into the eternal fire which is prepared for the devil and his angels. . . . And these shall go away into eternal punishment,

but the righteous into eternal life' (Matt. xxv. 41-46). On other occasions the metaphor is changed, and 'the outer darkness' is substituted for 'the fire.' 'Cast ye the unprofitable servant into the outer darkness' (Matt. viii. 12; cf. Matt. xxii. 13; xxv. 30).

It is a remarkable fact that when we pass from the synoptic gospels into the region of Pauline and Johannine thought the belief in hell, at least in the popular Jewish conception of the term, falls into the background, and very little trace is to be found of it at all. This is all the more significant, because Paul was schooled in Jewish thought, and thoroughly well versed in apocalyptic literature. There seems to be only one passage in all the Pauline epistles into which the idea of hell can be read, and even here there is no absolute certainty. 'Unto them that obey not the truth . . . shall be wrath and indignation, tribulation and anguish, upon every soul of man that worketh evil' (Rom. ii. 8, 9). The working of the law of retribution is described under spiritual and not material categories. Paul spoke constantly of spiritual death and perdition, never once of 'everlasting fire.' It has been suggested that this change of attitude was due to the fact that he was writing to Gentiles, to whom the terminology of apocalyptic was unfamiliar. But this argument is not conclusive, because in Galatians and part of Romans Paul is speaking directly to Jews, and, moreover, as we have already seen, the idea of hell in the Platonic sense of the term was quite as well known in Greek as in Jewish thought. Dr J. H. Leckie, in his Kerr Lecture on *The World to Come and Final Destiny*, makes the daring suggestion that Paul wished to dissociate himself from the traditional version of the teaching of Jesus upon this point. 'Why, then, had Paul nothing to say regarding the pit of fire and destruction? Most likely because he did not wish to teach or believe that Jesus had meant to enforce the idea of perpetual torment.'

In the Book of Revelation, however, as we should naturally expect, the thought of the Church returned to the apocalyptic conception of hell. Hell is described as 'the lake of fire and brimstone' (xx. 10); and the doom of the wicked is portrayed in the awful words of xiv. 10-11: 'He shall drink of the wine of the wrath of God, which is prepared unmixed in the cup of his anger, and he shall be tormented with fire and brimstone, . . . and the smoke of their torment goeth up for ever and ever.'

It was reserved, however, for a later Christian Apocalypse—the so-called Apocalypse of Peter—a considerable fragment of which was discovered in 1892, to fill in the details of the picture of hell, and leave no path that was open to the imagination untraversed in its attempt to depict the horrors of eternal torture. The Apocalypse of Peter is the basis of the *Inferno* literature which has grown up around the conception of hell. The fragment is too long to quote in its entirety, but some citations must be given in order to display the character of this remarkable document.

Hell is described as a 'very squalid place,' in which there was 'a lake full of flaming mire.' An attempt is made to discriminate between different forms of sin, and so make the punishment fit the crime. Murderers, for instance, were cast into a certain narrow place full of reptiles, being smitten by those beasts, and wallowing thus in that torment. Persecutors of the Church are described as 'on fire up to their middle, and cast into a dark place, and scourged by evil spirits, having their entrails devoured by worms that never rest.' False witnesses spend their time 'gnawing their tongues, having flaming fire in their mouths.' The selfish rich are to be seen 'rolling about on pebbles sharper than swords, and red-hot.' Usurers stand up to their

knees 'in a great lake full of pitch and blood and boiling mire.' Immoral men are 'hurled down from a great cliff,' and then forced to ascend again, that the process may be repeated *ad infinitum*. The fragment ends with the significant words: 'Others again, women and men, were burning and turning themselves, and being roasted, and these were they that had forsaken the way of God.' This picture of hell passed from the Apocalypse of Peter into the Apocalypse of Paul, which dates from the latter end of the 4th century, and which seems to have formed the immediate source from which Dante drew most of his material for his *Paradiso* and *Inferno*.

From the New Testament and the Apocalypses the belief in the eternal punishment of the wicked passed into the theology of the Church. With but few exceptions the Fathers of the ancient Church were unanimous in the belief that a man's eternal destiny is irrevocably settled in this life, and that after death endless punishment awaits the sinner amid the tortures of hell. Cyprian, who may be quoted as representative of the general opinion of the Church, writes: 'An ever-blazing hell and savage punishment will burn up the sinners in undying flames, and there will be no means by which their tortures will be able to find respite or an end.' The popular belief in eternal punishment was turned into a theological dogma by Augustine, and after his day for many centuries was regarded as an *articulus stantis vel cadentis ecclesiae*. In the middle ages theologians, preachers, poets, and artists vied with each other in elaborating and making vivid to the imagination of the world the tortures of hell. Dante's *Inferno*, with its despairful inscription over the infernal gate, 'All hope abandon ye who enter here,' only reflects the common theology of the time. Mediaeval painters like Orcagna devoted all the wealth of a grotesque imagination to the portrayal of its material torments, and the famous fresco in the Campo Santo at Pisa shows what a really great artist could make of such a theme. What Dante did for Italian thought, Milton did for British. The *Paradise Lost* probably did far more than the theologians and the preachers to fasten the conception of hell on the English mind. Milton, it will be remembered, combined the torments of the Greek Tartarus and the Christian hell, in order to make the horrors of the picture more lurid and realistic. To quote Stopford Brooke's description: 'Milton's Hell lies in the depths of Chaos, a fall of nine days and nights from Heaven. In its midst, and it is conceived as circular, is the bottomless lake of fire, into which pour the four rivers, Acheron, Phlegethon, Styx, and Cocytus. Around the lake a vast space of dry land extends, formed of solid fire, in one of whose hills Pandemonium was formed entire, and, when formed, rose out of it like an exhalation. The city of Hell is afterwards built round Pandemonium on this dry ground of fire, and the country round the city is broken with rock and valley and hill and plain. Further on, in another concentric band, we catch a glimpse of a desert land, seemingly moist, but giving no relief. After that is the realm of cold.

Beyond this flood a frozen continent
Lies dark and wild, beat with perpetual storms
Of whirlwind and dire hail.

. . . Over all is the concave vault of fire.'

It ought to be mentioned that, in spite of the widespread belief in hell, no statement of the doctrine appears in any of the early Christian creeds. The first allusion to it is found in the *Quicumque Vult*. In Protestant Confessions of Faith, the doctrine is found in the Augsburg (1530) and Westminster (1646-47) Confessions, but not in the

Thirty-Nine Articles of the Church of England (1563), or the Sixty-Seven Articles of Zurich. The last-named simply affirms 'that the judgment of the deceased is known to God alone.'

But though the belief in hell has always been regarded as one of the primary doctrines of Christianity, we find that in every age vigorous protests have been made against the doctrine. The revolt has taken two forms, and two substitutes have been suggested to take the place of the orthodox view: (1) Universalism, or the belief in the final salvation of all men; (2) Conditional Immortality, or the belief that sinners perish utterly at death or, at any rate, at the judgment.

I. The Universalist theory has been in existence from the early days of Christianity. The possibility of an escape from Tartarus was, as we have seen, an essential element in the teaching of Plato, and wherever the influence of Platonism made itself felt in Christian thought, it always modified the orthodox belief in eternal punishment. In the second part of the *Book of Wisdom*, for instance, the position is clearly laid down that the purpose of punishment should always be remedial and not retributive, and on such a theory, of course, the idea of endless torture in hell is impossible. In later Jewish thought, as Volz has shown in his *Jüdische Eschatologie*, the doctrine of eternal punishment was gradually softened down. Akiba, for instance, maintained that the punishment of sinners in hell would only last twelve months, while his contemporary and rival, Jochanan ben Nari, declared that it would only extend from Passover to Pentecost (see Leckie, p. 142). The first great Christian writer to formulate the Universalist position was Origen, though in some particulars he may possibly have been anticipated by Irenæus and Clement of Alexandria; in fact, Leckie maintains that 'it is certain that from the time of St Paul there were forces at work in the speculation of the Church which found their logical culmination in the teaching of Origen' (p. 254). Origen believed that ultimately all men would be saved, and that the punishment of hell was purgatorial in its effect; and that, when this end was secured, the punishment would cease for all, most probably even for evil spirits as well as men, and that the duration of the suffering would be proportioned to the guilt of the individual and the length of time needed for the remedial process. Origen's views received warm advocacy from two of the greatest teachers of the 4th century—Gregory of Nyssa and Theodore of Mopsuestia. Gregory paints a glowing picture of a coming age when 'there shall no longer be a sinner in the universe, and the war between good and evil shall be ended.' He regards hell as a purifying furnace which melts the dross from the gold 'until the spurious alloy is consumed and annihilated.' Theodore of Mopsuestia teaches that in the world to come 'those who have done evil will be made worthy of the sweetness of the divine favour. For never would Christ have said, "until thou hast paid the last farthing," unless it were possible for us to be cleansed when we had paid the penalty.' The extent to which Universalism prevailed in the 4th and 5th centuries can be surmised from (1) the long arguments which Augustine devotes to the condemnation of the theory; (2) the attacks on the theory by the Synod of Carthage and other councils of the Church. Under the influence of these criticisms the movement seems to have waned until it was awakened into new life by John Scotus Erigena in the 9th century. From Scotus Erigena the belief in Universalism passed over into Mysticism, and found expression in the writings of men like Eckhart and Tauler. In more modern times there has been a great succession of advocates of the Universalist position—including theologians like

Bengel, Rothe, Neander, Tholuck, Schleiermacher, Maurice, Erskine of Linlathen, and Martineau; poets like Tennyson, Browning, and Whittier; expositors like Alford, Plumptre, and Cox; preachers like Kingsley, Farrar, and Stopford Brooke.

The grounds upon which the Universalist position rests may be stated as follows: (1) The orthodox doctrine is wrong in assuming that the New Testament teaching is unanimously in favour of eternal punishment. The word translated 'eternal' (*aiónios*) need not necessarily mean everlasting. Originally the word signified 'belonging to the age to come,' and eternal is only a secondary and derivative meaning, since it came in course of time to be assumed that the 'age to come' was of everlasting duration. In the *Book of Enoch* (x. 10), for instance, the phrase 'eternal life' is used to denote a fixed period of 500 years, and on another occasion the phrase usually translated 'for ever' covers a period of seventy generations (x. 5). The reply of Augustine that, if we limit the meaning of the word in the case of punishment, we must limit it also in the case of reward, and so rob the idea of future blessedness of its everlastingness, is not necessarily valid, because there are other considerations which weigh on one side of the equation, but are absent on the other. There are some statements in the teaching of Jesus which seem to imply the possibility of moral change in the after-life. Jesus certainly teaches that there are degrees of punishment in hell. Some are to be beaten with few stripes, others with many (Luke, xii. 47, 48). 'It shall be more tolerable for Sodom and Gomorrah.' It is very difficult to reconcile this conception with the belief in eternal perdition. Again, of one type of sin—and one type only—Jesus says, 'It shall not be forgiven, neither in this world nor in that which is to come.' As Charles says, 'such a statement would not only be meaningless, but also misleading in the highest degree, if in the next life forgiveness were a thing impossible.' The saying in the Sermon on the Mount, 'thou shalt by no means come out till thou hast paid the last farthing' (Matt. v. 26), points in the same direction.

Moreover, there is the striking fact which has already been mentioned, that the conception of hell is entirely absent from the theology of St Paul. Then, again, it is quite impossible to evade the force of the references in 1 Peter to the descent of Christ into Hades. The statements are quite explicit. 'He went and preached unto the spirits in prison' (iii. 19); 'the gospel was preached even to the dead' (iv. 6). There was no question as to the correct interpretation of these words in the ancient Church. The doctrine of the descent into Hades is taught in the early creeds, and finds a place in the writings of Ignatius, Hermas, Justin Martyr, Irenæus, Tertullian, Clement of Alexandria, Origen, Cyprian, Cyril, Ambrose, Augustine, and Chrysostom. Justin and Irenæus quote an interesting parallel from the Old Testament, which is supposed to have been originally found in the prophet Jeremiah, though it was afterwards excised by the Jews. 'The Lord God remembered the dead who had fallen asleep, and went down to them to preach his salvation to them.' The narrative of the descent of Christ into Hades was afterwards elaborated in the apocryphal gospel of Nicodemus. In the light of this testimony we cannot accept any of the modern attempts to eviscerate the force of the statements in 1 Peter. We cannot say with Calvin that the descent into Hades simply refers to the terrible anguish with which the soul of Christ was tried after his death, equalling in its intensity for the time the sufferings of the damned, nor yet with Pearson and some other modern commentators that the phrase simply alludes to the fact that our Lord, by means of the Holy Spirit, spoke through

Noah to the disobedient antediluvians who are now imprisoned in hell for their sins.

On the whole, then, we are bound to admit that the testimony of the New Testament is divided. If there is much in it that seems to support the doctrine of eternal punishment in hell, there is much, on the other hand, that certainly favours a milder view, and suggests that the sinner may have a second chance in another life.

(2) Secondly, there are facts in human experience which it seems very difficult to square with the theory that a man's eternal destiny is settled once and for all in the present life. Even in so-called Christian countries there are masses of people who, to quote General Booth's phrase, 'are not so much born into the world as damned into it,' because they are born amidst conditions which seriously handicap them for a life of virtue. Then there are the teeming millions in pagan lands, who have never had the opportunity of hearing the Christian gospel. The mind recoils from the thought of their eternal damnation. Even the most thoroughgoing advocates of the orthodox view have felt themselves compelled to make concessions in such cases as these. Dr Pusey, for instance, though he is unwavering in his belief in eternal punishment, says that the heathen both at home and abroad will be judged according to their own standards of good and evil, and if they have any goodness in them at all will receive the benefits of Christ's redemption, and only those who 'obstinately at the end and to the end reject God' will be finally lost.

(3) The Christian conception of God is very difficult to reconcile with the theory of unending torment. As Leckie puts it, 'When we think of the *divine character* we see that it is love: and infinite love has infinite power to save and to reconcile. When we consider the *freedom of the human will* we see that it is limited by the nature of things, by the moral necessity that good should prove itself stronger than evil. When we reflect on the *nature of evil* we see that it is transitory, carries in it the seeds of its own destruction, has no place among immortal things. Finally, when we think of God as *having a purpose*, we see this purpose is universal, and must in the end prevail.'

(4) In the same way a true ethical ideal involves the possibility of moral restoration. To quote the words of Charles, 'If we appeal to the science of ethics, which finds its perfect realisation in Christianity, the idea that forgiveness is impossible in the next life has only to be stated to be rejected: for till absolute fixity of character is reached, repentance and forgiveness, being moral acts, must be possible under a perfectly moral Being.'

II. The second form which the revolt against the orthodox belief in hell has assumed is what is known as the theory of Conditional Immortality. This theory assumes that only the righteous inherit eternal life; for the wicked, death is the end of everything. Immortality is not a native endowment of human life: it is the reward for virtue, and particularly the boon conferred on mankind by the Christian religion. Some traces of this doctrine are to be found in Jewish thought. The teaching of Philo is ambiguous, but he certainly at times makes use of phrases which seem to imply that he believed in conditional immortality. When he speaks, for instance, of 'piety' as 'that by which the mind attains to immortality,' or of 'philosophy' as 'that by which mortal man becomes immortal,' he employs language which approximates at any rate to this theory. There are statements, too, in the first half of the *Book of Wisdom* which seem to indicate the same belief. It is often asserted that this doctrine is an essential implicate of the Pauline and Johannine systems of

theology, but such an assertion cannot be absolutely proved. There are elements in the teaching of Justin, Tatian, and Irenæus which seem to suggest that these fathers accepted the doctrine of the annihilation of the wicked. But it is in the writings of Arnobius that the belief finds its first clear dogmatic expression, though his position seems to have won few supporters in the early centuries. At the time of the Reformation, however, the theory received a new impetus. It was adopted by the Socinians, and is formally stated in the *Racovian Catechism*, the earliest Socinian Confession of Faith. It appealed to theologians like Jeremy Taylor and Tillotson, both of whom tried to prove its consistency with the historic Christian faith. In modern times it has, as Leckie has pointed out, assumed four forms. (1) The scientific and evolutionary form, which finds its best expression in M. Armand Sabatier's brilliant *Essai sur l'Immortalité*. Every living thing, according to this theory, is a bundle of cosmic elements endowed with the principles of life and spirit. The higher the personality, the more these cosmic germ-cells are organised and harmonised, and when perfect harmony and coherence are attained, the personality becomes endowed with immortality. Religion and morality are the great factors in this creative process of co-ordination, and it is through their agency that immortality is achieved. (2) The philosophical form. The best exponent of this type is Richard Rothe, though Ritschl is also claimed as belonging to this school. Rothe starts from the assumption of a fundamental dualism, God and matter. 'God can create a spiritual being only indirectly, by creating a material creature which is specifically so organised that it is able to transubstantiate itself from materiality to spirituality, or, in other words, to spiritualise itself.' It is in the process of spiritualisation that immortality is won. (3) The literary or undogmatic type. In this case the belief is the logical conclusion of the presuppositions of the writer rather than a definite eschatological doctrine. We may take as examples of this type, Lotze, Matthew Arnold, and Father Tyrrell. (4) The theological form. This type is based upon theological rather than scientific or philosophical foundations. The first great modern exponent of it was Edward White, whose position may be summarised thus: 'Men were created with the gift of immortality, but lost it at the fall. Christ came to restore to humanity its lost inheritance. The object of the Incarnation was to immortalise mankind.' 'Those, therefore, who hear his voice and enter into fellowship with him through faith attain to immortality. Those, on the other hand, who reject him remain under the bondage of corruption, and in due time become as though they had never been.' It should be noted, however, that Edward White maintains that before their final annihilation all souls will be given another chance of repentance in the future life, and it will only be those who maintain their resistance to the end that will finally perish.

The theory of conditional immortality has some attractive features about it. It enables us to rid ourselves of the final dualism which the belief in everlasting punishment entails, and it avoids the feeling of easy-going optimism which Universalism almost always excites. Its radical defect, however, lies in the fact that it denies the immortality of the soul. If it assumes that none who have not experienced the life in Christ survive death, then it has to face all the difficulties which beset the orthodox theory—e.g. the punishment of those who cannot be held responsible for the absence of this faith in their lives. If, on the other hand, it admits some kind of future life for the wicked, and some kind of a second chance, it has to face the problem,

How is the soul finally destroyed? Is it by the act of the man who owns it, or is it by the act of God? Either alternative is hedged about by immense difficulties, from which it is not easy to find the way of escape.

The best modern discussion of the subject will be found in Leckie, *The World to Come and Final Destiny* (1918). See also Charles, *Eschatology* and *A Critical History of the Doctrine of a Future Life*; Mackintosh, *Immortality and the Future*; Salmond, *Christian Doctrine of Immortality* (1907); Alger, *History of the Doctrine of the Future Life*; McConnell, *Evolution of Immortality*; Edward White, *Life in Christ*; Ballou, *Ancient History of Universalism*; Farrar, *Eternal Hope*; H. Helladotherium, a fossil Giraffe (q.v.).

Hellas. See GREECE.

Hellebore, a name applied to two distinct genera of plants. The genus *Helleborus* is of the natural order Ranunculaceæ, and has a calyx of five persistent sepals; a corolla of eight or ten very short, tubular, honey-secreting petals; numerous stamens and three to ten pistils; a leathery capsule, and seeds arranged in two rows. The species are perennial herbaceous plants, mostly European, generally with a short root-stock; the stem mostly leafless, or nearly so, but sometimes very leafy. The favourite Black Hellebore—so called from the colour of its roots—or Christmas Rose (*H. niger*), produces its large white flowers in winter. The leaves are all radical; the stalks generally one-flowered; the flowers white or tinged with red. Black Hellebore formerly enjoyed a higher reputation as a medicinal agent than it now possesses. Melampus is represented as employing it in the treatment of madness centuries before the Christian era. The root is the part used in medicine, and it is imported into

Christmas Rose (*Helleborus niger*).

Britain from Hamburg, and sometimes from Marseilles. It consists of two parts—the rhizome or root-stock, and the fibres descending from it. The former is nearly half an inch thick, several inches long, and knotty, with transverse ridges and slight longitudinal striae. The taste is slight at first, then bitter and acrid. It is not much employed at the present day, but it has been found of service (1) in mania, melancholia, and epilepsy; (2) as an emmenagogue; (3) in dropsy

—its action as a drastic purgative, and its stimulating effect on the vessels of the liver, rendering it useful; (4) in chronic skin diseases; and (5) as an anthelmintic. Ten or fifteen grains of the powdered root act as a sharp purgative. The tincture, which is obtained by maceration in spirit, is usually given when its action as an emmenagogue is required. In an excessive dose it acts as a narcotic acrid poison, and causes vomiting, purging, burning pain in the stomach and intestines, faintness, paralysis, and death.—Stinking Hellebore (*H. fetidus*) grows on hills and mountains in the south and west of Europe, in some of the chalk districts of England, and in several places in Scotland. It has a very disagreeable smell, and green flowers somewhat tinged with purple. The stem is many-flowered and leafy.—Green Hellebore (*H. viridis*), also found in the chalk districts of England, has a leafy stem, with a few large greenish-yellow flowers. The celebrated hellebore of the ancients was probably a species peculiar to Greece and the Levant, *H. orientalis* or *H. officinalis*; all the species, however, have similar medicinal qualities. From the abundance of the plant around the city of Anticyra, hypochondriacal persons were said to need a visit to Anticyra.

White Hellebore (*Veratrum album*) belongs to the natural order Liliaceæ. The genus has polygamous flowers, with six-leaved perianth, six stamens, three pistils cohering at the base, a three-horned capsule separating into three many-seeded follicles, and compressed seeds winged at the apex. White hellebore has a leafy stem, sometimes 4 feet high, ovate-oblong leaves, a long terminal compound panicle, and yellowish-white flowers. It abounds in the mountains of the centre and south of Europe, but is not found in Britain. The root was once much used in medicine, but now rarely, although it seems to act powerfully in some diseases. It is a very acrid and active poison. Its powder is used to destroy lice, and by gardeners for killing caterpillars. A decoction and ointment of it are sometimes used in itch and ringworm. Caution is necessary even in handling the powder of white hellebore, and very unpleasant effects ensue from its getting into the eyes or nose.—American Hellebore, or Swamp Hellebore (*V. viride*), known also as Indian Poke or Itch Weed, is frequent in damp grounds from Canada to Carolina. Its root has properties similar to those of white hellebore. These properties seem to depend chiefly on an alkaloid called Veratria (q.v.).

Hellenist (Gr. *Hellenistēs*), one who adopts Greek customs and language. Hellenism commonly means that type of Greek culture that prevailed in many countries after the conquests of Alexander. By some the vernacular Greek of the Hellenists (as distinguished from true Greeks or Hellenes) is called Hellenistic, the word *koinē*, that is, 'common (dialect),' being confined to the cosmopolitan literary language of the time. Others include both under *koinē*. Attic Greek (much modified) became the standard of speech for the whole Greek world in the 5th and 4th centuries B.C., literary Attic, it is held, giving rise to the literary *koinē*, vernacular Attic to the vernacular *koinē*. It was among the Jews settled in Alexandria (q.v.) that the Hellenising tendency found its freest development.

A characteristic element of the Hellenistic Greek consists in its foreign, and especially its Hebrew and Aramaic words and idioms; but less emphasis is now laid upon its Hebraisms. Although it was in its origin a purely popular form of the language, yet its being employed in the Alexandrian or Septuagint version of the Old Testament has given to it all the fixedness and definite character of a

written language. The Hellenisms of the Septuagint differ in many respects from those of the New Testament, which again present some points of discrepancy with those of the Alexandrian Fathers; but there are certain leading characteristics common to them all. See BIBLE (*Language of the New Testament*).

The influence of the Hellenistic modes of thought on the Alexandrian philosophy will be traced under PHILO, NEOPLATONISM, PLOTINUS, &c.

Heller, STEPHEN, pianist and musical composer, was born on 15th May 1813 at Pesth, and made a brilliant début as a pianist when only nine years of age. Before he was sixteen he had played in most of the principal cities of Europe. From 1830, when he settled in Augsburg, he began to study composition. In 1838 he removed to Paris, where he occupied himself with composing and teaching until his death, on 13th January 1888. In the matter of technique he must be ranked beside Chopin. He wrote almost exclusively for the pianoforte; his works, which number about 150, consist of sonatas, études, &c., and are distinguished by originality and refinement. See his *Life* by Barbedette (Paris, 1876).

Hellespont. See DARDANELLES.

Hell Gate, or HURL GATE, named by the Dutch settlers of New York *Helle Gat*, is a pass in the East River, between New York city and Long Island, formerly very dangerous to vessels from its numerous rocks and rapid current. As early as 1851 attempts were made to blast away the obstructions; the operations which in 1885 finally freed the navigation are described, with an illustration, in the article BLASTING.

Hellin, a town of Spain, 69 miles by rail NNW. of Murcia. In the vicinity are productive sulphur-mines and sulphur-springs. Pop. 15,000.

Helm. See STEERING.

Helmet. See ARMOUR, HERALDRY.

Helmet-shell (*Cassidæ*), a genus of gasteropods, type of a family (*Cassidæ*), the members of which are somewhat whelk-like, and have thick, heavy shells, with bold ridges, a short spire and a long aperture, the outer lip toothed, the canal recurved. Numerous species, amounting to about fifty if we include closely allied genera such as *Cassidaria*, occur in the warmer seas. As the shells are made up of differently-coloured layers, they are much used for the manufacture of Cameos (q.v.). The species most used is the large Black Helmet (*C. madagascarensis*), sometimes almost a foot long, with a whitish outer and black inner layer.

Helmholtz, HERMANN VON, a very distinguished scientist, was born at Potsdam, 31st August 1821; he was ennobled by the Emperor of Germany in 1883. He was at first a surgeon in the army, then assistant in the Berlin Anatomical Museum, and was a professor of Physiology from 1849 at Königsberg, from 1855 at Bonn, and from 1858 at Heidelberg. In 1871 he became professor of Physics in Berlin. Helmholtz is equally distinguished in physiology, in mathematics, and in experimental and mathematical physics. His physiological works are principally connected with the eye, the ear, and the nervous system. Thus, we have his exhaustive treatise on Physiological Optics, his *Speculum* for the examination of the Retina, his Discourse on Human Vision, and various papers on the means of measuring small periods of time, and their application to find the rate of propagation of nerve-disturbances. Of a semi-physical nature we have his Analysis of the Spectrum, his explanation of

Vowel Sounds (*Klangfarbe der Vocalen*; see SOUND), and his papers on the Conservation of Energy with reference to Muscular Action. In physical science he is known by his paper on Conservation of Energy (*Ueber d. Erhaltung d. Kraft*, 1847, translated [badly] in Taylor's *Scientific Memoirs*, new series); by a popular lecture on the same subject (1854); by two memoirs in *Crelle's Journal*, on Vortex-motion in fluids, and on the Vibrations of Air in open pipes, &c., and by several researches into the development of electric current within a galvanic battery. His *Populäre wissenschaftliche Vorträge* appeared in 1865-76 (Eng. trans. by Atkinson, with Introduction by Tyndall, 1881); his great work on *Die Lehre der Tonempfindungen* (trans. by Ellis, *The Sensations of Tone*) in 1862; his *Wissenschaftliche Abhandlungen* in 1882-95; his *Reden und Vorträge* in 1884; and his *Vorlesungen über theoretische Physik* in 1897-1907. He died 8th September 1894.

See books by M'Kendrick (1899), and (in German) by Bezold (1895) and Königsberger (1903; trans. 1906).

Helminthology, that branch of Zoology which treats of worms, especially parasites.

Helmond, a town in the Netherlands, province of North Brabant, lies 23 miles NW. of Venlo by rail. There are manufactures of textiles and cigars. Pop. 20,000.

Helmont, JEAN BAPTISTE VAN, Belgian chemist, was born at Brussels in 1577. At Louvain he studied medicine and its cognate sciences, but soon turned aside from them to throw himself into the movement known as mysticism, to study the works and practise the precepts of Thomas à Kempis and Johann Tauler. Then, falling in with the writings of Paracelsus, he came back to his first love, and began to study chemistry and natural philosophy. After spending several years in France, Switzerland, and England, in 1605 he returned to Amsterdam, married Margaret van Ranst, a noble lady of Brabant, and in 1609 settled down at his estate near Vilvorde, where he spent the remainder of his life in chemical investigations of various kinds. He died 30th December 1644. In spite of much theosophical mistiness and much alchemical error, Van Helmont is regarded by some historians of chemistry as the greatest chemist who preceded Lavoisier. He was the first to point out the imperative necessity for employing the balance in chemistry, and by its means showed, in many instances, the indestructibility of matter in chemical changes. He paid much attention to the study of gases, and is supposed to have been the first to apply the term *gases* to elastic aeriform fluids. Of these gases he distinguished several kinds. He was also the first to take the melting-point of ice and the boiling-point of water as standards for the measurement of temperature. It is in his works that the term *saturation* is first employed, to signify the combination of an acid with a base; and he was one of the earliest investigators of the chemistry of the fluids of the human body. Along with other physiologists of his day, he speculated much on the seat of the soul, which he placed in the stomach. An account of his contributions to the knowledge of chemistry will be found in the *Histories of Chemistry* by Kopp and Höfer. His works, entitled *Ortus Medicinæ*, were published by his son four years after his death, and frequently since then. See Rommelaere, *Études sur Van Helmont* (1868); Redgrove, *J. B. van Helmont* (1922).

Helmstedt, a town of Germany, 24 miles by rail ESE. of Brunswick, was formerly famous for its Protestant university, founded by Julius, Duke of Brunswick, in 1574, and suppressed by Jerome Bonaparte in 1809. The university building (the

Juleum), which still remains, the 12th-century church of St Stephen, and the Marienberg church are the most noteworthy edifices. Helmstedt grew up originally round the monastery (now in ruins) of St Ludger in the 9th century. Pop. 16,500.

Helmund, or HELMAND, a river of Afghanistan, rises on the south slopes of the Hindu Kush, flows south-west, west, and north-west, and after a course of about 600 miles empties itself into the lake of Hamum. See map at AFGHANISTAN.

Helobiae, or MARSH LILIES, form one of the chief groups of Monocotyledons, and comprise Potamogetonaceæ, Butomaceæ, Alismaceæ, Juncaginæ, Hydrocharideæ, and other orders.

Heloderm. See GILA MONSTER.

Héloise. See ABELARD.

Helots were the lowest of the four classes into which the population of ancient Sparta was divided. They are generally supposed to have been the aboriginal population of the country, and to have been reduced to bondage by their Dorian conquerors, their numbers being swelled from time to time by the addition of peoples conquered in war. They belonged to the state, which alone had the power to set them at liberty; but they toiled for individual proprietors, and were bound to the soil—i.e. they could not be sold away from the place of their labour. They were the tillers of the land, for which they paid a rent to their masters; they served at the public meals, and were occupied on the public works. In war they fought as light troops, each freeborn Spartan (who bore heavy armour) being accompanied to battle by a number of them, sometimes as many as seven. On rare occasions they were equipped as heavy-armed soldiers. It is a matter of doubt whether after emancipation they could ever enjoy all the privileges of Spartan citizenship. They were treated with much severity by their masters, especially in the later ages of Sparta, and were subjected to degradation and indignities. They were whipped every year, to keep them in mind of their servile state; they were obliged to wear a distinctive dress (clothes of sheepskin and a cap of dog's-skin), and to intoxicate themselves as a warning to the Spartan youth; and when they multiplied to an alarming extent, they were often massacred with the most barbarous cruelty. On one occasion 2000 of them, who had behaved bravely in war, were encouraged to come forward for emancipation, and were then treacherously put to death. The Spartans organised, as often as necessity required, secret service companies (*Gr. krypteia*) of young men, who went about armed with daggers, and by night and day assassinated the Helots, selecting as their special victims the strongest and most vigorous of the race.

Helouan. See HELWÂN.

Helps, SIR ARTHUR (1813–75), essayist and historian, was born at Streatham, and, passing from Eton to Trinity College, Cambridge, was thirty-first wrangler in 1835. He became private secretary to the Chancellor of the Exchequer and next to the Irish Secretary. On the fall of the Melbourne ministry he retired to enjoy twenty years of lettered leisure. *Thoughts in the Cloister and the Crowd* (1835) was followed by *The Claims of Labour* (1844) and *Friends in Council* (1847–59), discussions on social questions. Then came *Realism* (1869) and *Talk about Animals and their Masters* (1873). Helps's strong interest in the slavery question prompted his *Conquerors of the New World and their Bondsmen* (1848–52) and *The Spanish Conquest in America* (1855–61). Other works are biographies of *Las Casas* (1868), *Columbus* (1869), *Pizarro* (1869), *Cortes* (1871); *Thoughts upon Government* (1872); and *Social Pressure* (1875). In 1860 he was appointed Clerk to the Privy-council; and he edited

Prince Albert's *Speeches and Addresses* (1862) and Queen Victoria's *Leaves from a Journal* (1868).

Helsingborg, an ancient seaport of southern Sweden, 32 miles NW. of Malmö, on the Sound, opposite Elsinore (Dan. *Helsingør*). It is connected by branch-lines with the railway from Stockholm to Malmö. There are a good harbour, some fishing, and considerable manufactures of copper and rubber, as well as large breweries. It figures several times in the wars between Sweden and Denmark. Pop. 48,000.

Helsingfors (Finnish, *Helsinki*), capital of the republic of Finland, beautifully situated on the Gulf of Finland on a peninsula, surrounded by islands and rocky cliffs, a clean town, built up in an absolutely modern way, with broad straight streets at right angles; several fine parks and public squares; fine public and private buildings. The centre of the town is the so-called Square of the Senate, surrounded by the House of the Ministry, the university, and the imposing Nicolai Church. The university was removed thither from Turku (Åbo) in 1828, where it had been founded in 1640. It possesses a great library, many hospitals, a botanic garden, a valuable observatory, and many laboratories. In Helsingfors there are also a technical high school, a commercial high school, numerous higher educational institutions and professional schools, an imposing national museum, art collections, libraries, an opera, theatres, &c. It is as regards production the greatest industrial town of Finland. The commerce is notable, the imports are greater than to any other town in Finland. The exports consist chiefly of timber and products of the paper industry, the imports of cereals, iron and iron goods, machinery, coals, colonial produce, &c. The harbour is very good, spacious, and well sheltered. Pop. (1815) 3543; (1860) 7018; (1889) 64,817; (1920) 197,848. Two-thirds of the inhabitants are Finnish, and one-third Swedish speaking.

On the islands south of Helsingfors are the forts of Suomenlinna or Sveåborg, which were constructed in 1748–66, and in their time were so strong and so well appointed as to gain them the title of 'the northern Gibraltar.' To-day the old fortress of the Swedish era is but an historical monument. Islands farther out to sea than Suomenlinna have been strongly fortified in modern times.

Helsingfors was founded in 1550 by Gustavus I. of Sweden. In August 1855, during the Crimean war, Sveåborg was bombarded for two days and nights by a section of the allied fleet without any material impression being made upon the forts.

Helsingör. See EL SINORE.

Helsinki. See HELSINGFORS.

Helst, BARTHOLOMÆUS VAN DER, a Dutch painter, was born (according to tradition) at Haarlem in 1613. He was joint-founder in 1654 of the painters' guild of St Luke at Amsterdam, where he lived, and where he died in 1670. He attained great celebrity as a portrait-painter. Some of his pictures seem to bear traces of Franz Hals's influence. One of his works at Amsterdam, a 'Mustering of the Burgher Guard,' with thirty full-length figures, was pronounced by Sir Joshua Reynolds to be 'the first picture of portraits in the world.' His later creations are inferior in merit to the pieces painted before 1650. Numerous paintings by him exist in European galleries.

Helston, an old market-town and municipal borough of Cornwall, 10 miles WSW. of Falmouth. It was made a borough by King John in 1201; and from the reign of Edward I. to 1832 it sent two members to parliament, and one till 1885. It has long been noted for its *Furry* or *Flora Dance*, held on the 8th May. Pop. 2600.

Helth, or **HELTAL**, **KASPAR**, a Transylvanian reformer and printer, born about 1520 at Heltau, near Klausenburg, of Saxon family, studied theology at Wittenberg, became pastor of Klausenburg, where he set up a printing-press in 1550, and printed among other books (in German and Hungarian) most of the Bible, Lutheran catechisms, and a Hungarian chronicle.

Helvella, a genus of fungi, of the class Ascomycetes (see FUNGI), having the *pileus* turned downwards, lobed and folded, and the surface of the *hymenium* even. Some of the *Helvellæ* are edible, and much used in Germany.

Helvellyn, one of the highest mountains of England, in the west of Cumberland, between Keswick and Ambleside, with a knife-edged ridge, Striding Edge, reaching towards Patterdale. It is 3118 feet high, is easy of ascent, and commands magnificent views.

Helvetia, a Swiss colony (founded 1856) in the Argentine Republic, in the Gran Chaco, 80 miles N. of Santa Fe.—For ancient Helvetia, see **HELVETII**, SWITZERLAND. For the Helvetic Confessions, see **CONFESSIONS OF FAITH**; and for the Helvetic Republic, see **SWITZERLAND**.

Helvetii, a Celtic people inhabiting, according to Cæsar, the region between the mountains of Jura on the west, the Rhone on the south, and the Rhine on the east and north, the region corresponding pretty closely with the western part of modern Switzerland. Their chief town was *Aventicum*, and they were divided into four *pagi* or cantons, of which the most important was the *pagus Tigurinus*. They are first mentioned in the war with the Cimbri, but the chief event in their history is their attempted irruption into and conquest of southern Gaul, in which they were repulsed by Cæsar with frightful slaughter, 58 B.C. Fortunately we have the story in the terse but vivid narrative of Cæsar. They collected three months' provisions, burned down their twelve towns and 400 villages, and made a general rendezvous by Lake Leman in the spring of the year. Cæsar hastened to Geneva, destroyed the bridge, raised two legions in Cisalpine Gaul, and when the Helvetians sent delegates to demand a passage, delayed them until he had built a wall along the Rhone, 16 feet high and about 19 Roman miles in length, flanked with redoubts. After vainly attempting to pass this barrier, the Helvetii took another route, but were followed and defeated with terrible slaughter at Bibracte (*Autun*), and the remnant obliged to return to their own country, where they became subject to the Romans, who overawed all disaffection by the fortresses which they built, *Novodunum*, *Vindonissa*, *Aventicum*. Of 368,000 who left their homes, including 92,000 fighting-men, only 110,000 are said to have returned. See **SWITZERLAND**.

Helvétius, **CLAUDE ADRIEN**, one of the French Encyclopædists, was of Swiss origin, and was born at Paris in 1715. He was trained for a financial career, and in 1738 was appointed to the lucrative office of farmer-general. But this post he quickly resigned for the situation of chamberlain to the queen's household. At this time he associated much with the French philosophers of the day, Diderot, D'Alembert, Holbach, and others. In 1751 he withdrew to a small estate at Voré (Le Perche), where he spent the most of his life in the education of his family, the improvement of his peasantry, and in literary labours. In 1753 appeared his celebrated work, *De l'Esprit*, in which, carrying out, as he thought, the work of Locke, he endeavoured to prove that sensation is the source of all intellectual activity, and that the grand lever of all human conduct is self-gratification. The book created an immense sensation. It was denounced

by the doctors of the Sorbonne, and condemned by the parliament of Paris to be publicly burned. Everybody read it, and it was translated into the principal European tongues. Helvétius died at Paris, 26th December 1771, leaving behind him a work, *De l'Homme, de ses Facultés, et de son Éducation* (2 vols. Lond. 1772). His collected works were published in 14 vols. at Paris in 1796, and again in 3 vols. in 1818. See Morley's *Diderot and the Encyclopædists* (1878).

Helvoetsluys, or **HELLEVOETSLOUIS**, a naval station of South Holland, on the Haring-Vliet, an arm of the Maas, 17 miles SW. of Rotterdam. It has an excellent harbour.

Helwan, a town and health-resort of Egypt, 10 miles S. from Cairo and 2 miles from the Nile. It has an observatory, warm sulphur springs and baths, and of late is much frequented by Europeans.

Hemans, **FELICIA DOROTHEA**, *née* **BROWNE**, was born, a merchant's daughter, in Liverpool, 25th September 1793, and from 1800 was brought up near Abergele. In 1808–12 she published three volumes of poems, and in 1812 married an Irishman, Captain Hemans, who went to Italy in 1818; they never met afterwards. Miss Hemans spent the rest of her life in North Wales, Lancashire, and Dublin, where she died, 16th May 1835. Her principal works are *The Siege of Valencia* (1823), *The Forest Sanctuary* (1827), *Records of Women* (1828), *Songs of the Affections* (1830), *Hymns for Childhood* (1834), and *Scenes and Hymns of Life* (1834). A volume of *Poetical Remains* was published after her death, and a complete edition of her works, with a memoir by her sister, in 1839. Some of her lyrics, *The Voice of Spring*, *The Better Land*, *The Graves of a Household*, *The Treasures of the Deep*, and *The Homes of England*, have been exceedingly popular. Mrs Hemans, without great originality or force, was too fluent, and wrote much and hastily.

Besides her sister's memoir, there are *Memorials* by H. F. Chorley (1836); *Recollections* by Mrs Lawrence (1836); *Poetical Remains*, with memoir by Delta (1836); and *Poetical Works*, with memoir by W. M. Rossetti (1873). See also Espinasse's *Lancashire Worthies* (1874).

Hematite. See **HÆMATITE**.

Hemel Hempstead, a municipal borough of Hertfordshire, 23 miles NW. of London, a centre of the straw-plaiting industry. It has also paper-mills, iron-foundries, tanneries, and breweries. Pop. 14,000.

Hemerobaptists, an ancient Jewish sect that practised daily baptism or abluition. The name was also applied to the Mandæans (q.v.).

Hemerocallis. See **DAY-LILY**.

Hemianopia, **Hemianopsia** (Gr. *hēmi*, 'one-half,' *an-*, 'not,' and *ōps*, 'the eye,' *opsis*, 'sight'), vision limited to one-half of an object—a peculiar and rare form of disease, generally due to disease within the brain.

Hemichorda, or **HEMICHORDATA**, a class of worm-like animals supposed to be related to primitive vertebrates. See **BALANOGLOSSUS**, **ENTEROPNEUSTA**.

Hemicrania. See **HEADACHE**.

Hemidesmus. See **SARSAPARILLA**.

Hemihedrism. See **CRYSTALLOGRAPHY**.

Hemileia, a genus of fungi of the Uredinæ. *H. vastatrix* causes leaf-disease of Coffee (q.v.).

Hemimorphite, a mineral consisting of silicate of zinc ($H_2Zn_2SiO_4$), long confused with Calamine (q.v.). It is markedly pyroelectric; that is, while it is being heated one end becomes positively, the other negatively, electrified, and while it is cooling the character of the charges is reversed. From this fact it has been called electric calamine.

Hemiplegia (Gr. *hēmi*, 'one-half,' and *plēsō*, 'I strike'), Paralysis (q.v.) limited to one side of the face and body, and usually depending upon disease of the brain. Opposed in signification to Paraplegia.

Hempode. See QUAIL.

Hemiptera (Gr., 'half-winged'), a large order of insects, to which the general term 'bugs' is often applied, or the more modern title Rhynchota, in allusion to the characteristic suctorial proboscis. The order includes (1) forms with similar wings (Homoptera)—e.g. coccus insects, aphides, Cicadas (q.v.); (2) others with dissimilar wings (Heteroptera)—e.g. water-bugs, water-scorpions; and (3) parasites or Lice (q.v.).

Hemlock (*Conium*), a genus of plants of the natural order Umbelliferae, having compound umbels of small white flowers, small general and partial involucre, the limb of the calyx merely rudimentary, and a compressed ovate fruit with five prominent wavy ridges and no *vittæ*. The best-known and only important species is the Common

Flowers and Root of Common Hemlock (*Conium maculatum*):
c, a flower; d, a seed.

or Spotted Hemlock (*C. maculatum*), which grows by waysides, on heaps of rubbish, and in other similar situations in Britain and on the continent of Europe, in some parts of Asia, and now also as a naturalised plant in North America and in Chili. It has a root somewhat resembling a small parsnip; a round, branched, hollow, bright-green stem, 2 to 7 feet high, generally spotted with dark purple; the leaves large, tripinnate, of a dark shining green colour; the leaflets lanceolate, pinnatifid. All parts of the plant are perfectly destitute of hairs, and it is the only British species of the order Umbelliferae which has the stem smooth and spotted with purple. Both the general and partial umbels have many rays. The general involucre consists of several small leaflets, the partial involucre of three small leaflets, all on one side. The whole plant has a nauseous smell, particularly if rubbed or bruised. The leaves and fruit have been employed in medicine, but are no longer official in the *British Pharmacopœia*. The former should be gathered just before the time or at the commencement of flowering, and after the removal of the larger stalks they should be quickly dried by a heat not exceeding 120° F. They should then be preserved in perfectly closed tin canisters. The fruit is gathered when fully developed, but still green, and should be carefully dried.

The most important ingredient in hemlock is the alkaloid conine, a volatile, colourless, oily, strongly alkaline substance, $C_8H_{17}N$, but it also

contains two other alkaloids—methylconine and conhydrine. The fruit contains about one-fifth per cent. of it, the other parts of the plant merely traces. It is obtained by distilling the seeds with water which contains a little potash in solution; the conine passes over with the water in the form of a yellowish oil, and is purified by redistillation. Conine has been prepared artificially by Schiff. Conhydrine, $C_8H_{17}NO$, is a solid alkaloid, and is much less poisonous than conine. Conine and methylconine are extremely poisonous, and cause death by their action on the nervous system. The action of conium depends of course on the combined effects of the active principles contained in the plant. The symptoms of conium poisoning are weakness and staggering gait, passing on to paralysis, and death occurs from failure of the muscles of respiration. Dilatation of the pupil, ptosis, and asphyxial convulsions are also seen.

In medicine, it is now very seldom given internally as a sedative to the nervous system in chorea, incontinence of urine, paralysis agitans, and other affections. It may be administered internally in the form of powder (of the leaves), succus, tincture, or extract, while externally it may be applied as a soothing application to ulcers, painful piles, &c., in the form of ointment or poultice or suppository.

In cases of poisoning by hemlock, the evacuation of the stomach is the first thing to be attended to. Among the ancient Greeks, poisoning by hemlock was a common mode of death for condemned criminals, and thus it was that Socrates died.—Water Hemlock, or Cowbane (*Cicuta virosa*), is also an umbelliferous plant, of a genus having much-vaulted umbels, a five-toothed calyx, and almost globose fruit, each carpel with five broad flattened ribs and evident single *vittæ*. Water hemlock grows in ditches, on the margins of ponds, and wet grounds in Europe and the north of Asia. It is more common in Scotland than in England. It has a large fleshy white root, covered externally with fibres; an erect much-branched stem, 2 to 5 feet high; tripinnate leaves, with linear-lanceolate regularly and sharply serrated leaflets; no general involucre, or only a single small leaflet, partial

Water Hemlock (*Cicuta virosa*).

involucre of many short narrow leaflets; and white flowers. It contains an active principle, *Cicutazine*, and an essential oil. It causes tetanic spasms, insensibility, vomiting, and diarrhoea. Fatal results have occurred from eating the root. Another species, *C. maculata*, is common in North America, growing in marshy places. It has a spotted stem, like that of true hemlock, the name

of which it very generally receives in North America. The leaves are triternate, the leaflets ternate. It is a very poisonous plant, and is the cause of many deaths.—The *Cicuta* of the Romans was the *Conium* of modern botanists (Gr. *koneion*), as water hemlock does not grow in Italy or Greece. The ornamental plant, the so-called Giant Hemlock, which in good rich soil reaches a height of 12 to 15 feet in three months, is not really a hemlock at all, but a giant Cow-parsnip (q.v.).

Hemlock Spruce. See FIR.

Hemorrhage. See BLEEDING.

Hemp (*Cannabis*), a genus of plants of the Moraceæ or Cannabinaceæ (q.v.), having the male and female flowers on different plants; the male flowers with five-partite calyx and five stamens; the female flowers with a spathe-like calyx of one leaf, rolled round the ovary and partially split along one side, and two threadlike stigmas. There is only one known species (*C. sativa*), varying considerably, however, from soil, climate, and cultivation. It is an annual plant, a native of the warmer parts of Asia, but has been cultivated in Europe from the earliest historic times, and is now naturalised in many parts of Europe and America. Like flax, it adapts itself wonderfully to diversities of climate, and is cultivated equally under the burning sun of the tropics and in the northern parts of Russia.

Common Hemp (*Cannabis sativa*), male plant.

It is, however, readily injured by frost, particularly when young; and in many countries where it is cultivated it succeeds only because the warmth of the summer, though of short duration, is sufficient for its whole life. Hemp varies very much in height, according to the soil and climate, being sometimes only 3 or 4 feet, and sometimes 15 or 20 feet, or even more. Notwithstanding the coarseness of its leaves, it is an elegant plant, and is sometimes sown on this account in shrubberies and large flower-borders. The stem is erect, more or less branched; the leaves are five to nine fingered. The flowers are yellowish-green, small, and numerous; the male flowers in axillary racemes on the upper parts of the plant; the female flowers in short axillary and rather crowded spikes. The female plants are higher and stronger than the male. The stem of hemp is hollow, or only filled with a soft pith. This pith is surrounded by a tender, brittle substance, consisting chiefly of cellular tissue, with some woody fibre, which is called the *reed*, *boon*, or *shove* of hemp. Over this is the thin

bark, composed chiefly of fibres extending in a parallel direction along the stalk, with an outer membrane or cuticle.

Hemp is cultivated for its fibre in almost all countries of Europe, and in many other temperate parts of the world, most extensively in Poland, and in the centre and south of European Russia, which are the chief hemp-exporting countries. French hemp is much esteemed in the market, as is also that of England and Ireland, of which, however, the quantity is comparatively inconsiderable. *Bolognese Hemp* and *Rhenish Hemp* are varieties remarkable for their height; and a fibre of very fine quality, 8 or 9 feet long, is known in commerce by the name of *Italian Garden Hemp*. In the United States most of the hemp is grown in Kentucky. In England the cultivation of hemp is almost confined to Lincolnshire, Holderness in Yorkshire, and a few other districts, of which the moist alluvial soil is particularly suited to it. In cultivating hemp it is very necessary to have the soil so rich, and to sow the seed at such a season, that the plants shall grow rapidly at first, as they thus form long fibres. A crop of short scrubby hemp is almost worthless. The finer kinds of hemp

Common Hemp, female plant.

are used for making cloth, the coarser for sail-cloth and ropes. Hemp sown thin produces a coarser fibre than hemp sown thick. Something also depends on the time of pulling, for the crop is pulled by the hand. When a rather fine fibre is wanted, and the seed is not regarded, the whole crop is pulled at once, soon after flowering; otherwise, it is usual to pull the male plants as soon as they have shed their pollen, and to leave the female plants to ripen their seed, in which case the fibre of the female plants is much coarser. The treatment of hemp by *retting*, &c. is similar to that of Flax (q.v.). The fibre of hemp is generally used for coarser purposes than that of flax, particularly for sailcloth, pack-sheet, ropes, and the caulking of ships.

The seed of hemp is produced in great abundance. It is commonly sold as food for cage-birds; and birds are so fond of it that not only the ripening fields, but the newly-sown fields, must be carefully guarded against their depredations. A fixed oil, *oil of hempseed*, is obtained from it by expression, which is at first greenish-yellow and afterwards yellow, and has an acrid odour, but a mild taste. This oil is used in Russia for burning in lamps, although the wick is apt to get clogged, also for making paints, varnish, and a kind of soft soap.

Hemp is cultivated in warm countries not so much for its fibre as for a resinous secretion, which has narcotic or intoxicating qualities (see *HASHISH*). Hemp is also used as a therapeutic agent under the name of Indian Hemp, or Bhang,

and may be administered in the form of resinous extract or of tincture; and it is usually prescribed (like opium) for its hypnotic, anodyne, and antispasmodic properties. Although less certain in its action than opium, it possesses these advantages over that drug—that it does not constipate the bowels, create nausea, or check the secretions, and that it is less likely to occasion headache.

The name Hemp (O.E. *henep*; Ger. *Hanf*; cognate with Greek *kannabis*, Latin *cannabis*, Sanskrit *çana*) is often extended with some distinctive prefix to many of the fibres used for ropes and coarse fabrics—Sunn Hemp, Manila Hemp, Deccan Hemp, Sisal Hemp, &c. See APOCYNACEÆ, BOWSTRING HEMP, FIBROUS SUBSTANCES.

Hemp Palm (*Trachycarpus excelsa*), a palm of China and Japan, the fibre of the leaves of which is much employed in those countries for making cordage. Hats are also made of its leaves, and even cloaks and other garments for wet weather.

Hems, HOMS, or HUMS (Lat. *Emesa*), a city of Syria, is situated near the right bank of the Orontes, 63 miles NE. of Tripoli. It is surrounded by ancient walls, now greatly ruined, and is entered by six gates. Its streets are narrow and dirty, and its houses mean. In ancient times it was chiefly celebrated for its temple of the Sun, now destroyed, though probably its site is occupied by the dilapidated castle or fortress, ruined by Ibrahim Pasha in 1831. One of the priests of this temple, Heliogabalus, was raised to the imperial throne of Rome in 218. Under the walls of Hems (Emesa) Zenobia was defeated by the Emperor Aurelian in 272. In 636 the city was taken by the Saracens, when its old Semitic name Hems was revived; and in 1098 it fell into the hands of the Crusaders. It has a considerable trade in oil, cotton, and sesame, and produces, besides these commodities, silk goods and gold wares. Pop. about 50,000.

Hemsterhuis, TIBERIUS, Dutch philologist, was born at Groningen, 1st February 1685. He became professor of Greek at Franeker in 1720, and of Greek history at Leyden in 1740, where he died 7th April 1766. One of the greatest Greek scholars of his time, Hemsterhuis may be said to have created a new school of Greek philology, to which belong his distinguished pupils Ruhnken and Valckenaer. His editions of the *Onomasticon* of Pollux (1706), of the *Select Dialogues* of Lucian (1708 and 1732), and of the *Plutus* of Aristophanes (1744, by Schafer 1811) are his principal literary works. A beautiful picture of his life is given in Ruhnken's *Elogium Hemsterhusii* (1768 and 1789), republished in Lindemann's *Vitæ duumvirosum T. Hemsterhusii et D. Ruhnkenii* (Leip. 1822). From Hemsterhuis's MSS. *Anecdota Hemsterhusiana* (1825) have been edited by Geel, and *Orationes et Epistolæ* (1839) by Friedemann.

Hen. See POULTRY.

Henbane (*Hyoscyamus*), a genus of plants of the natural order Solanaceæ, having a five-toothed calyx, an irregular, funnel-shaped corolla, and a capsule opening by a lid and enclosed in the hardened calyx. The species are mostly annual and biennial herbaceous plants, and natives of the countries near the Mediterranean Sea. The only species found in Britain is the Common Henbane (*H. niger*), which is not uncommon in waste places and in the neighbourhood of towns and villages, particularly in calcareous soils, and on the sandy shores of Scotland. It is an annual plant, somewhat bushy, about 2 feet high, with large sinuated or sharply-lobed leaves without leaf-stalks, and large dingy yellow flowers with purplish veins. The whole plant is covered with

unctuous hairs, and has a nauseous smell, which gives warning of its strong narcotic poisonous quality. Cases of poisoning by henbane are, however, not rare, but are more frequently owing to the proceedings of quacks than to any mistake of the plant for an esculent.

The seeds contain in largest quantity the peculiar alkaloid on which the properties of the plant chiefly depend, *Hyoscyamia* or *Hyoscyamin*, which crystallises in stellated acicular crystals of a silky lustre.

Henbane (*Hyoscyamus niger*).

The symptoms of poisoning by henbane are similar to those produced by other narcotic poisons, and the proper treatment is the same as in cases of poisoning by opium. In medicine henbane is employed both externally and internally. The leaves are the part commonly used; they are gathered and quickly dried when the plant is in full flower. Fomentations of henbane are applied to painful glandular swellings, parts affected with neuralgia, &c., and are often found to afford relief. An extract of henbane is sometimes employed instead of belladonna to dilate the pupil of the eye. Tincture and extract of henbane are often administered in cases of annoying cough, spasmodic asthma, and other diseases requiring sedatives and antispasmodics. Henbane is also employed to calm mental irritation and to induce sleep. For many cases it has one great advantage over laudanum, in not producing constipation. The smoke from the burning seeds of henbane is sometimes introduced into a carious tooth to relieve toothache. Henbane contains also another poisonous alkaloid, hyoscin. *Hyoscyamin*, *hyoscin*, and *atropine* are isomeric.

The other species of henbane possess similar properties. From the Egyptian *H. muticus* atropine is prepared. The dried stalks of *H. albus* are used by smoking in Greece to allay toothache.

Henderson, ALEXANDER, a famous Scottish ecclesiastic, born in 1583, and educated at St Andrews, where in 1610 he was placed in the chair of Rhetoric and Philosophy, being soon after presented by Archbishop Gladstones to the living of Leuchars, in Fife. Although the nominee of a prelate, he soon embraced the popular cause, and became one of its foremost leaders. He is supposed to have had a great share in drawing up the *National Covenant*; he withstood to the face the lukewarm theologians of Aberdeen, and was unanimously placed in the moderator's chair at the memorable General Assembly at Glasgow in November 1638, which in the face of the king's commissioner restored all its liberties to the Kirk of Scotland. In all the tortuous negotiations with

the king Henderson took a principal part, and had many interviews with him. He was moderator at Edinburgh in 1641, and again in August 1643, and drafted the famous *Solemn League and Covenant*, which was soon adopted also by the English parliament. Henderson was one of the Scottish commissioners that sat in the Assembly of Divines at Westminster, and in its work spent his last three years in England. He died at Edinburgh, 19th August 1646. See the Lives by Aiton (1836), M'Crie (1846), and Orr (1919), and Baillie's *Letters and Journals*.

Henderson, ARTHUR, statesman, was born in Glasgow, 15th September 1863, served an apprenticeship as a moulder at Newcastle, and subsequently became prominent in trade-union, municipal, and political affairs. In 1903, as a Labour member, he first entered parliament, and in 1908-10 and 1914-17 was chairman of the Labour party. During the Great War he stood at first for resolute prosecution of the conflict, supporting compulsory service and other measures, and was a member of both Coalition ministries, in the first as President of the Board of Education and Paymaster-General, being at the same time Labour adviser to the government, in the second as member of the war cabinet of four without portfolio; but in 1917, following an official visit to the first revolutionary government of Russia, he resigned, his advocacy of British participation in a proposed international conference on international relations to be held at Stockholm under the auspices of the International Socialist Bureau being almost everywhere rejected. Thereafter he made common cause with the pacifist wing of the Labour party, at the cost, for a time, of his seat in parliament. In 1920 he visited Ireland informally in the interests of peace, and in 1924 became Home Secretary in the first Labour government.

Hendon, an urban district in Middlesex, 8 miles N.W. of St Paul's, London. It is a residential suburb, but it is to the great aerodrome, the terminus of the continental air lines, that it owes its importance. Mill Hill, a Roman Catholic college, is within its boundaries. Pop. 56,000.

Hendricks, THOMAS ANDREWS, vice-president of the United States, was born in Ohio, 7th September 1819, and admitted to the Indiana bar in 1843. He served one term in the state legislature, sat in congress from 1851 to 1855, and in the United States senate from 1863 to 1869, and in 1872 was elected governor of Indiana. In 1876 he was the Democratic candidate for the vice-presidency, but was not returned (see HAYES, R. B.); in 1884 he was elected. He died 25th November 1885.

Henequen, or SISAL HEMP. See FIBROUS SUBSTANCES, SISAL HEMP.

Hengist (O.E. 'stallion') and **Horsa**, the names of the two brothers who led the first band of Teutonic invaders to Britain. They are mentioned by Nennius and the *Anglo-Saxon Chronicle*, so that we need not insist upon the suspicious etymologies of the names so far as to dismiss their story as a myth. According to the story they came about the year 449 to help King Vortigern against the Picts, and were rewarded for their services with a gift of the Isle of Thanet. Soon after they turned against Vortigern, but were defeated at Aylesford, where Horsa was slain. Ere long, however, Hengist is said to have conquered the whole of Kent.

Hengstenberg, ERNST WILHELM, a famous German champion of orthodox theology, was born 20th October 1802, at Fröndenberg, in Westphalia, where his father was clergyman. Prepared by his father for the university, he devoted himself at Bonn chiefly to Orientalia and philosophy, whilst at the

same time he took an enthusiastic part in the *Burschenschaften*. At first a sympathiser with rationalism, at Basel, whither he went in 1823, he passed over to the opposite extreme, and going next year as *privat-docent* to Berlin, soon put himself at the head of a rising orthodox party, whose principles he championed vigorously both in the university and through the press. In 1826 he was made extra-ordinary, in 1828 ordinary professor; and in 1829 doctor of theology. His *Evangelische Kirchenzeitung*, begun in 1827, combated rationalism even in its mildest forms, seeking to restore the orthodoxy and church discipline of the 16th and 17th centuries. All his works were devoted to the defence of the old interpretation and criticism of the Scriptures against the results of modern biblical science in Germany. Hengstenberg's great influence in ecclesiastical matters was employed in the carrying out of the high Lutheran dogmas of the church, of church-offices, and of the sacraments, by persecution of sectaries, by opposition to the union of Lutherans and Reformed, and by attempts to depose from their chairs Gesenius, Wegscheider, De Wette, and other so-called rationalistic teachers in the universities. He died at Berlin, May 28, 1869.

Henley, JOHN, commonly known as 'Orator Henley' (1692-1756), was the son of the vicar of Melton-Mowbray, in Leicestershire, and in 1726 set up in London what he called an 'oratory,' whence he professed to teach universal knowledge in week-day lectures and primitive Christianity in Sunday sermons. His addresses were a strange mixture of solemnity and buffoonery, of learning and ribaldry, of good sense and personalities, of wit and absurdity. Pope's 'preacher at once, and zany of the age' was nevertheless a man of considerable knowledge, and his poem *Esther* (1714) has some fine passages. After he left Cambridge he taught in the school of his native town; later, in London, he was a pensioner of Walpole, and edited a weekly paper. His *Oratory Transactions* contain a life of himself.

Henley, WILLIAM ERNEST (1849-1903), was born at Gloucester and educated at the Crypt Grammar-school there. While lying in hospital at Edinburgh he was visited by Robert Louis Stevenson, and for years the two were close intimates, collaborating especially in a series of plays, *Deacon Brodie*, *Beau Austin*, *Admiral Guinea*, and *Robert Macaire*. Henley edited *The Magazine of Art*, *The Scots* (later *National*) *Observer*, *The New Review*, and other serials; two or three anthologies of lyrics; an edition of Burns (with Mr T. E. Henderson) and one volume of an edition of Byron; part of a Shakespeare, and the 'Tudor Translations,' and republished in volumes *Views and Reviews* on literary and artistic subjects. With Mr Farmer, he worked on a great dictionary of slang. His poetry is vigorous and vivid in expression and rapid in movement; shows a fondness for unrhymed lyrical measures and experiments in unusual rhymes, for odd words and curious locutions; and is lacking chiefly in simplicity and grace. The 'Hospital Rhymes' in the first *Book of Verses* (1888; 4th ed. 1893) are full of the grimmest realism, whereas the 'Bric-à-brac' series are largely exertations in artificial verse forms. The *London Voluntaries*, published with the *Song of the Sword* (1892), had more of true poetry in them, of music and magic. A collected edition of his poems appeared in 1898; but *For England's Sake* (1900) and *Hawthorn and Lavender* (1901) were later volumes. All his work, prose and verse, reflects his virile temperament. His best poems were short; in much of his verse there were rough, even coarse, passages; yet some of his poems, and

parts of many, were exquisite. In criticism he was confident, aggressive, full of prejudices, anti-conventional in his judgments, arrogant and contemptuous, but stimulating, pungent, and trenchant in style; while his intolerance of dullness led to eccentricity and paradox. His *Works* were collected in 1908 *et seq.* See *Life* by Cornford (1913).

Henley-on-Thames, a municipal borough of Oxfordshire, at the base of the Chiltern Hills, and on the left bank of the Thames, 8 miles N.E. of Reading, 36 W. of London, and 24 S.E. of Oxford by road (by river 47). The five-arch bridge was built in 1786; the parish church, Decorated in style, was restored in 1864; and the grammar-school was founded in 1605. There is a 14th-century Chantry House. Malting is a principal branch of industry; there are also breweries, and a considerable trade in corn, flour, and timber. The principal amateur regatta of England has been held here every summer since 1839 (except in 1915-19). Pop. (1921) 6841. See ROWING; Burn, *A History of Henley-on-Thames* (1861), and Cook, *Henley Races and Rowing at Henley* (1919).

Henna, a small shrub, called by botanists *Lawsonia alba* (also *L. inermis* or *spinosa*, the younger bushes being spineless). It is also known as 'Egyptian privet' or 'Jamaica mignonette.' Henna grows in moist situations throughout the north of Africa, Arabia, Persia, and the East Indies. It is cultivated in many places for the sake of its flowers, which are much prized for their fragrance, particularly by the Egyptian ladies; but still more for the sake of the leaves, which abound in colouring matter, and which, being dried, powdered, and made into a paste with hot water and catechu, are very generally employed by women throughout the East to stain the nails and tips of the fingers and parts of their feet of an orange colour; also by men to dye their beards, the orange colour being converted into a deep black by indigo; and for dyeing of the manes and hoofs of horses, and to dye skins and leather reddish-yellow. Powdered henna-leaves form a large article of export from Egypt to Persia, and to various parts of Turkey, from which they find their way to more northern countries, and even to Germany, to be employed in dyeing furs and some kinds of leather. The use of henna for staining the nails appears—from allusions in ancient poets, and from some of the Egyptian mummies—to have prevailed from very ancient times. It is perhaps the camphire of the Bible. The use of henna for hands and feet is said to check perspiration, and gives a feeling of coolness. The process has to be repeated every two or three weeks.

Hennegau. See HAINAULT.

Henningsen, CHARLES FREDERICK, an English soldier of fortune and author, was born in 1815, served with the Carlists in Spain, where he rose to the command of the cavalry, with the Russians in Circassia, with Kossuth in Hungary, and with Walker in Nicaragua. In the American civil war he commanded a brigade on the Confederate side; and he afterwards was employed to superintend the manufacture of Minié rifles. He died at Washington, 14th June 1877. His books are for the most part records of travel and personal adventure, but include also *The Past and Future of Hungary* (1852), and *The White Slave*, a novel.

Henotikon (Gr. *henōtikos*, 'serving to unite'), an edict for uniting the Eutychians with the church, issued by the Emperor Zeno in 482 A.D.

Henrietta, DUCHESS OF ORLEANS, Charles I.'s youngest child, was born 16th June 1644. Her mother, Henrietta Maria, had to leave her behind

at Exeter, which in April 1646 was taken by Fairfax; but three months afterwards, disguised as a French beggar-woman, her governess, Lady Dalkeith, escaped with her from Oatlands to Calais. Her mother brought her up a Catholic. Gay, brilliant, beautiful, in 1661 she was married to Louis XIV.'s only brother, Philip, Duke of Orleans; 'of all the love he had borne her there soon remained nothing but jealousy.' As Louis's ambassador, in 1670 she wheedled Charles II. into signing the secret treaty of Dover; and she had been back in France little more than a fortnight, when on 30th June she died at St Cloud—almost certainly of poison, but possibly without her husband's cognisance.

See CHARLES II. and works there cited; Mme. de la Fayette's *Histoire d'Henriette d'Angleterre* (1720; new ed. by An. France, 1832); Mrs Everett Green's *Princesses of England*; and monographs by Baillon (French, 1885), Julia Cartwright (Mrs Ady; 1893), Arvéde Barine (1909).

Henrietta Maria, born at the Louvre, 25th November 1609, was the youngest child of Henry IV. of France, whose assassination six months afterwards left the babe to the unwise upbringing of her mother, Marie de Medicis. A lovely little thing, bright of eye and wit, but spoilt and wayward, she was married in 1625 to Charles I., and speedily evinced her bigotry, if not by a barefoot pilgrimage to Tyburn, yet by refusing to share in her husband's coronation. The dismissal, however, of her French attendants, and the murder of Buckingham, removed two conflicting causes of jealousy; and for ten years Henrietta might call herself 'the happiest woman in the world—happy as wife, mother, and queen.' But she had also made herself the best-hated woman in England. Strafford fallen (she did her worst to save him), and herself menaced with impeachment, on 23d February 1642, the eve of the Great Rebellion, she parted from Charles at Dover, and, repaire to Holland, there raised £2,000,000. A year later, after a great storm, during which she bade her ladies 'Take comfort: queens of England are never drowned,' she landed at Bridlington (q.v.), and, marching through England, again met King Charles near Edgehill. She sojourned with him at Oxford, until on 3d April 1644 they separated at Abingdon, never to meet on earth. At Exeter, on 16th June, she gave birth to a daughter, and in less than a fortnight had to flee before Essex to Pendennis Castle, whence she took shipping for France. A cruiser gave chase, and she charged the captain to blow up the magazine sooner than let her be captured; but at length she landed on the coast of Brittany. A liberal allowance was assigned her, but she pinched herself to send remittances to England; and the war of the Fronde (1648) had reduced her for a time to destitution, when, nine days after the event, news reached her of her husband's execution. That even this crowning sorrow failed to teach wisdom is shown by her quarrels with her wisest counsellors, and her efforts to convert her children. The story, however, of her secret marriage to her confidant, Henry Lord Jermyn (afterwards Earl of St Albans), rests solely on gossip. After the Restoration, 'la Reine Malheureuse,' as she called herself, paid two visits to England—one of four months in 1660-61, the other of three years in 1662-65. Pepys describes her as 'a very little, plain old woman.' She died of an overdose of an opiate on 31st August 1669, at her château of Colombes, near Paris, and was buried (Bossuet preaching) in the abbey of St Denis, whence her coffin was ousted at the Revolution.

See *Lives* by Miss Taylor (1905) and Miss Haynes (1912); Miss Strickland's *Queens of England*; CHARLES I. and works there cited.

Henry I., king of England, the youngest and only English-born son of William the Conqueror, was born in 1068, according to tradition at Selby, in Yorkshire. His father left him £5000, with a part of which he bought the districts of the Cotentin and the Avranchin from his brother, Robert of Normandy; and, when war broke out between William Rufus and Robert, Henry, although he had been imprisoned by the latter, helped him to defend Normandy, and saved his capital city, Rouen, for him. Yet in the treaty which followed (1091) he was excluded from the succession, and his brothers joined to deprive him of his lands. Immediately after the death of Rufus he rode to Winchester, seized the royal treasure, and in the absence of Robert, who was then on his way home from crusading in Palestine, was elected king by such of the Witan as were at hand, and crowned at Westminster four days after. He at once issued a charter restoring the laws of Edward and the Conqueror, recalled Anselm, and set about the stern reforms which gained him among his people the name of the Lion of Justice. He also strengthened his position by a marriage with Eadgyth (her name was changed to Matilda), daughter of Malcolm of Scotland and the good Queen Margaret, who was descended from the old English royal house. The highest honours under Henry, both in church and state, were strictly withheld from men of English blood; yet it was on the native English support that the king relied; and in 1101, when the nobles conspired to bring in Robert, who had now returned home, the English stuck faithfully by the king born in their own land, and the Normans were powerless. Without a battle Robert was induced to resign his claims, and Henry then established his power so securely that there was peace in England to the end of his reign. On the Scottish border also there was peace, and only twice (1114 and 1121) did Henry feel compelled to make expeditions into Wales. His controversy with Anselm (q.v.) regarding investiture, too, was conducted without bitterness on either side, and resulted in a compromise; while a later dispute with the papal see was ended in 1119 by Calixtus solemnly confirming the ancient customs of England.

Robert had received a pension of 3000 marks, but in 1105-6 Henry made war upon his badly-governed duchy; Robert was defeated in a bloody battle beneath the walls of Tinchebrai, on September 28, 1106, and was kept a prisoner during the remaining twenty-eight years of his life. The acquisition of Normandy, the ancient patrimony of his family, had been a point of ambition with Henry; to hold it he was obliged to spend long periods away from his kingdom, and to wage a nearly constant warfare, supported largely by English arms and by subsidies wrung from his English subjects. The French king, Louis the Fat, and the Counts of Anjou and Flanders took part with William, Robert's youthful son; but the first war ended in the peace of Gisors (1113), on terms favourable to Henry; and in the following year his daughter Matilda was married to the Emperor Henry V. of Germany, and a new alliance thus formed. The second war (1116-20) was marked by the defeat of the French king at Noyon in 1119; and in the same year he presented a formal complaint to Calixtus II. at the Council of Rheims. Henry, however, was able in a personal interview to satisfy the pope, who succeeded in bringing about a peace. In 1119, also, Henry's only son, William, was married to the daughter of the Count of Anjou; but in 1120 he was drowned by the sinking of the White Ship on his way from Normandy to England, and Henry's successes in arms and intrigue were

darkened for life. A fresh rebellion in Normandy ended in the battle of Bourgtheroulde (1124), and in cruel punishments inflicted on the principal prisoners taken. In 1126 Matilda, now a widow, came back from Germany; in the same year Henry induced the Witan to swear to receive her as Lady of England and Normandy if he should die without heirs-male; and before the year was out she was married to Geoffrey Plantagenet, the son of the Count of Anjou. In 1127 Robert's son William was put in possession of the vacant countship of Flanders; but in 1128 he died, and the wars between Henry and Louis ceased. Henry himself died on December 1, 1135, and the crown was seized by his sister Adela's son, Stephen of Blois.

Henry I. was styled *Beauclerc*, or the Scholar, in honour of his learning, which, for a king in his age, was not undeserving of distinction. Able he was, but crafty, passionless in his policy, and often guilty of acts of cold-blooded cruelty; yet he was at least consistent in his severity, unmoved by impulses such as, generally evil but sometimes good, had governed Rufus; and even his licentiousness was judged lightly after the foul vices of the Red King. Law was administered during his reign with strictness, and generally with fairness; the innocent might now and then be confounded with the guilty, and the penalties were often severe and barbarous enough, but, at the worst, only individuals suffered from his cruelty, while the great mass of his subjects reaped the blessings of his firm rule. Moreover, under the equal weight of his heavy hand, Normans and English were slowly compressed into one nation; and after the landing of Robert at Portsmouth in 1101, never again did the two races meet in arms face to face on English soil. 'Good man he was,' writes the chronicler, 'and mickle awe was of him. Durst none man misdo with other on his time. Peace he made for man and deer.'

See Freeman's *Norman Conquest*, vol. v. (1876); also Stubbs, *Constitutional History of England*, vol. i. (1874); and Dean Church's *Saint Anselm* (1870).

Henry II. of England, the first of the Angevin kings, was the son of Matilda, daughter of Henry I., and her second husband, Geoffrey Plantagenet, and was born at Le Mans, 25th March 1133. His mother, assisted by her illegitimate brother the Earl of Gloucester, had carried on a bitter war against Stephen, as a usurper, from 1139 to 1148. Henry himself, unable after his uncle's death to secure any powerful following, joined his father in Normandy. At eighteen he was invested with this duchy, his mother's heritage, and within a year after became also, by his father's death, Count of Anjou; while in 1152 his marriage with Eleanor of Aquitaine, the divorced wife of Louis VII., added Poitou and Guienne to his dominions, which now embraced nearly the whole of western France. In January 1153 he landed in England; and, after his and Stephen's armies had twice been face to face, a treaty was finally agreed to in November, whereby Henry was declared the successor of Stephen, whose son Eustace had died during the negotiations. Stephen died the next year; Henry was crowned on 19th December 1154, and issued a charter confirming his grandfather's laws. He at once re-established the machinery of the exchequer, banished the foreign mercenaries, demolished the hundreds of castles erected in Stephen's reign, and recovered the royal estates. The whole of the year 1156 the king spent in France, where he was employed until July in effecting the submission of his brother, Geoffrey of Nantes. Geoffrey died in 1158, and Henry, having secured his territories, spent five years warring and organising his possessions on the Continent, whence he returned in January 1163

to enter on the disastrous quarrel with the church that fills the second period of his reign.

Henry, like his grandfather, had come to the crown after an evil time of misgovernment and of anarchy, and his fame too is that of a lawgiver, the restorer of peace and order. His object was that of all the Norman kings—to build up the royal power at the expense of the feudal barons and of the church; but his policy, while selfish in its aim, was beneficent in result, inasmuch as he was wise enough to recognise that his power could be securely founded only on the well-being of the people. From the barons themselves his reforms met at the time with little serious opposition; with the clergy he was less successful. Not only could they use their weapon of excommunication with terrible effect, but, being tried by their own courts, they were not amenable to the common laws of the realm, and were protected from the punishment due to their crimes; so that thieves and murderers, calling themselves clerks, would for a first offence escape with penances and deprivation of orders. To aid him in reducing the church to subjection to the civil power he appointed his trusted chancellor, Becket, to the see of Canterbury. This was the great mistake of his life, for with his archbishop's pall Becket put on the spirit of the high ecclesiastic, and abandoned the king's service for the pope's. Henry compelled him and the other prelates to agree to the 'Constitutions of Clarendon' (q.v.); but Becket proved a sturdy churchman, and the long and obstinate struggle between him and his monarch was only terminated by his murder (see BECKET). Henry was barely saved from excommunication by his messengers making for him an unreserved submission to the pope; but he was determined not to repeat their oath. At a later date (1174) he did penance at Becket's grave, allowing himself to be scourged by monks; but, though the 'Constitutions of Clarendon' were formally repealed, the king was ultimately successful in reducing the church to subordination in civil matters. Before Becket's death Henry had made three military expeditions into Wales, none of them, however, of any permanent effect; and, while negotiations were pending for his absolution, he organised an expedition to Ireland. In 1155 Pope Adrian IV., an Englishman, had, in the so-called bull *Laudabiliter*, a document in dispute as to its authenticity, given approval to a proposal of Henry's to enter Ireland for the sake of extending the bounds of the church, his approval being based on the right of St Peter over all Christian islands; and in 1167 a number of Norman-Welsh knights, having been called in to the aid of a banished king of Leinster, had gained a footing in the country. Others soon followed, among them, in 1170, Richard de Clare, afterwards nicknamed Strongbow (q.v.), who in 1171 assumed rule as the virtual king of Leinster. Henry was jealous of the rise of a powerful feudal baronage in Ireland, and during his stay there, from the autumn of 1171 to Easter 1172, he secured the submission of kings and bishops, and left the power of Strongbow and the other nobles broken. For thirteen years his governors carried out his system of interference and persecution; and when in 1185 Prince John was appointed king of Ireland, he took with him a batch of Norman and French knights, who pushed the soldiers of the first conquest aside. But before the end of 1186 John himself was driven from the country, and all was left in confusion.

The third period of Henry's reign is occupied with the rebellion of his sons. The eldest had died in childhood; the second, Henry, born in 1155, was crowned as his father's associate and successor in the kingdom in 1170, having been married at

the age of five to the little princess Margaret of France. In 1173, incited by their jealous mother, Queen Eleanor, the prince and his brother Richard rebelled against their father, and their cause was espoused by the kings of France and Scotland. The latter, William the Lion, was ravaging the north of England with an army when he was surprised at Alnwick and taken prisoner, 12th July 1174. To obtain his liberty he submitted to do homage to Henry for Scotland (see SCOTLAND; also EDWARD I.). By September 1174 Henry had defeated the great league thus formed against him, and re-established his authority in all his dominions. In 1183, in the course of a second rebellion, Prince Henry died of a fever at Martel in France; and in 1185 Geoffrey, the next son, was killed in a tournament at Paris. At the end of 1188, while Henry was engaged in a war with Philip of France, Richard joined the French king; and in July, Henry, having lost the chief castles of Maine and the town of Le Mans, ill and broken in spirit, agreed to a treaty of peace, of which one of the stipulations was for an indemnity for all the followers of Richard. The sight of the name of his favourite son John in the list broke his heart; and he died at Chinon on 6th July 1189.

Upon the whole, Henry was an able and enlightened sovereign, a clear-headed, unprincipled politician, an able general. He did not use his power despotically; and such enemies as he could either win over or disable he spared. His reign was one of great legal reforms. With the *exchequer* the ancient office of the sheriffs was restored, the jury system was extended, circuit courts were established, and a high court of justice formed; whilst the institution of *Scutage* (q.v.) and the revival of the old Anglo-Saxon militia system did much to break the power of the great feudal lords. The earliest writer on English law, Ranulf de Glanvill (q.v.), was Henry's chief justiciary from 1180. He was ambitious for his children, but he used them so freely as counters in the great game of politics that he ultimately alienated whatever affection they had to give; yet, even so, he was sinned against deeply by both his wife and his sons. When not restrained by policy his temper was passionate and outrageous; and his personal vices were, though in much lesser degree, those of the first Henry. Fair Rosamond (see CLIFFORD) is commonly said to have had two sons by him, William Longsword, Earl of Salisbury, and Geoffrey, who became Archbishop of York, and who was faithful to him when his four legitimate sons took up arms against him. But there is no positive evidence that the former was her son; while Geoffrey's mother appears to have been a woman of degraded character, named Ykenai or Hikenai.

See Freeman; Stubbs, *Constitutional History* and preface to vol. ii. of the *Chronicle of Benedict of Peterborough* (1867); Mrs Green, *Henry the Second* (1888); Sir J. H. Ramsay, *The Angevin Empire* (1903); Salzman, *Henry II.* (1919).

Henry III. of England, grandson of Henry II., and eldest son of King John, was born at Winchester, 1st October 1207, and succeeded on his father's death at the age of nine. His reign is one of the longest and most troubled in English history, and he himself one of its least attractive and least interesting figures. The first forty-two years are for the most part a dreary record of misgovernment and purposeless extravagance, the next seven a period of strife and civil war, the remainder of little interest. Henry was more devout than his predecessors, and could boast more domestic virtues; but he inherited his father's faithlessness, and through all his impolicy exhibited a stubborn determination to be at least as autocratic as he.

The interest of the reign, however, centres not in the king, but in the birth and infancy of the English constitution. In 1227 Henry declared himself of age to govern; in 1232 he deprived Hubert de Burgh, who had ruled England well as regent, and as justiciary had practically continued to govern the country, of all his offices; and in 1234 he was compelled to dismiss Hubert's rival and successor, Peter des Roches. He took the administration into his own hands, and henceforward managed everything ill both at home and abroad. A war with France cost him Poitou, and might have cost him all his continental possessions, and even his own liberty, but for the generous disposition of the French king, Louis IX. In his boyhood, under the direction of the judicious Earl of Pembroke, he re-issued the Great Charter, though with certain important omissions; and he confirmed it more than once afterwards, but always as a condition of a money grant. He was beset with favourites, chiefly from the country of his queen, Eleanor of Provence, and he allowed exorbitant exactions on the part of the pope. His misrule and extortion roused all classes, and in 1258 the parliament, as the assembly of the barons and bishops was already called, headed by his brother-in-law, Simon de Montfort, Earl of Leicester, forced him to agree to the Provisions of Oxford (q.v.), whereby he transferred his power temporarily to a commission of barons. But jealousy and disunion among the barons soon enabled Henry to repudiate his oath, and after a brief period of open war (1263) the whole matter was referred to the arbitration of Louis of France, who annulled the Provisions. De Montfort and his party disregarded their agreement to be bound by his judgment, and took up arms against the king. They defeated him, and took him prisoner in the battle of Lewes, on 14th May 1264. The battle was followed by an agreement called the Mise of Lewes, more humiliating to the king than the Provisions of Oxford. Earl Simon now summoned the parliament (20th January 1265) which has since been famous as the first assembly of the sort in which boroughs were represented; although it was nearly the end of the century before the representatives of towns began regularly to sit in parliament. De Montfort's supremacy did not last long. Within a year the powerful Earl of Gloucester deserted his party, and, with Prince Edward, who had escaped from captivity, led an overwhelming army against him. Simon was defeated and slain at Evesham, on 4th August 1265. With this event the importance of this long, dismal reign ends. Henry died on 16th November 1272, and his son Edward, though absent in Palestine, was at once proclaimed king.

See Freeman; Stubbs (vol. ii.); Ramsay, *Dawn of the Constitution* (1908); Miss Norgate, *Minority of Henry III.* (1912); Margaret A. Hennings, *England under Henry III.* (1924); Prothero's *Montfort* (1887), and works cited at MONTFORT.

Henry IV. of England, the first king of the House of Lancaster, was born 3d April 1367, the son of John of Gaunt, and was surnamed Bolingbroke, from his birthplace in Lincolnshire. His father was the fourth son of Edward III., his mother the daughter and heiress of Duke Henry of Lancaster. In 1381 Henry married Mary de Bohun, the second richest heiress in England, and in 1386 was made Earl of Derby. For some years he led a roving life. He was present at the taking of Tunis in 1390, fought against the heathen on the shores of the Baltic, made an attempt to reach Jerusalem in 1392-93, and commanded some English lances in the disastrous battle against the Turks at Nicopolis (1396). In 1397 he supported Richard II. in the revolution which destroyed the

Duke of Gloucester, and was created Duke of Hereford; in 1398 he was banished, and in the following year, when his father died, his estates were declared forfeit to Richard. Thereupon, in July 1399, Henry landed in Yorkshire with three small vessels. He met with no opposition; and on 29th September, in the Tower, he induced Richard, who had been deserted and betrayed, to sign a renunciation of his claims to be king. On the next day Henry rose in his place in parliament and claimed the kingdom and crown, all present assenting. Henry's claim to succeed by right of birth was barred by the six-year-old son of the Earl of March, who was descended from an older branch. Richard was shut up in the castle of Pomfret. There was an attempted rising on the part of his friends in the following January, but it was easily suppressed, the leaders being beheaded by the mob; and in the middle of February 1400 Richard died in his dungeon, perhaps from starvation. Yet his death was more than once denied by the disaffected party, and many cruel executions were necessary before the report that he had escaped to Scotland could be silenced. Henry's reign was one of trouble and commotion. There were incessant rebellions, and more than one treacherous attempt was made upon his life, until in his last years he was reduced to a state of constant fear. Lawlessness, rising partly out of the great poverty and heavy taxation, was rife in every quarter; piracy crippled commerce, though not much more so than the increased duties laid on staples; and frequent descents were made upon the coast by expeditions from France—for the country of Richard's young queen was Henry's implacable enemy. The king's movements, too, were constantly hampered for want of money, there being no funds available for anything beyond the most ordinary expenses of the country; and 'war treasurers' were ultimately appointed by the impatient Commons to watch the disbursement of the sums voted. In 1404 the Illiterate Parliament, to which it had been directed that no lawyer should be returned as a knight of the shire, proposed to confiscate the property of the clergy; but the necessity under which Henry found himself of supporting the authority of the church led him not only to discountenance all such proposals, but also to permit severe enactments against heretics. On 2d March 1401 the first case in England of burning for heresy occurred, when a clergyman named William Chatrys was burned at Smithfield.

The chief disturbances of the peace of the reign, however, were occasioned by the Welsh and the Scots. Under Owen Glendower (q.v.) the Welsh maintained their independence throughout this reign, and kept up a harassing warfare against the English. Scotland Henry invaded in 1400, besieging Edinburgh Castle until compelled by famine to retire. In 1402, while Henry was engaged against the Welsh, the Scots in turn made an irruption into Northumberland with 40,000 men; but a body of some 10,000 of them were encountered by the Earl of Northumberland and his son Harry Percy, with a force computed at 12,000 lances and 7000 archers, and met with a crushing defeat (14th September) at Humbleton (or Homildon), where Earl Douglas and the Duke of Albany's son were taken prisoners. Harry Percy (Hotspur) and his house shortly after broke with the king, and leagued with Douglas and Glendower against him; but the king met the Percies at Shrewsbury (21st July 1403), where the insurgents were utterly defeated, Hotspur slain, and Douglas again taken prisoner. Two other insurrections followed, but were easily suppressed; and the remainder of the reign was comparatively free from domestic troubles. In 1406 Prince James of Scotland

(afterwards James I.) was captured on his way to France, and was detained and educated in England. The civil wars in France gave Henry an opportunity to send two expeditions (1411 and 1412) to that country; but in his later years he was a miserable invalid, afflicted with epileptic fits, the last of which seized him while in Westminster Abbey. He died on 20th March 1413, in the Jerusalem Chamber; and this was taken to explain a prophecy which had said that he was to die at Jerusalem—and as late as the preceding November he certainly had hoped to go once more on crusade. Henry's last days were embittered by a dread that he would be supplanted by his eldest son. He had commenced his reign energetic and determined to govern on constitutional principles; to this resolve he remained steadfast, as he maintained also his devoutness and purity of life; but disappointment and perhaps disease latterly made him cruel, vindictive, suspicious, and irresolute. The labour and sorrow of founding a dynasty were his, and his usurped crown he found a heavy burden.

See Stubbs, vol. iii.; Gairdner, *The Houses of Lancaster and York* (1874); Wylie, *History of England under Henry the Fourth* (1884-98); Sir J. H. Ramsay, *Lancaster and York* (1892). To these must be added, for this and the next two reigns, and for Henry VIII., Shakespeare's historical plays, which are based mainly on the Chronicles of Hall and Holinshed (q.v.). For their value as history, see Courtenay's *Commentaries on the Historical Plays of Shakespeare* (2 vols. 1840).

Henry V. was born in the castle of Monmouth, 9th August 1387, the eldest of the six children of Henry IV. by Mary de Bohun, from whom he inherited a certain taste for books. According to a local tradition, he studied for a time at Queen's College, Oxford, perhaps in 1399-1400. From 1401 we find him engaged against Glendower, and in 1403—the year of Shrewsbury, where he was wounded in the forehead by an arrow—he was appointed the king's lieutenant in Wales. Here he remained in command of operations until 1408, and succeeded at least in keeping Glendower behind the barriers of his mountains. In 1409 he became Constable of Dover, and in 1410 captain of the town of Calais; and in one of these places, or in London, he resided until his father's death. The story of his committal to prison is now considered to be referable, if at all, to an incident in the life of Edward II. when Prince of Wales (see GASCOIGNE). There is some evidence that Henry was for a time not on good terms with his father; but the charges of riot and profligacy are at least gross exaggerations of a young soldier's harmless, boisterous frolics. He was crowned on 9th April 1413, and at the outset of his reign liberated the young Earl of March, who was the true heir to the crown, restored the son of Hotspur to the lands and honours which his father had lost by rebellion, and had Richard II.'s body brought up from Langley and buried in Westminster. The great effort of his reign was an attempted conquest of France, now ruled by an imbecile king and distracted by internal factions; and in 1414 Henry formally demanded the French crown, to which he seems to have believed sincerely that he had a valid claim, through his great-grandfather, Edward III. On 11th August 1415 he sailed with an army of 30,000 men, after crushing a conspiracy to carry off the Earl of March; and on 22d September he took Harfleur, after five weeks' siege, at a great cost of life, including 2000 men carried off by dysentery. On 8th October he set out on a march to Calais, and at Agincourt (q.v.), on the 25th, where his way was blocked by a French army, gained a battle against such enormous odds as to make his victory one of the

most notable in history. Two years after he again invaded France, and by the end of 1418 Normandy was once more subject to the English crown. Henry's forces had appeared before the walls of Paris, when the murder of the Duke of Burgundy (10th September 1419) aroused the indignation of France against the dauphin, who had to withdraw beyond the Loire; and on 21st May 1420 was concluded the 'perpetual peace' of Troyes, under which Henry was recognised as regent and 'heir of France,' and received the French king's youngest daughter, Catharine, in marriage. In February 1421 he took his young queen to England to be crowned, having shown the same promise of just and vigorous rule as he had already done in Normandy; but in a month he was recalled by news of the defeat at Beaujé of his brother the Duke of Clarence, by a force consisting largely of Scots, commanded by the Earl of Buchan. Henry returned to France for a third campaign, and his wonted success in arms was attending him, when he was seized with illness, and died at Vincennes on the 31st August 1422, at the age of thirty-five, leaving an infant to succeed him. Henry was a deeply devout prince, temperate, just, and pure of life; yet his religion, though he was free from wanton cruelty, did not make him merciful to a conquered enemy. He followed his father, too, though apparently with reluctance, in his treatment of the Lollards; even his old companion-in-arms, Sir John Oldcastle (q.v.), was sent to the stake. He was a brave soldier, a firm disciplinarian, a brilliant general; and he died when his fame was brightest.

See works cited at HENRY IV.; Nicolas, *Battle of Agincourt* (1827); books by Church (1889), Kingsford (1901), Wylie (1914-19), Mowat (1920), Newhall (1924); *First English Life of Henry V.* (ed. Kingsford, 1911).

Henry VI., the only child of Henry V. and Catharine of France, was born at Windsor on 6th December 1421. As he was not quite nine months old when his father died, his uncle, John, Duke of Bedford, was appointed to govern France, and another uncle, Humphrey, Duke of Gloucester, to be protector of England in Bedford's absence, with a council appointed by parliament to aid and control him, the parliament declining to appoint him regent, though the late king had desired it. After twenty-four years' captivity the Scottish king, James I., was set at liberty in the hope of securing peace on the northern border. In France, the incapable Charles VI. having died, his son the dauphin assumed the title of Charles VII., and went on fighting with the English. His army, commanded by the Scottish Earl of Buchan, now constable of France, was almost annihilated by the English at Verneuil (1424). But this victory was the last great success obtained by the English in France, and their power, which could only be maintained by force, gradually crumbled away. Gloucester's marriage with Jacqueline of Hainault (1423) during the life of her husband, John of Brabant, had strained the alliance with Burgundy, which soon after lost its strongest link by the death of Bedford's wife, Duke Philip's sister, in 1432. In 1429 the siege of Orleans was raised by the French, inspired by Joan of Arc (q.v.); and after this the English power declined steadily, in spite of their having burned Joan as a witch in 1431. Henry was crowned king of England at Westminster in 1429, and king of France at Paris in 1431; but the struggle, though continued for twenty years, was seen to be desperate. Bedford, the only great and statesmanlike leader on the English side, died in 1435; Paris was recovered by the dauphin in the following year; Normandy was completely lost by the fall of Cherbourg in 1450; and ultimately, in 1453, the English were

expelled from all France (Calais excepted), greatly to the true advantage of both countries.

Disputes between Gloucester and his uncle, Cardinal Beaufort (q.v.), the powerful Bishop of Winchester, as well as war with France, prevailed during the king's minority. Besides being bodily weak, Henry inherited the mental infirmity of his grandfather, Charles VI. of France. In 1445 a wife was found for him in the strong-minded Margaret of Anjou; and in 1447 the Winchester party, supported by her, succeeded in having Gloucester arrested for high-treason. Five days later he was found dead in his bed; but that he was murdered there is no proof, and such evidence as we have tends to the opposite belief. Beaufort, who had served the state faithfully for fifty years, survived his nephew only six weeks, and after his death everything went wrong. The want of strength in the king, as well as in his title to the crown, was an invitation to every form of faction to display itself. Jack Cade (q.v.), a Sussex adventurer, probably of Irish birth, obtained temporary possession of London; but the citizens overcame him and his pillaging followers, and he was killed in Sussex. The true representative of the Mortimers was Richard, Duke of York, and he was one of the unquiet spirits of the reign. As a descendant of Lionel, Duke of Clarence, the third son of Edward III., his title to the crown was superior to that of the king, who was descended from the Duke of Lancaster, the fourth son of that monarch, and he laid claim to the crown with more or less openness, according to circumstances. His influence and address were so great that in 1454, on the occasion of the king's weak mind being entirely eclipsed, he was appointed protector by parliament. On the king's recovery he was indisposed to give up his power, and levied an army to maintain it. On 22d May 1455 the first battle of St Albans was fought, and the Yorkists were victors; the Duke of Somerset, the queen's favourite minister for the time, was slain, and the king himself was taken prisoner. This was the first battle of twelve that were fought between the Houses of York and Lancaster in the Wars of the Roses (for an account of the struggle, see *ROSES, WARS OF THE*; see also *EDWARD IV.*). A return of Henry's disorder made York again protector in 1455-56; and on his recovery the poor king vainly strove to maintain peace between the duke's faction and the queen's. Margaret headed the Lancastrian forces, and never relinquished the struggle; but in 1461 Edward IV. was proclaimed king, and in 1465 Henry was captured and committed to the Tower. In 1470 Warwick restored him to the throne, but six months after he was again in Edward's hands; and at Tewkesbury (4th May 1471) his son was slain and Margaret taken prisoner. Edward returned to London on the 21st May; and that night Henry was murdered in the Tower. Margaret was ransomed by Louis XI. in 1475, and returned to France. Henry had lost both the kingdoms to which he had succeeded, and seen all his friends die vainly for his sake. The most unfortunate of kings, his reign stands out in English history as one long disaster. He himself was a just and merciful prince, pious, pure, and generous; but the gentle and saintly scholar, with his fits of imbecility, was no fit monarch for times so rough. His highest claim to gratitude is that he founded Eton College and King's College, Cambridge.

See works cited at *HENRY IV.*; Gairdner's introduction to the *Paston Letters* (vol. i. 1872); Blacman's *Life* (c. 1510; ed. and trans. James, 1919); Gasquet's *Religious Life of Henry VI.* (1923).

Henry VII., founder of the Tudor dynasty, was born at Pembroke Castle, the seat of his uncle,

the Earl of Pembroke, on January 28, 1457. His father, Edmund Tudor, was the son of Owen Tudor, a knight of Wales, and of his wife, Queen Catharine, the widow of Henry V.; he had been created Earl of Richmond by his half-brother, Henry VI., and died before his son's birth. His mother, Margaret Beaufort, was the lineal representative of the House of Lancaster, being descended from John of Gaunt and Catharine Swinford, whose children were legitimated after their marriage. The young Earl of Richmond was thus the nearest heir, after Richard III. had murdered his nephews, the sons of Edward IV., except their sisters and Richard himself. After Tewkesbury he found asylum in Brittany, until he was invited to invade England and rescue it from the usurper. The first attempt (1483) ended in failure, and cost the Duke of Buckingham his head; but in August 1485 Richmond landed at Milford Haven, and marched across the country to Bosworth, in Leicestershire, where Richard was defeated and slain. Henry now ascended the throne; and his marriage with Elizabeth of York, Edward IV.'s eldest daughter, by which the White Rose and the Red were united, was celebrated in the following January. His reign was troubled by several impostors claiming the crown: first, Lambert Simnel, an Oxford joiner's son, who professed to be the Earl of Warwick, Clarence's son, and was proclaimed king in Ireland, but was defeated at Stoke in 1487, taken prisoner, and turned into a mental in the king's kitchen; next, Perkin Warbeck, who pretended to be the boy Duke of York, who had *not* been murdered in the Tower by Richard III., and was patronised by the Duchess of Burgundy and supported by the Emperor Maximilian and James IV. of Scotland, but was finally captured in 1497; and finally, Ralph Wilford, who also pretended to be the Earl of Warwick, but did not succeed in carrying his enterprise far, being almost at once taken and hanged in 1499. In this year Henry, to end his troubles from pretenders, had Warbeck, whom he had pardoned, and the true Earl of Warwick, a youth who had known only captivity all his days, convicted of a plot to recover their liberty, and executed. The execution of the latter is the chief blot on Henry's memory; for the execution of Sir William Stanley, deeply though the king had been indebted to him, there appears to have been ample justification.

In 1492 Henry invaded France, but was bought off with a promise of 745,000 crowns; and this was the only foreign war in which he engaged, although his successful diplomacy gave him an influence in continental politics greater than had been attained by any king of England before him. Ferdinand and Isabella's daughter, Catharine of Aragon, was married to his son Arthur, Prince of Wales, a boy of fifteen, just before he died; and Henry's policy, added to an objection to return part of her dowry, ultimately led him to betroth her to his next son, who became Henry VIII. A marriage from which flowed most important consequences was that of his eldest daughter, Margaret, to James IV. of Scotland, which a century later brought about the union of the crowns. In February 1503 Henry's queen died, and in his active endeavours to obtain a second wife, with a sufficiently large dowry, he proposed a few months later to marry his own daughter-in-law, Catharine, who had been left a widow by Arthur the year before; and in 1506 he even offered to wed her sister Juana, the insane heiress of Castile. With similar projects he was still engaged when he died on April 22, 1509, leaving behind him £1,800,000. He was a lover of peace, the friend of the church, the patron of scholarship and architecture, as well as of commerce and adventure. Bacon calls him 'a wonder for wise men,' and 'this

English Solomon, for Solomon also was too heavy upon his people in exactions.' But Henry's avarice has been exaggerated. Chiefly he was a financier, yet his legislation was wise and just. Under him the country prospered and the trading-class became more powerful, and the notorious extortions of the king's lawyers, Dudley and Empson (q.v.), did not touch the great mass of the people. Nor was the king greedy of gold for its own sake; 'to him,' says Gairdner, 'a large reserve was a great guarantee for peace and security.' According to Miss Temperley, 'the old idea of Henry as the penurious and ascetic king must be abandoned.' As a politician Henry was pitted against such cunning opponents as Ferdinand of Spain, and at least matched them all in subtlety and in foresight; and the throne which he had won he left to his son stable and secure.

See Bacon's *Henry VII.*; books by Gairdner (1889), and Busch (1892; trans. 1895); Fisher in the *Political History of England* (v. 1906); A. F. Pollard, *Reign of Henry VII.* (1913-14); Gladys Temperley, *Henry VII.* (1919).

Henry VIII. of England, the second of the Tudor monarchs, was born in 1491 at Greenwich, and ascended the throne in 1509. He was the second son of Henry VII. and Elizabeth of York, and thus united the rival claims of the Houses of York and Lancaster. Previous to the death of his elder brother Arthur, Henry had been intended for the church; and this early bent of his mind must in some measure explain his life-long interest in all matters of religious faith and church government. The affectionate admiration of his people, which with strangely little diminution he retained to the last, was due to the fact that of all English kings he was the most intensely English—mentally, morally, and physically. This enthusiasm of his people was also the natural rebound of feeling after the tame and cautious government of Henry VII., a king, in spite of all his admirable qualities, the last in the world to give rise to any such enthusiasm himself. In his earlier manhood Henry was accounted the handsomest prince of his time, though foreign observers declared that his contemporary, Francis I., bore himself with a more kingly air. In all manly exercises he could hold his own with any of his subjects. His attainments and general mental cultivation were far beyond those of his great rivals, Francis and the Emperor Charles V.; and his accession to the throne was hailed with delight by such men as Colet, Erasmus, and More, as the happiest omen for the new studies which had lately found their way into England.

At the date when Henry ascended the throne of England a ruler was needed with an energy of character and force of intelligence such as had never yet been required of any English prince. With the reign of Henry VIII. begins the modern period of European history. The beginning of the new time was marked by many circumstances that broadly distinguish it from the age that preceded it. In Henry's reign began that relation of the leading powers of Europe to each other which has continued to the present day—a relation of jealous watchfulness, that insists on a 'balance of power' as the necessary condition of the integrity of each separate state. To play his part in the new order, therefore, a range of policy was required of Henry far beyond that of even his most ambitious predecessors. In home affairs, also, questions were thrust upon him which touched the very existence of the nation. By the Wars of the Roses and the policy of Henry VII. the strength of the feudal barons had been broken, and the modern middle class had begun to be a force in the state. Had Henry been a weak ruler, however, there was still sufficient power left in the old aristocracy to have effected

at least a temporary reaction, and to have revived the disasters of the late civil wars. Above all the new time was marked by a revolutionary spirit in all questions of religion that strained to the utmost the prudence of Henry and other contemporary princes. In Henry's reign the followers of Luther found their way into all the leading countries of Europe, and by their uncompromising zeal gave the most serious alarm to the upholders of the old order. By the rise of the great rival powers, also, and by his own diminished prestige, the pope and his claims had become a question of the first political importance—a question that affected the entire development of the respective states of Europe. The question of the papal supremacy presented itself to Henry in a special form, but sooner or later it must have presented itself in one form or another, and sooner or later been decided as Henry decided it. It was impossible that the question should not arise whether certain outgrown institutions and privileges should continue in the interest of a foreign potentate, who by the very condition of his existence was now at the bidding of whatever ruler might chance to have the strongest arm. The time, in short, was one when revolutionary forces were everywhere at work; and it is only by keeping this fact before us that we can form any real conception of the most extraordinary reign in English annals.

Shortly after his accession Henry, by the advice of his council, married Catharine of Aragon, his brother Arthur's widow—a step, as it turned out, of tremendous consequence in the destinies of England. The first three years of the reign passed without any memorable event. At home, by a succession of shows and festivities, Henry at once gratified his own taste for pleasure and gained an easy popularity with his people. He also gave further satisfaction by the execution of Dudley and Empson. In 1512 the real history of Henry's reign begins. As a member of the Holy League, formed by the pope (Julius II.) and Ferdinand of Spain against Louis XII., Henry in that year began his first war by the invasion of France. The result was far from encouraging. Overreached by Ferdinand, Henry sent a body of troops to Spain, who disgraced England in the eyes of Europe by mutinying against their leaders, and insisting on being led home without striking an effective blow. The next year Henry invaded France in person, and partly retrieved the national honour at the so-called Battle of Spurs, and by the capture of Terouenne and Tournay. During his absence a greater triumph was gained for England by the disastrous defeat of the Scots at Flodden, which for several years left Henry a freer hand to carry out his continental policy.

It was in this first French war that Henry's great minister, Wolsey, began to take a prominent place in the councils of the nation; and thenceforward till his fall in 1529 the history of this reign is little else than the history of Wolsey. A servant of Henry VII., Wolsey had early ingratiated himself with his son at once by his pliant courtliness and his consummate ability in public affairs. So early as 1514 Wolsey was after the king himself the first man in the country. During the sixteen years of his administration the history of England is the history of its foreign policy. In this policy the chief aim of Wolsey and his master (for Henry even at his most thoughtless period never wholly neglected public business) was to hold in equipoise the two great continental powers, France and Spain, and by maintaining the position of arbiter to win for England an importance to which her own resources hardly entitled her. In pursuance of this aim the support of England was till 1525 given to Spain against France. In this first period of the

reign the foreign events on which the most important consequences turned were the election of the emperor in 1519, the battle of Pavia in 1525, and the sack of Rome in 1527.

From the election of Charles of Spain to the empire over Francis I. of France began that rivalry between these two princes which for a quarter of a century distracted western Europe with almost continuous war. It was of the utmost importance both to Charles and Francis what side Henry should take in the duel they saw before them. Both, accordingly, were eager in their proffers of friendship to the English king. At the *Field of the Cloth of Gold*, near Guines, in the English dominion in France, where Henry and Francis met in 1520 amid a blaze of grandeur that sorely drained the purses of both nations, a meeting took place, which, after many professions of friendship, came to nothing. Henry had hardly left Francis when he met the emperor at Gravelines, where a formal alliance between them was confirmed by the betrothal of Charles to Henry's daughter Mary, then a child of four years. The protracted struggle between Charles and Francis at once began, though the following year (1521), at Calais, Wolsey did his utmost as ambassador of England to maintain the peace of Europe. The struggle proceeded with varying success till in 1525, at the battle of Pavia, Francis was brought to the verge of ruin by his own capture and the defeat of the most powerful army he had ever led into Italy. As the ascendancy thus gained by the emperor endangered that balance of power at which Wolsey was ever aiming, England was now thrown into alliance with France. The sack of Rome by the emperor's troops in 1527 supplied Henry with still stronger reasons for joining France; and meanwhile domestic reasons were urging him in the same direction.

The leading events at home during these sixteen years may be briefly told. In 1521 the Duke of Buckingham, a descendant in the female line from the youngest son of Edward III., and, therefore, a possible claimant for the throne, was executed on a charge of treason. There was little foundation for the charge; but the death of this great nobleman showed England that Henry, in spite of all his love of pleasure, was no ruler to be trifled with, while it gave continental princes a strong impression of his unlimited power over his subjects. The same year Henry published his famous book on the Sacraments in reply to Luther, and received from Pope Leo X. the title borne by all Henry's successors—*Fidei Defensor*, 'Defender of the Faith.' To enable him to play that part in continental affairs which he desired, Henry had frequent need of supplies beyond any of his predecessors. To raise these supplies Wolsey showed his devotion to the king by taking upon himself all the odium of frequent and excessive taxation. In 1523 he demanded of the House of Commons a subsidy of £800,000, to be raised by a tax of twenty per cent. on all goods and lands. After a vigorous protest by the house Wolsey carried his point; but the resistance he had met was a serious warning that there were limits beyond which even he could not safely proceed. To the country at large he made himself still further odious by the suppression of all monasteries with less than seven inmates. As he devoted the revenues of these monasteries to educational purposes, this action was in the best interests of the country; but the monks were still popular, and the people were not yet prepared for this high-handed dealing with a time-honoured institution. In 1525 Henry's expensive foreign policy again brought him into straits for money, and again Wolsey had to face popular feeling by the proposal of an illegal tax. The tax he now proposed is known as the Amicable Loan. On all

sides it met with the strongest opposition, and Wolsey was forced to abandon his proposal, but 'people cursed the cardinal and his adherents as subversive of the laws and liberty of England.'

The turning-point in Henry's reign, as it is a great turning-point in the history of England, is the moment when the thought first occurred to him that at all costs his marriage with Catharine of Aragon must be dissolved. In taking a step which he knew to be fraught with the most far-reaching consequences to the nation Henry was determined by so many motives that it is hopeless to decide which at any one period carried it over the rest. Catharine was plain in personal appearance, cold by her natural temper, and six years older than her husband; all her children, except her daughter Mary, had died in infancy, and Henry professed (and we may believe honestly enough) to see in this the judgment of heaven on an unnatural alliance; any doubt of the legitimacy of Mary might lead to a renewal of the civil wars of the preceding century; the interest of England seemed now to point to France rather than Spain as her most advantageous ally, and Catharine did not conceal her disapproval of Henry's breach with her nephew the Emperor Charles; and, lastly, Henry had set his affections on another, Anne Boleyn, a niece of the Duke of Norfolk, who soon perceived the ascendancy she had gained, and knew how to use it for her own purpose. With such various motives behind him, Henry, with all the passionate self-will of his nature, bent himself to accomplish his end. Pope Clement VII., who after the sack of Rome had every reason to dread and detest the influence of the emperor, was at first disposed to humour Henry's desire for a divorce, and in 1528 sent Cardinal Campeggio to England to try the validity of the king's marriage with Catharine. The visit of Campeggio, whose powers had been carefully guarded, settled nothing; and the pope under pressure from the emperor revoked the case to the Roman curia. This impotent conclusion was the ruin of Wolsey, who now found himself without a friend at home or abroad. The king blamed him for the failure of Campeggio's mission; Anne Boleyn, who was now all-powerful, looked on him as the only obstacle in the way of her ambition; and Catharine regarded him as the evil counsellor, who in his policy of opposition to the emperor was the main cause of all her misfortunes. In 1529, on an indictment for breach of *præmunire*, he was stripped of all his goods and honours, and dismissed from the court in disgrace. The next year he was summoned to London on a charge of high-treason, but broken in health and spirit died on the way, professing to the last his devotion to the king. 'No statesman of such eminence,' it has been said, 'ever died less lamented.' The people, who could not appreciate what he had done for England abroad in making her a power to be reckoned with in all the councils of Europe, saw in him only the haughty and vain-glorious upstart, whose entire mode of life gave the lie to his office and profession.

The period from the fall of Wolsey to the fall of his successor, Thomas Cromwell, in 1540, is perhaps the most extraordinary, as it is, perhaps, one of the most important in all English history. During these years were broken link by link all the ties that bound England to the Papacy, and the country disparted from that system of the nations which men had come to regard as no less divinely ordered than the system of the heavens itself.

This severance of England from Rome was carried through by the parliament of 1529-36, summoned after an interval of seven years, and largely composed of the creatures of the king. Despite the coldness of the pope, Henry was as

determined as ever on his divorce, and equally determined that he would not plead his cause at Rome, which would have been a direct admission of the papal supremacy. By way of relieving the scruples of the pope to reverse the judgment of his predecessors in favour of Henry's marriage, the case was submitted to the various universities of Europe. Their verdict was not unanimous, but the majority declared that Henry's scruples were justified. The pope, however, with the fear of the emperor ever before him, would not be moved from his position; and, meanwhile, the English parliament, inspired by the king, proceeded with its work. By humbling the clergy Henry doubtless thought he would be most likely to bring the pope to terms. Accordingly, one blow after another was struck at their privileges till they were taught that their real master was not the pope at Rome, but the king of England. In 1531 the whole body of the clergy, on the same grounds as Wolsey, were declared guilty of treason under the law of *præmunire*, and purchased the pardon of the crown only by the payment of £118,840. The same year he extorted from them his recognition as 'protector and supreme head of the church and clergy of England,' and the year following abolished the system of *annates* by which the pope received the first year's income of all newly-appointed bishops and archbishops. The tendency of all these acts could not be mistaken, and Sir Thomas More, who had succeeded Wolsey in the chancellorship, and who saw the inevitable end of Henry's policy, prayed to be relieved of the Great Seal. In further defiance of Rome, Henry (1533) was privately married to Anne Boleyn, in the teeth, also, as it would appear, of public opinion, which all through had been on the side of Catharine. The year 1534 saw the definitive breach of England with Rome. By the parliament of that year it was enacted that all bishops should be appointed by a *congé d'élire* from the crown, and that all recourse to the bishop of Rome should be regarded as illegal. It was also enacted that the king's marriage with Catharine was invalid, that the succession to the crown should lie with the issue of Henry's marriage with Anne Boleyn, and that the king was the sole supreme head of the church of England. To this last act Bishop Fisher and Sir Thomas More, both men of the old order, but illustrious by their character and attainments, refused to swear, and both were executed the following year. In all his action against Rome Henry was eager that the world should understand that his quarrel was solely with the pope, and not with the doctrines of the church. The supporters of Luther, therefore, were treated with the same severity as the clergy of the old church who refused to acknowledge him in the place of the pope. To proclaim his soundness of doctrine he ordered (1537) the publication of the *Bishop's Book* or the *Institution of a Christian Man*, in which, with the exception of the headship of the pope, all the Catholic doctrines were set down after the strictest orthodoxy. It was the same anxiety to save his orthodoxy that prompted the famous *Statute of the Six Articles*, known as the *Bloody Statute*, in which all the fundamental doctrines of the Church of Rome are insisted on as necessary articles of belief—the severest penalties being attached to the denial of any one of them (1539).

In 1535, following the example of Wolsey, Henry appointed a commission under the direction of Thomas Cromwell to prepare a report on the state of the monasteries for the guidance of parliament. The report, contained in what is known as the *Black Book* (q.v.), revealed a state of things that justified the most drastic dealing. The commissioners were strongly disposed to exaggerate whatever

evils they found, and their report is to be taken for what it is worth; yet there is abundant testimony from friends and foes alike to prove that the monasteries had outlived their function, and that their general character was fitted to depress rather than elevate the moral ideal of the nation. On the strength of this report an act was passed for the suppression of all monasteries with a revenue under £200 a year. This high-handed dealing with an ancient institution brought to a head a widespread discontent with the late policy of Henry. In the north of England, especially, the sympathies of the people were mainly with the old religion, and the barons and country gentlemen were generally of the same way of thinking. The people, moreover, had a real grievance in the fact that everywhere there was much misery in the country, by reason of the land being extensively converted from agricultural to pastoral purposes, and its being bought up by speculators from the towns. The year following the suppression of the smaller monasteries, therefore, a formidable insurrection, known as the *Pilgrimage of Grace*, was organised in the northern counties under the leadership of a barrister named Robert Aske. The revolt was crushed and failed in all its objects, for the very next year Henry gave a final blow to the ancient church by the suppression of all the remaining monasteries. Henry's agent in this wholesale dissolution was Thomas Cromwell, the 'Hammer of the Monks,' who, after the king himself, was now the most powerful man in England. The removal of the monasteries was in the best interest of the country; but the manner in which Cromwell carried out the work is a revelation at once of the character of the man and the time. The revenues of the monasteries to the amount of £161,100 were devoted to small pensions for the abbots and priors, and the erection of six new bishoprics. The bulk of the revenues, however, passed to the crown and to those who had made themselves useful to the king.

We have again to return to the history of the king's marriages, which, in every case, it is to be remembered, have a more or less direct bearing on the policy of the reign. In 1536 Queen Catharine died, and the same year Anne Boleyn herself was executed in the Tower on the charge of infidelity to the king. The day after her execution Henry was betrothed to Jane Seymour and married ten days later. The only one of his wives for whom he appears to have had affection and respect, Jane died next year, leaving a son, afterwards Edward VI. The succession being in the estimation of Henry and his ministers still insecure, Anne of Cleves was chosen as the king's fourth wife, in the hope of attaching the Protestant interest of Germany. Anne's personal appearance proved so little to Henry's taste that he consented to the marriage only on condition that a divorce should follow as speedily as decency would permit. Henry's disgust with Anne of Cleves was the immediate occasion of the ruin of his great minister Cromwell. As the agent of Henry's own religious policy Cromwell had made himself as generally detested as his predecessor Wolsey. It was mainly through his action that Anne had been brought forward, and his enemies used the opportunity of Henry's indignation to effect his ruin. Accused of high-treason by the Duke of Norfolk, he was executed on a bill of attainder, without the form of a trial (1540). On the day of Cromwell's death Henry married Catharine Howard, another niece of the Duke of Norfolk, and thus seemed to lend himself to the Catholic party represented by that nobleman. Before two years had passed Catharine suffered the same fate as Anne Boleyn, on the same charge, and in her case proved beyond dispute. In

July 1543 Henry married his sixth and last wife, Catharine Parr, widow of Lord Latimer, a woman of character, who was happy enough to survive her husband.

During all these years the rivalry of Francis and the emperor had been the source of almost constant war, and Henry's interest in their struggle had been kept continually alive by the intrigues of France in Scotland. In 1543 Henry and Charles made a common invasion of France, which ended disgracefully for England by Francis and the emperor arranging a peace in which Henry's name was not even mentioned. In 1545 Francis made an abortive invasion of England, and the following year Henry retaliated by another invasion of France. At length, both monarchs being alike broken in health and spirit, they concluded a peace (1546), of which, by Francis's intervention, Scotland also had the benefit.

In his last years Henry suffered much from an ulcer in his leg, which seems at times to have goaded almost to madness a temper never very tractable or uniform. The execution of the young Earl of Surrey, son of the Duke of Norfolk, on a charge of high-treason, completes the long list of the judicial murders of Henry's reign. Norfolk himself was saved from the same fate only by the death of Henry himself, January 28, 1547.

From the revolting record of his conjugal relations and the long list of noble victims that make his rule a veritable reign of terror, Henry is apt to be hastily judged simply as an unnatural monster, borne along by motives of cruelty and lust. Yet it cannot be questioned that from first to last he was popular with all ranks of his people, and that he inspired the most devoted affection of those in immediate contact with him. 'Had Henry been the wilful, capricious, and self-indulgent monarch he is sometimes represented,' says Professor Brewer, 'the intense personal devotion of such men as Wolsey, Cromwell, More, Gardiner, and Fitzwilliam, so unlike each other in all respects, this one exception, would have been the most unintelligible paradox in history.' In the point of personal morals Henry was purity itself compared with his contemporaries Francis and James V. of Scotland. In the sense of kingly responsibility, also, he bears the most favourable comparison with the French king. Even in the shedding of blood Henry was merciful compared with Francis. In the case of the victims of the Bloody Statute, and even in the case of the deaths of such men as More and Fisher, we are bound to admit that Henry had a certain justification in principle and in the interest of the country. But in the wholesale massacre of the Protestants by Francis we have simply the gratuitous act of a monarch devoid himself of all religious conviction, prompted by the momentary caprice of selfish interest. Only a prince of the most imperious will could have effected the ecclesiastical revolution that makes Henry's reign perhaps the most important in English history. At the same time, the whole past policy of England towards Rome had its necessary result in Henry's rejection of his papal supremacy. By the law of *præmunire* the power of the pope had ceased to be more than a form, and it only required an occasion such as the divorce of Catharine, and a king with the resolution of Henry, to snap the bond that was already worn to the extremest tenuity. In the suppression of the monasteries, also, Henry in reality acted in accordance with the highest consciousness of the nation. The mass of the people were unfavourable to the revolution, but that section of the community which represented the moral sense of the nation was all on the side of Henry. It is in his manner of carrying out what was a necessary revolution, in his coarseness of

nature, which deserves the harsher name of sheer brutality, that the instinctive feeling of revulsion against Henry finds its real justification.

Henry, PRINCE OF WALES. See JAMES I.

Henry, surnamed THE LION (1129-1195), Duke of Saxony and Bavaria, was the son of Henry the Proud, and the head of the Guelphs. After Bavaria, which had been taken from his father, was restored to him (1154) by the Emperor Frederick I., he became the most powerful noble in Germany, his possessions extending from the North Sea and the Baltic to the shores of the Adriatic. His great power and his ambitious designs roused against him a league of princes, ecclesiastical and temporal, in 1166; but Henry, with the emperor's countenance, was able to make head successfully against his enemies. Frederick I. at length grew alarmed, deprived Henry of his dominions and placed him under the ban of the empire in 1180. Nor was he fully reconciled to Frederick's successor, Henry VI., until about three years before his own death. Henry the Lion pursued an enlightened policy in ruling his dominions, in that he encouraged agriculture and trade; he fostered the commerce of Hamburg and Lübeck, and was the founder of Munich. See A. L. Poole, *Henry the Lion* (1912).

Henry III., German emperor, only son of the Emperor Conrad II., was born on 28th October 1017, elected king of the Germans in 1026, Duke of Bavaria in 1027, Duke of Swabia in 1038, and succeeded his father as emperor in 1039. A man of stern though pious disposition, he resolutely maintained the imperial prerogatives of power, and encouraged the efforts of the Cluniac monks to reform the ecclesiastical system of Europe. Having summoned a council at Sutri in 1046, he put an end to the scandalous intrigues of the rival popes, Benedict IX., Sylvester III., and Gregory IV., by deposing all three and securing the election of Clement II. in their stead. In 1042 he compelled the Duke of Bohemia to acknowledge himself a vassal of the empire. The outcome of repeated campaigns in Hungary was the establishment of the supremacy of the empire over that kingdom in 1044. Henry also stretched his authority over the Norman conquerors of Apulia and Calabria. He died suddenly at Bodfeld, in the Harz country, on 5th October 1056. He was a zealous promoter of learning and the arts, especially music. He founded numerous monastic schools, over which he placed learned monks of Brittany, and built several churches, including the cathedrals of Worms, Mainz, and Spire, in the last of which he was buried. See Steindorff, *Jahrbücher des Deutschen Reichs unter Heinrich III.* (1874-81).

Henry IV., German emperor, was born at Goslar on 11th November 1050, elected king of the Germans in 1054, and succeeded his father, Henry III., in 1056, his mother being named regent of the empire. She was soon ousted by the Archbishop of Cologne, and he in turn by the Archbishop of Bremen. About 1070 Henry began to act for himself. His first care was to break the power of the nobles of the land; but his measures provoked a rising of the Saxons, who in 1074 forced upon Henry humiliating terms of pacification. In the following year he defeated them in a great battle at Hohenburg, and then proceeded to take

vengeance upon the princes, secular and ecclesiastical, who had ventured to contest power with him. The case of the latter gave the pope, Gregory VII., the pretext he longed for to interfere in the affairs of Germany, and so began the great duel between pope and emperor, between the representatives of secular and ecclesiastical power. See GREGORY VII. In 1076 Henry declared the pontiff deposed. Gregory VII. retaliated by excommunicating Henry and absolving his subjects from all obedience to him. Seeing his vassals and princes gradually falling away from their allegiance, and not neglectful of a chance to weaken the pope's position, even if at the cost of personal humiliation, the king hastened, in midwinter, to Italy to make submission to Gregory VII. For three days in January 1077 he prayed for audience of the pope outside the castle of Canossa, till he was ultimately admitted, and the ban of excommunication removed. The account which represents Henry as standing for three days in the snow, barefooted, and clad only in the haircloth shirt of a penitent, is now regarded as essentially legendary. Thereafter, having found adherents among the Lombards, Henry renewed the conflict, but was again excommunicated. His countermove to this was to appoint a new pope, Clement III., and to hasten over the Alps and lay siege to Rome. Henry in 1084 got possession of the city and caused himself to be crowned emperor by the antipope. Gregory, who had taken refuge in the castle of San Angelo, was only saved by the approach of Robert Guiscard at the head of the Italian and Sicilian Normans. In Germany, during Henry's long absence in Italy, three rival kings of the Germans successively found support amongst the princes. But Henry managed to triumph over them all. Crossing the Alps for the third time, he in 1090 restored the fortunes of his friend, Clement III., took Mantua, and was rapidly subduing the Guelphic princes and their pope, Urban II., second successor to Gregory, who had died in 1085, when he learned that his son Conrad had joined his enemies and been crowned king at Monza. The wearied monarch, disheartened by this adverse blow, retired to one of his Lombard castles, and abandoned himself to despair. But at length rousing himself from his lethargy, he returned (1097) to Germany. His second son, Henry, was elected king of the Germans and heir to the empire. This prince, however, was induced to rise against his father by Pope Pascal II.; he took the emperor prisoner, and compelled him to abdicate. The emperor escaped from his prison, and found friends and safety at Liège, where he died, August 7, 1106. Henry deserved praise for the endurance and tenacity with which he struggled against the tremendous odds arrayed in opposition to him. That he was able to stand his ground at all, considering the magnitude of the task he took in hand—to break the overweening power of the great feudal nobles of Germany and to withstand papal aggressiveness incorporated in the person of a Gregory VII.—must be reckoned success of no mean character. See Floto, *Heinrich IV. und sein Zeitalter* (2 vols. 1855-57); Giesebrecht, *Geschichte der Deutschen Kaiserzeit* (vol. iii. 4th ed. 1876); and Minckwitz, *Die Busse Heinrichs des IVten* (2d ed. 1875). Meyer v. Knonau, *Jahrbücher des deutschen Reichs unter Heinrich IV.* (1890-1907).

Henry II., king of France, was born at St Germain on 31st March 1519, was married to Catharine de' Medici in 1533, and succeeded his father, Francis I., in 1547. Although an ambitious and stout-hearted prince, Henry suffered himself to be influenced by favourites, women mostly (such as Diana of Poitiers, q.v.). Immediately after his accession he proclaimed himself of the Catholic party, and proceeded to oppress his

Protestant subjects. Through the influence of the Guises, whose sister, the dowager-queen of James V. of Scotland, sought the aid of France to support her against the English government, Henry formed an alliance with Scotland, and declared war against England, which ended in 1558 with the taking of Calais, after that city had been 210 years in the hands of the English. In spite of his Catholic proclivities, ambition made him renew the duel with the empire that his father had begun. In 1552 he concluded treaties of alliance with the German Reformers, and sent an army to aid Maurice of Saxony against the emperor. His troops captured Toul and Verdun, while Montmorency seized upon Metz. After a lull in the hostilities war was renewed in 1556. In the following year Guise's design to conquer Naples was frustrated by the generalship of Alva, whilst in the Low Countries the French under Montmorency sustained a crushing defeat at St Quentin. These reverses were followed by the treaty of Cateau-Cambresis (1559). Shortly afterwards Henry was accidentally wounded in a tournament by Montgomery, a Scottish nobleman and captain of his guard. He died from the wound on 10th July 1559. See works cited at FRANCE and CATHARINE DE' MEDICI.

Henry III., king of France, the third son of Henry II. and Catharine de' Medici, was born at Fontainebleau on 19th September 1551. On the death of Constable Montmorency he received the chief command of the army, and in 1569 gained two decisive victories over the Protestants at Jarnac and Moncontour. He showed his zeal for the Catholic cause by taking an active share in the massacre of St Bartholomew. In 1573 the intrigues of the queen-regent secured his election to the throne of Poland. But on receiving the tidings of the death of his brother, Charles IX., he fled by night from Cracow and came home to France to succeed Charles as king (1575). His reign was a period of almost incessant civil war between the Huguenots and the Catholics. The party of the latter, supported by the king's mother, and headed by Henry of Guise, formed the Holy League, the object of which was not merely to assert the undivided supremacy of Catholicism, but also to secure the reversion of the throne to the family of the Guises. Henry was quite unfitted to cope with the crisis. He showed both fickleness and want of courage in his public conduct; and in private life his days and nights were spent in an alternation of dissolute excesses and wild outbreaks of religious fanaticism. His favourite companions were a band of young men (the 'Mignons') as vicious as himself. At length in 1588 the assassination of the Duke of Guise in the king's antechamber, and of the Duke of Lorraine in prison, fairly roused the Catholic part of the nation to the utmost pitch of exasperation. The distracted king threw himself into the arms of Henry of Navarre, and the two sovereigns marched upon Paris at the head of a Huguenot army. But on 1st August 1589 Henry of France was stabbed by a fanatical Dominican named Jacques Clément; he died on the following day, nominating Henry of Navarre as his successor. With this king the male line of the house of Valois became extinct. See M. W. Freer, *Henry III., his Court and Times* (3 vols. 1858).

Henry IV., king of France and Navarre, surnamed 'the Great,' and 'the Good,' was born at Pau, 13th Dec. 1553. He was the third son of Antoine de Bourbon and Jeanne d'Albret, daughter and heiress of Henry, king of Navarre and Bearne. His father's death placed him under the sole control of his mother and grandfather, at whose court he was trained to the practice of knightly and athletic exercises, and inured to the active habits and rude

fare common to the Bearnais mountaineers. His mother, who was a zealous Calvinist, was careful to select learned men holding her own tenets for his instructors; and having discovered that a plot was on foot to remove him to Spain by force, to train him in the Catholic faith, she conducted him, in 1569, to La Rochelle, and presented him to the assembled Huguenot army, at whose head he fought at the battle of Jarnac. Henry was now chosen chief of the Protestant party—although, on account of his youth, the principal command was vested in Coligny (q.v.)—and the third of the Huguenot wars began. Notwithstanding the defeats which the Huguenots had experienced in the next campaign, the peace of St Germain which concluded it was apparently most advantageous to their cause, and was speedily followed by a contract of marriage between Henry and Margaret of Valois, the sister of Charles IX. After much opposition on the part of both Catholics and Protestants, the marriage was celebrated with great pomp in 1572, two months after the sudden death of the Queen Jeanne, which was wrongly ascribed to poison, and within less than a week of the massacre of St Bartholomew. It had been originally intended that Henry was to share the fate of his friends and co-religionists; but his life was spared on condition of his professing himself a Catholic. Three years he remained at the French court, virtually a prisoner; but at length, in 1576, he contrived to elude the vigilance of the queen-mother, and escaped to the camp of the Huguenots in Alençon. There, having revoked his compulsory conversion, he resumed the command of the army, and by his address gained several signal advantages, which constrained the king to consent to a peace highly favourable to the cause of the Reformers.

The death of the Duke of Anjou (late Alençon) gave Henry the rank, as first prince of the blood-royal, of presumptive heir to the crown; while the murder of Henry III. in 1589 made him, in right of the Salic law, and as the nearest lineal male descendant of the royal house of France, rightful king of France. As a Protestant, lying under the ban of papal excommunication, he was obnoxious to the greater part of the nation; and finding that the Dukes of Lorraine and Savoy, and Philip II. of Spain, were prepared, each on his own account, to dispute his claims, he retired to the south until he could collect more troops and obtain reinforcements from England and Germany. His nearly hopeless cause, however, gradually gained strength through the weakness and internal dissensions of the Leaguers, who, in their anxiety to circumvent the ambitious designs which Philip II. cherished in favour of his daughter (niece of Henry III.), notwithstanding her exclusion by the Salic law, proclaimed the aged Cardinal Bourbon king, with the Duke of Mayenne lieutenant-general of the kingdom, and thus still further complicated the interests of their party. In 1590 Henry won a splendid victory over Mayenne at Ivry. In 1593 the assembly of the States-general, by rejecting the pretensions of Philip II., and insisting on the integrity of the Salic law, smoothed Henry's way to the succession, although it is probable that he would never have been generally acknowledged had he not, by the advice of his friend and minister, De Rosny, afterwards Duc de Sully (q.v.), formally professed himself a member of the Church of Rome. The ceremony of his recantation of Protestantism, which was celebrated with great pomp at St Denis in July 1593, filled the Catholics with joy, and was followed by the speedy surrender of the most important cities of the kingdom, including even Paris, which opened its gates to him in 1594. The civil war was not, however, wholly put down till four years later. In the same year, 1598, peace

was concluded between Spain and France by the treaty of Vervins, which restored to the latter many important places in Picardy, and was otherwise favourable to the French king; but, important as was this event, it was preceded by a still more memorable act, for on the 15th April Henry had signed an edict at Nantes by which he secured to Protestants perfect liberty of conscience and the administration of impartial justice.

Henry was now left at liberty to direct his attention to the internal improvements of the kingdom, which had been thoroughly disorganised through the long continuance of civil war. The narrow-minded policy that had been followed during the preceding reigns had left the provinces remote from the capital very much at the mercy of the civic governors and large landed proprietors, who, in the absence of a general administrative vigilance, arrogated almost sovereign power to themselves, raising taxes and exacting compulsory services. These abuses Henry completely stopped, and by making canals and roads, and thus opening all parts of his kingdom to traffic and commerce, he established new sources of wealth and prosperity for all classes of his subjects. The mainspring of these improvements was, however, the reorganisation of the finances under Sully, who, in the course of ten years, reduced the national debt from 330 millions to 50 millions of livres, although arrears of taxes to the amount of 20 millions were remitted by the king during that period. On 14th May 1610, the day after the coronation of his second wife, Mary de' Medici, and when about to set out to commence war in Germany, Henry was assassinated by a fanatic named Ravallac. Nineteen times before attempts had been made on his life, most of which had been traced to the agency of the papal and imperial courts, and hence the people, in their grief and consternation, laid Ravallac's crime to the charge of the same influences. The grief of the Parisians was well-nigh delirious, and in their fury they wreaked the most horrible vengeance on the murderer, who, however, had been a mere tool in the hands of the Jesuits, Henry's implacable foes, notwithstanding the many concessions which he made to their order.

According to Henri Martin, Henry 'remains the greatest, but above all the most essentially French of all the kings of France.' His unbridled licentiousness was his worst fault, and the cause of much evil in his own and succeeding reigns; for his prodigality and weak indulgence to his favourite mistresses, Gabrielle d'Estrées and Henrietta d'Entragues, and his affection for the natural children which they bore him were a scandal to the nation, and a source of impoverishing embarrassment to the government.

As authorities in regard to Henry II., III., and IV., in addition to the general histories of France, the following works may be consulted: Anquetil, *Esprit de la Ligue*; Petitot's *Collection of Mémoires*; De la Saussaye, *Histoire de Blois*; *Documents de l'Hist. de France*; Matthieu, *Hist. de Henri IV.*; *Memoirs and Letters of Sully*, De Thou, D'Aubigné, Pasquier, Duplessis-Mornay; Capefigue, *Hist. de la Réforme et de la Ligue*; Péréfixe, *Hist. de Henri IV.*; M. W. Freer, *History of the Reign of Henry IV.* (6 vols. 1860-63); H. de la Ferrière's *Henri IV.* (1890); Bingham's *Marriages of the Bourbons* (1889); and monographs by P. F. Willert (1893) and E. T. Blair (Phila. 1894).

Henry V. of France. See CHAMBORD.

Henry, surnamed THE NAVIGATOR (Dom Henrique el Navegador), a famous Portuguese prince, the fourth son of João I., king of Portugal, and of the English Philippa, daughter of John of Gaunt, was born at Oporto in 1394, and first distinguished himself at the conquest of Ceuta in 1415. After the death of his father he took up his residence at the town of Sagres, in Algarve, near

Cape St Vincent; and while prosecuting the war against the Moors of Africa, his sailors reached parts of the ocean heretofore unvisited and unknown. The grand ambition of Henry was the discovery of unknown regions of the world. At Sagres he erected an observatory, to which he attached a school for the instruction of youthful scions of the nobility in the sciences necessary to navigation. Subsequently he despatched some of his pupils on voyages of discovery, which resulted at last in the discovery of the Madeira Islands in 1420. Henry's thoughts were now directed towards the auriferous coasts of Guinea, of which he had heard from the Moors; and in 1434 one of his mariners sailed round Cape Bojador, until then regarded as the farthest point of the earth. Next year Henry sent out a larger ship, which reached a point 150 miles beyond Cape Bojador; and at last, in 1441, Cape Blanco was reached. Up to this period the prince had borne all the expense of these voyages himself; henceforth, self-supporting societies were formed under his patronage and guidance, and what had formerly been the affair of a single individual now became the passion of a whole nation. But Henry did not slack personally in his efforts. In 1445 his captain, Diniz Diaz, doubled Cape Verde in Senegambia, and in 1446 Alvaro Fernandez pushed on to a point some 320 miles beyond. It was in Henry's lifetime, mostly between 1430 and 1450, that the entire group of the Azores was found.

See works by Wappäus (Gött. 1842), De Veer (Königsb. 1864), and J. P. O. Martins (trans. 1914); the *Life* and the *Discoveries* of Henry, both by Major (1868 and 1877); and a short work by Raymond Beazley (1895).

Henry of Huntingdon, English chronicler, was brought up in the household of the Bishop of Lincoln, and about 1120 became Archdeacon of Huntingdon. His *chef d'œuvre* is the *Historia Anglorum*, coming down to 1154. Besides this he wrote several epistles on historical matters and some poems. His *History* was published for the Rolls series by T. Arnold in 1880; an English translation by T. Forrester appeared in 1853. See Gairdner's *Early Chroniclers of Europe* (1879).

Henry the Minstrel. See HARRY (BLIND).

Henry, JOSEPH, physicist, was born either in 1797 or 1799, in Albany, New York. There, while apprenticed to a watchmaker, he took up the study of science, and earned means to carry him through the course at the academy, in which institution he became instructor in Mathematics in 1826. In 1832 he was called to the chair of Natural Philosophy at Princeton; in 1846 he was elected the first secretary of the Smithsonian Institution, and removed to Washington, where he died, 13th May 1878. Apart from his great services to the Smithsonian Institution, with Henry's name are associated the discovery of a relation between the number of coils of wire round the electro-magnet and the construction of the battery to work it, which prepared the way for Morse's invention, in which his principles were applied to make the instrument effective at a distance; the discovery of a singular form of electrical induction; researches in meteorology and acoustics; and the establishment of the national lighthouse board, of which he was chairman from 1871 until his death. He was LL.D. of Union (1829) and Harvard (1851), and a member of many scientific societies in America and Europe. Of his numerous papers 2 vols. were published in 1886; and a *Memorial* was published by order of congress in 1880.

Henry, MATTHEW, Nonconformist divine, the son of Philip Henry, one of the 2000 ministers who left the Church of England on the passing of the 'Act of Uniformity,' was born at Broad Oak farm-

house, in Flintshire, October 18, 1662. In 1687 he became pastor of a congregation of dissenters at Chester, where he remained until May 1712, when he removed to a charge at Hackney, near London. He died of apoplexy, June 22, 1714, at Nantwich, while on his return from a visit to his old friends at Chester. His principal work is an *Exposition of the Old and New Testament*, in 5 vols. folio (1710 and repeatedly since), which was carried down only to the Acts of the Apostles. The remainder was completed after Henry's death by various ministers, whose names are given in some of the editions. This commentary is not a critical work, but rather practical and devotional in its aim, and as such occupies a high place amongst works of its class. Henry wrote several other books, which were published at London in 1830. There are biographies of him by Tong (1716), J. B. Williams (1865), Davies (1844), Hamilton (1853), Chapman (1859), and H. D. Roberts (1902); and see the *Diaries and Letters of Philip Henry* (ed. Lee, 1883).

Henry, O. (pseudonym of WILLIAM SYDNEY PORTER), American author, was born at Greensboro, North Carolina, 11th September 1862, and was many things in turn, clerk, ranchman, book-keeper, bank-teller, editor, reporter, before achieving distinction as a masterly writer of short stories, some of the earliest of which were produced while serving a term of imprisonment (1898-1901) for alleged embezzlement. Typical collections are *Cabbages and Kings* (1904), *The Gentle Grazier* (1908), *The Four Million* (1909). He died at New York, 5th June 1910. See *Life* by C. A. Smith (1917), and work by A. Jennings (1922).

Henry, PATRICK, a great American orator and patriot, was born in Hanover county, Virginia, 29th May 1736. His father was a native of Scotland, his grandmother a cousin of Robertson the historian. Henry received a share of classical education, but at an early age entered business, and married at eighteen. Having failed successively in 'store-keeping' and in farming, he became a lawyer in 1760, and three years later found his opportunity, when, having been employed to plead the cause of the people against an unpopular tax, his great eloquence seemed suddenly to develop itself. This defence placed him at once in the front rank of American orators, and his later speeches advanced him to their head. From amid the sullen murmurs and remonstrances that the passage of the stamp-act evoked, his voice it was that first rose in a clear, bold call to resistance. Throughout the war of independence he was a zealous patriot. He was a delegate to the first Continental congress, which met at Philadelphia in 1774, and delivered the first speech in that assembly—a speech that for fiery eloquence and lofty tone was worthy of so momentous a meeting. In 1776 he carried the vote of the Virginia convention for independence; and in the same year he became governor of the new state. He was afterwards four times re-elected. In 1791 he retired from public life, and returned to his practice; in 1795 he declined the secretaryship of state offered him by Washington. He died 6th June 1799. Henry was an able administrator, a wise and far-seeing legislator; but it is as their greatest orator that his memory lives in the minds of most Americans. No one who has come after has approached him in ability to stir and sway the passions of an audience. The classical *Life* is that by William Wirt; others are Everett's, Tyler's (1887), W. W. Henry's (1891), and *The True Patrick Henry*, by George Morgan (1907).

Henry, ROBERT, a Scottish historian and divine, was born at St Ninians, in Stirlingshire, February 18, 1718. He studied at the university of Edinburgh, and from 1768 till his death in 1790

was one of the ministers of that city. In his *History of Great Britain on a New Plan* (6 vols. 1771-93) he adopted the 'new plan' of devoting chapters to the social aspects of successive periods, and thus tracing the progress of civilisation in Great Britain; but the work has no pretensions to critical acumen or even strict accuracy, and consequently is now of little value.

Henry, WILLIAM, a chemist, was born at Manchester, 12th December 1774, and died on 2d September 1836 at Pendlebury near that city. In 1795 he began to study medicine at Edinburgh, but at the end of his first session he returned home to superintend a chemical business which had been established by his father, and it was not until 1805 that he was able to resume his studies at Edinburgh. He only practised for a short time in Manchester, preferring to devote himself to original investigation in chemistry. He was the author of some very valuable papers in the *Philosophical Transactions* (chiefly on the chemistry of the gases); and his *Elements of Experimental Chemistry*, in two volumes, which was published in 1799, reached an eleventh edition in 1829. Henry was awarded by the Royal Society the Copley gold medal in 1809. The Memoirs of the Manchester Society are chiefly indebted to him and to Dalton for their high scientific character.

Henryson, ROBERT, Scottish poet, was born about 1425, and was most likely educated abroad. He is usually designated schoolmaster of Dunfermline, and he seems besides to have practised there the profession of a notary. His death may safely be put about the end of the 15th century. Of his poems the most important is his *Testament of Cresseid*, in the form of a kind of supplement to Chaucer's poem on the same subject. Another, *Robene and Makyne*, is especially interesting as the earliest extant specimen in the Scottish dialect of pastoral poetry. Other works are a metrical version of thirteen of the *Fables of Æsop*, with morals suited to the questions of the time, and the somewhat feeble *Orpheus and Eurydice*. All previous editions of Henryson's poems were superseded by that of Professor Gregory Smith (1906-15).

Henselt, ADOLF (1814-89), a pianist (with a very individual style) and composer of considerable talent who, born in Bavaria, received his musical education at Munich, Weimar, and Vienna. In 1838 he settled in St Petersburg, where he was appointed virtuoso to the empress. His concert tours were brilliantly successful. His compositions include *Études*, *Impromptu* (op. 17), and *Ballade* (op. 31), a concerto, as well as many other piano-forte pieces.

Henslowe, PHILIP, a stage-manager in Shakespeare's time, was originally a dyer and starch-maker, but became in 1584 lessee of the Rose theatre on the Bankside. From 1591 till his death in 1616 he was in partnership with Edward Alleyn (q.v.), who married his step-daughter in 1592. Henslowe's business diary from the year 1593 to 1609 has fortunately been preserved at Dulwich College, and contains invaluable information about new plays and all the stage business of Shakespeare's day. Payne Collier's edition for the Shakespeare Society (1841) is marred by interpolations and worse; it was edited anew by W. W. Greg (1904-8).

Hepar (Gr. *hēpar*, 'the liver') is the name given by the older chemists to various compounds of sulphur, from their brown, liver-like colour. *Hepatic* means belonging to the liver; as, *hepatic artery*, vein, duct, &c. *Hepatica* is a term for medicines which affect the liver and its appendages.

Hepatica, a genus of hardy perennial plants belonging to the natural order Ranunculaceæ,

closely related to *Anemone*, and generally included in that genus under the name *A. Hepatica*. *H. triloba* is the best-known species, and has long been extremely popular in the flower-garden on account of its flowering in early spring in great profusion; the flowers of the several varieties being also very brilliantly coloured. The normal colour of the species appears to be purple, but there are varieties with red, deep blue—of these there are single and double-flowered forms—and pure white flowers. It is a native of many hilly parts of Europe. Its roots are powerfully astringent, but have not the acrid qualities possessed by many of the Ranunculaceæ. *H. angulosa* is the only other species known to cultivation; it is larger in all its parts; the flowers are pale blue. It is a native of Transylvania, and both species delight in partial shade rather than full exposure to the sun.

Hepaticæ. See LIVERWORTS.

Hepatitis (Gr. *hēpar*, 'the liver'), inflammation of the Liver (q.v.).

Hephæstus, the god of fire and of smithy among the Greeks, is represented by Homer as lame, walking with the aid of a stick, and panting as he goes. His character is good-tempered, affectionate, and compassionate (cf. *Æsch. Prometheus Bound*). There is also an element of the comic connected with him; his gait and ungainly figure provoke the laughter of the gods. On the other hand, he is himself given to practical jokes; he constructs a seat on which his mother sits down, but from which she is unable to rise. His mother was Hera, who (according to Homer) liked her lame child so little that she cast him far out from heaven. Another account of his fall from heaven is also given by Homer—that Zeus threw him out for siding with Hera against him. The story of the seat just mentioned is brought into connection with the former version of his fall; none but he could release Hera, nor would he help her until restored to his place in heaven. Mythologists interpret the fall of Hephæstus as the fall of lightning from the sky (= Hera, but see HERA). Amongst the myths in which Hephæstus is concerned we must mention that of the manufacture of the first woman, Pandora (by whom all evil came into the world); the birth of Athene from the head of Zeus, when Hephæstus with an axe acted as midwife; and the birth of Erichthonios, who claimed Hephæstus for father, and from whom the Athenians counted themselves as descended.

In discussing the origin and antiquity of Hephæstus it is necessary to bear in mind that this deity appears under two aspects, which would naturally come to be combined though they were not necessarily united from the first. Hephæstus is the god of smithy and also the god of fire. To begin with the latter aspect of the deity, there are so many points of resemblance between the divine smith of the Greeks and the Wayland Smith (q.v.) or Wieland or Volundr of the northern members of the Indo-European family of peoples that some comparative mythologists have felt justified in inferring that the divine smith was a conception known to the Indo-Europeans before their dispersion. On the other hand, it is maintained that the resemblances are due, not to the joint inheritance by different peoples of the same original myth, but to borrowing at a late period. The stories of Wieland were a conscious loan on the part of the Teutons, in the 6th century A.D., of various classic tales about Dædalus and Vulcan (W. Golther, *Germania*, 2d. xxiii. 449). This latter view has in its favour the fact that the undivided Indo-Europeans were unacquainted with the metals, except copper, and totally ignorant of the art of smithy. The divine smith, therefore, is a mythological conception which must be posterior to the dispersion of

the Indo-Europeans. Remains the question then whether the other aspect under which Hephaestus appears, that of the god of fire, goes back to primeval times. On the one hand, other Indo-European peoples have fire-gods of their own; the Hindus Agni, and the Norsemen Loki. But, unfortunately, there is no phonetic identity between the names of the various deities. We have therefore nothing beyond general considerations to guide us. The want of philological equivalence in the names of various fire-gods makes rather against the supposition that the primitive Indo-Europeans recognised a god of fire. On the other hand, there is no improbability inherent in the assumption that they were at least as far advanced as the Australian aborigines who worship fire. The fact that several members of the Indo-European family agree in the worship of a fire-god does not, of course, demonstrate that the worship was a joint inheritance, for the worshipper's idea of worshipping so useful an element occurs independently to peoples who cannot be supposed on any theory to be connected. The name Hephaestus does not seem to be Indo-European. Finally, the lameness of Hephaestus may be an expression of the unsteady, flickering motion of flame; but it is well to remember that amongst savages the people to whose lot it particularly falls to tend the fire are the lame. Hephaestus was specially worshipped in Lemnos, where he fell. In Athens he was associated with Athena.

Hephaestus was by the Romans identified with their own fire-god Vulcan (q.v.).

Hepplewhite, GEORGE, a famous English cabinet-maker and designer of furniture, about whom little is known save that he died in 1786. His fame rests chiefly on the beautiful inlaid work which he produced, but it is difficult in the extreme to identify definitely a particular piece as the work of Hepplewhite, as it is recognised that the name represents a school rather than a man. With Clippendale and Sheraton he created a taste for artistic beauty in furniture, which at its best was light and full of distinction, although it often degenerated into uninspired ugliness.

Heptam'eron. See MARGARET OF NAVARRE.

Heptarchy, the name sometimes applied to the seven kingdoms supposed to have been established by the Saxons in England. The term is completely misleading if it be taken to mean that there were neither more nor less than seven distinct kingdoms in the country down to the time of Egbert; but is permissible enough if taken to mean only that the chief kingdoms at various periods from the 5th to the 9th century were Wessex, Sussex, Kent, Essex, East Anglia, Mercia, and Northumbria (see ENGLAND). The shadowy sovereignty of the Bretwalda is discussed under that head.

Heptateuch, a word sometimes used for the first seven books (Gr. *hepta*, 'seven'; *teuchos*, 'instrument', 'volume') of the Old Testament—formed on the analogy of Pentateuch and Hexateuch. See BIBLE.

Hera, the daughter of Kronos, the sister and at the same time the wife of Zeus, was the Greek goddess of marriage, child-birth, and menstruation. In the *Iliad* she takes the part of the Greeks, and hates the Trojans, because Paris awarded the fatal apple of discord to Aphrodite. She is the mother of Hephaestus, the god of fire, of Ares, the god of war, of Eileithyia, of Hecate, and of Hebe. Three towns, according to Homer, are especially dear to her—Argos, Sparta, and Mycenæ. She is represented by the poet as jealous and ill-tempered. As the goddess of lawful marriage she persecutes the illegitimate offspring of her consort Zeus, such as Heracles and Dionysus. She conspires against

Zeus, who makes reprisals by hanging her up from heaven with golden fetters on her hands and a couple of anvils on her feet. In consequence she subsequently preferred to thwart him secretly rather than defy him openly.

Many interpretations of this figure in mythology have been given in ancient and in modern times: Empedocles and Euripides regarded her as the goddess of the earth; Plato, and after him the Stoics, as the goddess of the clouds. In modern times she has been regarded as the goddess of the lower air, which is, like Juno in Virgil, *varium et mutabile semper*, in contrast to Zeus, who is the god of the serene and upper ether. Roscher (*Stud. z. Vergl. Myth. d. Griechen u. Römer*) interprets her as a moon-goddess of Græco-Italian times. He bases this view on the fact that she resembles all other moon-goddesses in being the goddess of women, and in presiding over menstruation and child-birth; in possessing as her attributes the torch, the bow, and the crown of stars; in the fact that the new moon was the time for her festivals, and finally, on the resemblance between Hera and Juno. As regards the resemblance between these two goddesses, they are each the spouse of the supreme god of the sky, they have the same functions relatively to women, their cult and attributes are similar; and finally, the ancient Epirotic name for Hera was Dione, which corresponds phonetically to Juno.

The ancient identification of Hera with the earth may at once be dismissed. There is no resemblance between Hera and Gaia, or any other chthonian (earth) deity. Nor can she be regarded as a goddess of the lower air: goddesses of the air are unknown to any related people, and no primitive tribe (or any other tribe than that of mythologists) would distinguish between the lower air and the serene ether. If it is an unalterable canon of mythology that all deities must be nature-myths of some kind, then Roscher's interpretation of Hera as a moon-goddess is the most probable. Otherwise we may be content to seek the origin of Hera simply in the necessity under which the worshippers of Zeus lay of providing him with a spouse. And here it becomes a point of some importance to determine at what period Hera was created—whether before the dispersion of the Indo-Europeans, or after their dispersion, and while the joint-ancestors of the Greeks and Italians yet lived together in a Græco-Italian period, or in purely Greek times. Now, no one claims that Hera dates from before the dispersion of the Indo-Europeans—i.e. from the time when Zeus, though the supreme god, was still to the average Indo-European mind also and always the sky. Nor can Roscher be said to have made out his case for the Græco-Italian origin of the goddess: the fact that Dione in one part of Greece was once the supreme goddess, and was dethroned by Hera, is not enough to prove that Hera was generally, or indeed ever, known as Dione; and, further (to say nothing of the fact that Diana rather than Juno is the phonetic equivalent of Dione), there is no identity between the mythological functions of Dione and Juno on the one hand, or of Dione and Hera on the other. As for the resemblances of Hera and Juno, they are not greater than might reasonably be expected: Greeks and Italians, alike inheriting the sky-god (not from a Græco-Italian period, the very existence of which is doubtful, but from primitive times), would alike feel the necessity of providing him with a wife; and if in both cases the wife of the supreme god came to be regarded as the goddess of marriage, and of all appertaining to it, the coincidence is not astonishing when we reflect on the considerable similarity between the two peoples. If then Hera does not date from before purely Greek times, the necessity for interpreting her as a nature-myth is

considerably weakened, for as long as Zeus was but the sky we should expect that he could only be married to some nature-power; but when the personality of the god had come to be usually conceived apart from the element from which he originated, we should expect that his consort would be in mythology what she undoubtedly was in art—merely the feminine counterpart of the supreme deity. And, finally, on this view Hera's resemblance to moon-goddesses would be the result of her position as the goddess of marriage, instead of her position as the goddess of marriage being the result of a lunar origin.

Heracleia, an ancient city of Magna Græcia, situated near the river Aciris, about 3 miles from the Gulf of Tarentum. It was founded about 432 B.C., and under the Romans became a prosperous and refined city, though it never acquired any historical prominence. Near it, however, Pyrrhus defeated the Romans in 280 B.C. In the neighbourhood, besides a large number of coins, ranking among the very finest relics of antiquity, there have been discovered (1753) two bronze tablets (*Tabulæ Heracleenses*), containing a copy of the *Lex Julia Municipalis* (45 B.C.), and forming one of the principal authorities for a knowledge of the municipal law of ancient Italy. Two other cities of this name deserve mention: (1) **HERACLEIA MINOA**, between Agrigentum and Selinus, on the south coast of Sicily, originally a Phœnician town; and (2) **HERACLEIA PONTICA**, now Ereğli, on the coast of the Black Sea in Bithynia, destroyed by Cotta in the Mithradatic war.

Heracles. See **HERCULES**.

Herac'lian, an officer of the Emperor Honorius (q.v.), who as governor of the province of Africa rendered good service during the invasion of Alaric. He became consul, but, revolting against Honorius, was defeated on invading Italy (413 A.D.), and slain soon after in Africa.

Heracli'dæ means, in its widest sense, all 'the descendants of Heracles' (Hercules), but is specially applied to those adventurers who, founding their claims on their supposed descent from the great hero (to whom Zeus had promised a portion of the land), were said to have joined the Dorians in the conquest of the Peloponnesus. Several expeditions were undertaken for this purpose, the last and greatest occurring eighty years after the Trojan war. The chiefs of the invaders defeated Tisamenus, son of Orestes, and grandson of Agamemnon, and took possession of the Peloponnesus. See **GREECE**.

Heracli'tus (Gr. *Hērakleitos*), a Greek philosopher, was born at Ephesus, in Asia Minor, and flourished about 500 B.C. He is said to have resigned the hereditary office of 'king' of his native city in favour of his younger brother, and to have given himself up to a life of solitary contemplation. In the old traditions he was called, from his gloomy way of looking at things, 'the weeping philosopher,' in contrast to Democritus, 'the laughing philosopher.' He died at the age of sixty. The result of Heraclitus' meditations was a work *On Nature*, of which only a few obscure fragments remain. The fundamental tenets in his philosophy are that all things are in a constant flux of becoming and perishing, that fire is the primordial principle of all existence, that the supreme law of existence is the harmony resulting from the operations of universal reason.

For writings, see *Heracleti Ephesi Reliquiæ* (ed. Bywater, 1877). See also Zeller, Gomperz, Burnet on the old Greek philosophers, books on Heraclitus by Lassalle, E. Pfeiderer, Schäfer, Spengler.

Heracli'us, a Byzantine emperor (610-41), of splendid but fitful genius, was born in Cappadocia about 575 A.D. In 610 he headed a revolt against the tyrant Phocas, slew him, and ascended his throne. At this time the empire was in great straits: the Avars threatened it on the north-west, and the Persians invaded its frontiers from the Euxine to Egypt. The armies of Khosrau (Chosroes) II. captured Damascus in 613, and in the following year Jerusalem, from which they carried off the sacred cross; then Syria and Egypt were conquered, and the whole of Asia Minor to the gates of Chalcedon, over against Constantinople. At length Heraclius bestirred himself, and, having in 620 concluded a treaty with the Avars, set about disciplining an army. Two years later he took the field against his eastern enemy, and in a series of most brilliant campaigns utterly routed the generals of Persia several times in battle, won back his lost provinces, shut up Khosrau II. within the walls of his strong capital of Ctesiphon (628), and compelled him to restore the true cross, which Heraclius solemnly carried back to Jerusalem in 629. Two years later a new and more formidable enemy appeared in the south-east—viz. the followers of Mohammed, who speedily won from the Christian emperor nearly all that he had gained from the Persians, the people of Asia Minor alone opposing any resistance to their impetuous enthusiasm of conquest. Meanwhile Heraclius wasted his time within his palace at Constantinople in inexplicable inactivity, partly in reprehensible self-indulgence, partly in theological disputes. He died in 641, leaving the throne to his son, Constantine III. See Finlay's *History of Greece*, and Bury's *Later Roman Empire*.

Herald (Old High Ger. *hariold*—i.e. *hari-wald*, 'army strength'), an officer who was in early times the messenger of war and peace between sovereigns, and of defiance and courtesy between knights, his office also including the superintendence of jousts and tournaments, and the regulation of public ceremonies. When the bearing of coat-armour came to be reduced to a system its supervision became in France, England, Scotland, and some other countries one of the functions of the herald. A herald was generally attached to every order of knighthood. Heralds had their attendants, called *pursuivants*, who were presumed to be learning the duties of a herald. Both had official titles; and often not only sovereigns, but the greater nobles, had their heralds and pursuivants. English records and chronicles of the 14th and 15th centuries contain allusions to York, Windsor, Chester, Lancaster, Arundel, Clarencieux, Leopard, and other heralds, and to Falcon, Portcullis, Antelope, and other pursuivants; and in Scottish records of the same date the heralds mentioned include Lyon, Rothesay, Marchmont, Snowdown, Ilay, and Albany, and the pursuivants Carrick, Diligence, Unicorn. In France, England, Scotland, Burgundy, and some other countries the chief of the heralds acquired the title of *King-of-arms*, and had more or less a judicial power of regulating the bearing of coat-armour. The office of *Montjoie roi d'armes* in France is as old as the 13th century. In England in the reign of Edward III. there were two kings-of-arms—Norroy and Surroy—the jurisdiction of the one being to the north, the other to the south of the Trent. The designation Surroy was changed by Henry V. to Clarencieux. And the same king instituted a new king-of-arms called Garter, who was to be connected with the order so called, and to be principal king-of-arms of England. In Scottish records mention first occurs of Lyon King-of-arms (who took his title from the lion in the royal shield) in the beginning of the 15th century. The title of Ulster King-of-arms was created in the reign of Edward VI.; but there existed an Ireland King-of-arms at an earlier date. Certain fees were

secured to the English kings-of-arms and heralds in connection with public ceremonials and creations of peers in 1408; and in 1483 Richard III. incorporated them into a collegiate body, known as the Heralds' College, or College of Arms, presided over by the Earl Marshal (whose office is hereditary in the family of the Duke of Norfolk), the other officers including Garter, principal king-of-arms, with Clarencieux and Norroy under him, besides six heralds, named Chester, Windsor, Lancaster, Richmond, York, and Somerset, and four pursuivants, Bluemantle, Portcullis, Rouge Dragon, and Rouge Croix. A residence was at first granted to the heralds, called Cold-harbour or Pulteney's Inn, in the parish of All Saints; and in 1554 Queen Mary gave them a building opposite St Bennets, which was rebuilt after the great fire of 1666, and is still the official residence of the officers of arms and depository of their archives. Heralds extraordinary are sometimes appointed by the crown, who are not members of the Heralds' College.

The College of Arms has no jurisdiction out of England. Functions similar to those which the English kings-of-arms exercise under the Earl Marshal are discharged by Lyon King-of-arms in Scotland, and Ulster King-of-arms in Ireland, directly under the crown. There are under Lyon three heralds, Rothesay, Marchmont, and Albany, and three pursuivants, Unicorn, Bute, and Albany; their duties are chiefly connected with public ceremonials and royal proclamations. Lyon's armorial functions are exercised alone, as judge in the Lyon Court, where, however, the clerk of court or his deputy is sometimes a herald.

A tabard with the royal arms embroidered on both sides of it has long been the official dress of heralds and pursuivants. The tabards of the kings-of-arms are richer in material. The insignia of the latter also include a crown, a baton or sceptre, and a chain with a medal or badge attached to it.

Heraldry is in its original and more comprehensive sense the knowledge of the whole multifarious duties of a Herald (q.v.); in the more restricted signification in which the term is used by most modern writers, and that assigned to it in the present article, it is a knowledge of the laws that regulate armorial insignia—i.e. the devices that appear on shields, with their attendant crests, supporters, and badges. After occupying for ages the attention of the learned, and forming an important branch of a princely education, this study fell for a time into neglect and disrepute, and was abandoned to coach-painters and undertakers, a degradation owing in part to the endless tissue of follies and mystifications with which it had been interwoven. Modern criticism has rescued heraldry from these pedantries and absurdities, and imparted to it a new interest as a valuable aid to historical investigations.

Instances occur in remote times of nations, tribes, and individuals distinguishing themselves by particular emblems or ensigns—e.g. the standards of the twelve tribes of Israel, of the Egyptians and Assyrians, and the Roman eagle and cohort ensigns. Figures, symbolical and ornamental, singularly like some of those of heraldry, are found mixed with other emblems in Egypt, China, India, Japan, on Etruscan vases, and on Greek coins; and shields decorated with devices are described by both Homer and Æschylus. Yet there is exhaustive negative evidence that nothing that can be properly called armorial devices were used either on shields or banners before the middle of the 12th century. The shields of the French knights in the first crusade presented a plain face of solid metal, nor is there any certain evidence of armorial bearings having been in use in the second crusade, 1147 A.D. The representation of the Norman invasion and conquest

of England on the Bayeux Tapestry (q.v.) contains on the shields of both Saxons and Normans figures of a semi-armorial character, including dragons, crosses, roundels, irregularly arranged, also stiped banners; but there is no attempt to individualise the arms of the different heroes of the fight. Yet the rude devices on these shields seem to have been the precursors of systematic armory; and in the later half of the 12th century similar figures began to assume the permanent or hereditary character which is essential to the idea of armorial ensigns. Their use began with the French and Germans, and soon spread from France to England. The other nations of Europe followed; and their nearly simultaneous adoption seems to have been in part the result of the intimate intercourse which the crusades brought about between the chief sovereigns and warriors of Europe. Tournaments helped to bring arms into fashion, and before long the bearing of hereditary arms on shields and bannets became one of the most prominent features of medieval life. Some sort of armorial insignia were certainly depicted on the shields borne in the third crusade, which took place in 1189; and in the same century originated the fleurs-de-lis of France, and the lions or leopards of England. In the 13th century the practice was introduced of embroidering the family insignia on the surcoat worn over the hauberk or coat of mail, whence originated the expression *coat-of-arms*. Arms were similarly embroidered on the jupon, cyclas, and tabard, which succeeded the surcoat, and also enamelled or otherwise represented on furniture, personal ornaments, and weapons. Sealing had, before the introduction of heraldry, become a legal formality necessary to the authentication of a deed, and from the 13th century onwards the seals of all persons of noble or gentle birth represented their armorial ensigns (see SEAL). Those seals, appended to charters, are among the most valuable materials for tracing the history of heraldry, though they labour under the disadvantage of not indicating colours, as the arms on painted windows do.

Among important adminicles for the study of English heraldry are certain extant rolls or records of arms of the times of Henry III., Edward I., Edward II., Edward III., and also of later reigns, in the British Museum, Heralds' College, and elsewhere—a good many of which have been published or privately printed. The earliest of these, of date 1240 to 1245, show that heraldry had at that date been reduced to a systematic shape. In most cases the arms on these rolls are verbally described; in a few instances they are drawn. Along with the rolls of arms may be classed a heraldic poem known as the *Roll of Cuerlaverock*, in which are recited in Norman-French the names and arms of the knights-banneret who were present at the siege of that fortress in 1300. It was edited by Sir Harris Nicolas (1823), and by Thomas Wright (1861). Only a little later in date is a manuscript armorial of all Christendom, the work of a Flemish herald of the middle of the 14th century, preserved in the Royal Library at Brussels, in which the shields are beautifully illumined in colours, with, in many cases, the addition of helmets and crests; it has been reproduced in fac-simile by M. Bouton. A valuable Swiss roll of the same century has been fac-similed in the same way by the Antiquarische Gesellschaft of Zurich. Authentic materials of this kind enable us to trace the steps by which the usage of arms reached the still more systematised form which it assumes in the works of the established writers on heraldry. In the hands of these authors, the earliest of whom wrote at the end of the 14th century, the historical part of the subject had been obscured by a tissue of fictions, which had a very misleading effect down to a quite

recent time. The arms assigned to our forefathers Adam and Noah, to the old Jewish and pagan worthies, and to the Apostles, have long ceased to be believed in; but till a very recent date the coats of Edward the Confessor and of William the Conqueror were regarded as thoroughly historical. No less spurious than the arms of Edward the Confessor are those given by George Ruxner, herald to the Emperor Maximilian I., in his *Thurnierbuch* to knights of Germany of the 10th century, and his *Leges hastiludiales* of Henry the Fowler, who flourished two hundred years before the earliest germs of heraldry, one of which laws made it imperative for the combatants in tournaments to have borne 'insignia gentilitia' for four generations. These laws of Henry the Fowler have imposed not only on the German armorialists of the 18th century, but on Mr Ellis, who in his ingenious plea for the antiquity of heraldry, appeals to them with full faith in their genuineness. Modern German critics, however, reject them as a palpable forgery.

In the infancy of heraldry every knight seems to have assumed what arms he pleased. Animals, plants, imaginary monsters, things artificial, and objects familiar to pilgrims and Crusaders, were all fixed on; and whenever it was possible, the object chosen was one whose name bore sufficient resemblance in sound to suggest the name or title of the bearer of it. The charge fixed on was used with great latitude, singly or repeated, in any way which the bearer of the shield chose, or which the form of his shield suggested. But as coats-of-arms multiplied, different knights occasionally fixed on the same symbol, and the confusion which arose from the similarity of coats-of-arms could only be obviated by a restraint being placed on the bearer's fancy, and regulations being introduced regarding the number, position, and colour of the charges, and the attitudes of the animals represented. As heraldry became more and more consolidated into a system, the true origin was lost sight of, and the fertile imagination of the early armorialists led them to invest the most common charges with mystical meanings, and to trace their original adoption to the desire of commemorating the adventures or achievements of the founders of families. The legends ascribing an origin of this kind to early armorial bearings have, wherever it has been possible to investigate them, proved fabrications. For the first few centuries of the existence of heraldry a very large number of the insignia, both of families and of kingdoms, were, as already remarked, *armes parlantes*, though the allusion can now in many cases be traced with difficulty. The lion of Leon and Louvain, the castle of Castile, the bear of Berne, the column of the Colonna family, are well-known continental examples; and in England we have three fountains for Wells, a whirlpool (gorges) for Gorges, a calf for Vele. At the same time commemorative heraldry, which became common in later times, was not absolutely unknown in the 14th century, one of the earliest instances being the heart introduced into the Douglas coat, in memory of the pilgrimage of the good Sir James with the heart of his royal master, found on the seals of the Douglas family as early as 1356.

As no two families in the same kingdom were allowed to bear the same arms, the right to bear a particular coat sometimes became a matter of fierce dispute. It lay in England with the constable and marshal, as judges in the Court of Chivalry, to decide questions of this kind, with a right of appeal to the king; and one of the most famous contests before them was that between the families of Scrope and Grosvenor, in 1385, for the right to bear the coat azure, a bend or; when John of Gaunt was one of the witnesses examined, and the undifferentiated coat was adjudged to Scrope.

In course of time the right to use a coat-of-arms became, like the *jus imaginum*, the distinctive privilege of the noble, the word being used here in the continental sense, analogous to the English Gentleman (q.v.); and the privilege transmitted to all his descendants in the male line. When a prince made a plebeian noble, as it was competent for him to do, the patent of nobility defined what arms he was to bear.

In England a proclamation of Henry V. restrained the private assumption of armorial insignia, by prohibiting all who had not borne arms at Agincourt to assume them, except in virtue of inheritance or a grant from the crown. On the establishment of the Heralds' College (see HERALD) in 1483, the regulation of matters armorial was to a large extent delegated to the kings-of-arms and heralds acting under the Earl Marshal. Periodical visitations of the different counties were directed to be made to take cognisance of the arms, pedigrees, and marriages of the nobility and gentry of England. These visitations went on at varying periods from 1528 down to 1704, and are the principal source of evidence as to the hereditary right to bear arms in England. Among the functions exercised by the English kings-of-arms (the chief of whom is Garter King-of-arms) are the assigning of appropriate insignia to persons who have acquired a social importance that entitles them to take their place among the gentlemen of coat-armour of the country. Lyon King-of-arms, besides being a judicial officer having cognisance of all questions regarding the right to arms, exercises by direct delegation from the crown similar functions in the case of Scotsmen in the way of granting arms to *novi homines*; as does Ulster King-of-arms in the case of Irishmen. The wrongful assumption of arms is still in Scotland, if not in England, an act for which statutory penalties can be enforced against the assumer.

While there is nowhere on the Continent an institution similar to the English Heralds' College, there still exists (or did till lately) in Prussia, Austria, Bavaria, Russia, Holland, and Belgium, and some other continental countries, a direct supervision of armorial insignia, which takes place through the chancery of the orders of the kingdom. In Sweden and in Norway the abolition of titles of nobility has made the administration of armorial matters more lax, though the preservation of the orders of knighthood implies a chancery or office of regulation so far as they are concerned. In France there is now no *juge d'armes*; and spurious heraldry figures largely on carriages and elsewhere in Paris. In the United States the stars and stripes are said (erroneously, it would appear; see FLAG) to be derived from the arms of Washington; and it is not unusual for individuals and families to trace their descent from old-world houses, and to assume the arms proper to their name. So in the British dominions.

Not only families, but kingdoms, feudal lordships, towns, episcopal sees, abbeys, kings-of-arms in their official capacity, and corporations may by heraldic usage bear arms. The arms of two or more states ruled by one sovereign prince are marshalled together quarterly or otherwise in one escutcheon; and it has been the practice of many sovereigns to marshal along with their own arms of dominion, arms of territories of which they are not in possession, but to which they claim a right. Thus, England bore the arms of France from the time of Edward III. till 1801; and the kings of Naples and of Sardinia were in use to bear the arms of Cyprus and of Jerusalem. Similarly it has been the practice of the Dukes of Athole and Earls of Derby, as having been lords of Man, to quarter the arms of that island; and feudal coats are borne

quarterly and *en surtout* by various peers of Scotland. As to honourable additions to arms granted by sovereigns, see AUGMENTATION.

While family arms transmit in the male line to the descendants of the bearer of them, to be borne by cadets with recognised differences, an heiress in the heraldic sense—i.e. a daughter who represents her father, conveys her arms to her husband (provided he be himself a gentleman of coat-armour) to be marshalled in accordance with certain rules with his own. Occasionally the arms of a great heiress are allowed altogether to supersede the paternal coat; and sometimes a successor who is a stranger in blood has been empowered to assume adoptive arms to fulfil the wish of a testator.

Heraldry is thus, in one of its aspects, a faithful chronicler of the history both of royal dynasties and of private families. Every change in the hereditary succession of a kingdom, every union of two houses by marriage, occasions a corresponding change in the coat-of-arms; the position which the members of a house occupy in the family tree is duly indicated, and an armorial shield is thus a record whose nice distinctions indicate to all who understand its language, a number of material facts regarding the owner of it. Heraldry is in this way an aid to the study of history, general and local. It has often afforded the key to questions of disputed succession; and seals, baronial and monumental carvings, and shields in church windows, have all been recorded in courts of law as evidence in obscure questions of marriage and descent.

The Shield.—A coat-of-arms is composed of charges depicted on an escutcheon representing the old knightly shield. The word 'escutcheon' is derived from the French *écusson*, which signified a shield with arms on it, in contradistinction from a shield generally. The forms of the shield represented in heraldry, as in war, differed at different times. The actual shields of the 11th and 12th centuries were in shape not unlike a boy's kite

Fig. I.—Shields.

They were curved to encircle the body, and in some early seals are so represented; but, after heraldry began to be systematised, we generally find them engraved on seals and monuments as if flattened, to let the armorial design be fully seen. The pear-shape (1, fig. I.) represented in a few early shields, was soon followed by the flat-iron or heater-shape (2), which prevailed in the 12th and 13th centuries, with an increasing tendency to bulge towards the base, more especially after the introduction of the practice of quartering. When helmet, or helmet and crest, were represented, the shield was often placed in the position called *couché* (3), as if suspended from the helmet by the sinister chief angle. Towards the end of the 15th century appeared such forms as 4 and 5, where the notch is meant to represent a rest for the knightly lance. In the 16th century the forms used became more florid (6), but with considerable variety. The forms in use in the 17th and still more the 18th century, became

gradually more and more tasteless and unmeaning, the least offensive being perhaps the vair-shaped shield (7). In France and Germany the shield most in use is very wide at the base, so as to afford sufficient room for the display of quarterings or small charges. In Spain the favourite type of shield has always been one with rectangular sides and a segment of a circle for the base. The shield of an unmarried lady or widow is of a lozenge-shape (8).

To facilitate the description, or as it is called blazoning of arms, the different points or positions on the escutcheon have received technical names. English heralds generally enumerate them as nine: A (fig. II.), the dexter chief point; B, the middle chief; C, the sinister chief; D, the honour or collar point; E, the fess point; F, the nombril or navel point; G, the dexter base; H, the middle base; and I, the sinister base point. To these may be added K, the dexter flank, and L, the sinister flank. It will be observed that the dexter and sinister sides of the shield are so called from their position in relation to the supposed bearer of the shield, not of the spectator.

Tinctures.—Coats-of-arms are distinguished from each other not only by the charges or objects borne on them, but by the colour of these charges, and of the field itself. The field may be of one colour, or of more than one, divided in various ways to be noticed below. *Tincture* is the more proper armorial expression than colour, as the surface of a shield or of an armorial figure may be of a metal, or a fur, as well as of a colour strictly so called.

Fig. III.—Tinctures.

The nomenclature of these three classes of tinctures, as of heraldry generally, is an adaptation of Norman-French. The metals in use are two—gold, termed *or*, and silver, *argent*, often represented in painting by yellow and white. The colours are five—red, blue, black, green, and purple, known as *gules*, *azure*, *sable*, *vert*, and *purpure*. A charge represented not of any of these conventional heraldic tinctures, but of its natural colour, is said to be *proper*. In uncoloured heraldic engravings, it has been found convenient to have a mode of representing colours and metals by hatched lines and dots, which is shown in fig. III.; an invention not older than the 17th century. *Or* is represented by dots; for *argent*, the field is left plain; *gules* is denoted by perpendicular, and *azure*, by horizontal lines; *sable*, by lines perpendicular and horizontal crossing each other; *vert*, by diagonal lines from dexter chief to sinister base; and *purpure*, by diagonal lines from sinister chief to dexter base. The original furs in use were *ermine* and *vair*. The former is represented by black spots resembling those of the fur of the animal called the ermine, on a white ground. *Vair*, said to have been taken from the fur of a squirrel, bluish-gray on the back, and white on the belly, is expressed (at

least in the more modern heraldry) by blue and white bells or panes in horizontal rows, as shown in the figure. As the number of coats increased, various modifications of these furs were introduced, including *ermine*, or ermine with the field black and the spots white; *ermineois*, with the field gold and the spots black; *ermineites*, with a red hair on each side of the black spots; *pean*, with the field black and the spots gold. *Potent* is a crutch-shaped form of vair, as represented in the figure, and it also has occasional varieties which need not be noted at length. When vair is composed of any other tinctures than argent and azure, it is blazoned *very* of these tinctures, and is more strictly a field divided by partition-lines than a fur.

Charges.—Everything depicted on the field of the escutcheon is called a *charge*, and is supposed to stand out in relief on it; and as a general rule, a shield-of-arms has one or more charges. A few exceptional cases occur in continental heraldry of an uncharged shield of one of the metals, colours, or furs; and even in British heraldry there are, as will be seen, cases where a field consisting of metal and colour divided by partition-lines is uncharged. It is an established rule of heraldry that metal should not be placed on metal, nor colour on colour. A remarkable transgression of it occurs in the arms of the kingdom of Jerusalem founded by the Crusaders, which are argent, a cross potent between four crosses or. A recognised exception exists wherever a charge lies over a field partly of metal and partly of colour, or where an animal is (see *infra*) armed, langued, attired, unguled, beaked, membered, crowned, collared, or chained of a different tincture from that of his body. One charge of colour may surmount—i.e. partly cover, another of colour on a field of metal, and the same may happen in case of two charges of metal on a field of colour.

Armorial charges are usually divided into three classes: (1) Honourable ordinaries, figures of simple outline and geometrical form, conventional in character, which in some of the oldest coats are the only charge; (2) Subordinaries or subordinate ordinaries, which differ from the above chiefly in not being generally the recipients of charges, while honourable ordinaries may be and often are charged; (3) Common charges, representations of objects of all kinds, animals, plants, and the whole range of things natural and artificial.

Ordinaries.—The enumeration of the honourable ordinaries by different armorialists is not absolutely identical, some classing as subordinaries figures which others regard as belonging to this class. It may be predicated generally of the ordinaries that they may be borne either simply, along with other charges, charged with other figures, bounded by any of the forms of irregular partition-lines to be noticed below, or combined with each other. Also that they have in most cases their diminutives, which (except in the case of a canton as the diminutive of a quarter) cannot be charged. Taking as our test for admission to this more honourable class the capacity of receiving charges, they may be accounted thirteen in number:

The *Chief* (1, fig. IV.), lying horizontally along the upper part of the shield, and (as also the *Pale* and *Fess*) supposed to occupy a third of it. The *Pale* (2), a vertical band in the middle of a shield. It has a diminutive, the *Pallet*, seldom used singly, and a smaller diminutive, the *Endorse*. The *Fess* (3), a horizontal band in the middle of the shield. The *Bar* is a narrower fess, never used singly, and there are further diminutives, the *Closet* and *Barrulet*. The *Bend* (q.v.) (4), a band crossing the shield from dexter chief to sinister base; when charged it occupies one-third, and when plain one-fifth, of the field. It has for diminutives the

Bendlet, the *Cotise* or *Cost*, and the *Ribbon*. The ribbon is sometimes *couped* or cut short so as not to touch the edges of the shield. The cotise sometimes accompanies the bend in pairs on each side, when it is said to be *Cotised*, and the same term is sometimes applied with less propriety to a fess or chevron accompanied by a pair of its diminutives. The *Bend-sinister* (5), a band crossing the shield from sinister chief to dexter base. Its diminutive, the *Baton-sinister* (q.v.), *couped*, and borne over all is a mark of illegitimacy. The *Chevron* (6), a figure composed of two bands or limbs issuing from dexter and sinister base, and meeting about the honour point. Its diminutives are the *Chevronel*, which never appears singly, and the *Couple-close*, which sometimes accompanies the chevron in pairs, one on each side. The *Cross* (7), of the form of the Greek cross, with equal limbs.

Fig. IV.—Ordinaries and Subordinaries.

It has numerous varieties, most frequently borne in numbers or with other charges, for which see *Cross*. Any of them is said to be *fitchée* when its lower limb terminates in a sharp point. The *Saltire* (8), a St Andrew's Cross, or combination of the bends dexter and sinister, often borne along with a chief in the heraldry of Scotland. The *Pile* (9), a triangular wedge-shaped figure, issuing usually from the chief with point downwards. Three piles are often borne together. The *Pall* (10), the upper part of a saltire combined with the lower part of a pale. A variety of it, *couped* and pointed at the extremities, occurs in Scotland under the name of a *Shakefork*. The *Bordure* (11), a border surrounding the shield, sometimes used as a principal figure, sometimes as a difference. The *Orle* (12) and the *Tressure* (13) are sometimes classed as its diminu-

tives. The former is a narrower bordure detached from the edge of the shield. The latter, borne double and flowered and counterflowered with fleurs-de-lis, occurs in the royal shield of Scotland, and is a bearing greatly esteemed in Scottish heraldry. The *Quarter* is the upper dexter fourth part of the shield, cut off by a vertical and a horizontal line meeting in the fess point. The *Canton* (14), of more frequent occurrence, is a smaller figure like it, and also in dexter chief, unless otherwise specified. The half of a canton parted per bend is called a *Gyron*, chiefly known in British heraldry as giving its name to the field *Gyronny*. *Flanches* (15), borne in pairs, are projections from each flank of the shield bounded by a segment of a circle. Their diminutives are *Flasques* and *Voiders*.

Subordinaries.—The subordinaries (excluding those here included in the category of honourable ordinaries) are: The *Lozenge* (16), a rhombus with the acute angles at top and bottom. The *Masle* (17), a lozenge deprived of the middle part. The *Fusil* (18), an elongated lozenge. Several fusils are sometimes *conjoined en fess* (19), as in the coat of Percy. The *Billet* (20), an oblong figure placed perpendicularly. The *Roundle* (21), a circular disc or knob. Roundles have, in English heraldry, specific names in respect of their tinctures. A roundle or is called a *Bezant*; argent, a *Plate*; gules, a *Torteau*; sable, a *Pellet* or *Ogress*; vert, a *Pomme*. The *Annulet* (22), sometimes regarded by armorialists not as a ring but as a pierced roundle. The *Escutcheon* or *Inescutcheon* (23), a representation of a shield—the latter name being generally used when there is only one. It is difficult to see on what principle these last two charges are conventional enough to be ranked among the lesser ordinaries. The *Fret* (24), consisting of two narrow bendlets dexter and sinister in saltire, interlaced with a masle.

Parted Fields.—The field of an escutcheon (and sometimes an ordinary or other charge) may be of two or more different tinctures, divided by

Fig. V.—Parted Fields.

one or more partition-lines, and the consideration of partition-lines has here been postponed to this point, as the nomenclature of many of them is derived from that of the ordinaries and subordinaries. When divided by a partition-line in the direction of one of the ordinaries the shield is said to be '*parted* (or *party*) *per* that ordinary,' or simply '*per* that ordinary.' Thus we may have a shield parted *per pale* (1, fig. V.), *fess* (2), *bend*, *chevron*, or *saltire* (3). A shield divided in the direction of a cross is said to be quartered or parted

quarterly (4); parted both *per cross* and *per saltire* it is called *Gyronny of eight* (5), the well-known bearing of the Campbell family. A shield divided into any number of parts by lines in the direction of a pale, bend, bar, or chevron, is said to be *Paly*, *Bendy*, *Barry*, or *Chevronny*, the number of pieces being specified, as in the example (6), *paly of six* or *sable* (Athole). A field divided into square or oblong panes or pieces by vertical and horizontal lines is said to be *chequy*, as the ancient coat of Warren, *chequy* or *and azure panes* (7). A field divided into lozenge-shaped, masle-shaped, or fusil-shaped panes is described by the term *lozengy*, *mascally*, or *fusilly*. *Fusilly argent and gules* (8) is the coat of the Grimaldis, princes of Monaco.

A field strewn with an indefinite number of small charges so as to produce the effect of a pattern is said to be *semé* (sometimes aspersed or powdered) of that charge, as France ancient, *azure, semé of fleurs-de-lis* or (9). When bestrewn with an indefinite number of bezants, billets, cross crosslets, or drops, it is called *bezanty*, *billetty*, *crusilly*, or *goutté*. English heraldry attaching a specific term to drops of separate tinctures—i.e. *goutté d'eau* (water, tinctured argent), *de sang* (blood, gules, 10), *de larmes* (tears, azure), *de poix* (pitch, sable), &c. *Fretty* (11) is when a field is covered with a pattern of interlaced fillets placed diagonally, and leaving open spaces between them.

Partition-lines are not always straight. Fig. VI. represents the commonest forms of irregular partition-lines in use—viz. the *engrailed*, *invecked*, *wavy*, *nebulé*, *embattled*, *indented*, and *dancetté*, names equally applicable to the boundary-lines of ordinaries. An ordinary engrailed has the points of the engrailed line turned outwards, and an ordinary invecked inwards. When a fess or chevron is said to be embattled, it is only the boundary-line on the upper side that is of this form. Dancetté differs from indented by the partition-line having larger and fewer indentations.

Common Charges.—These are representations, more or less conventional, of familiar objects. The knights, in the early days of heraldry, ransacked the animal and vegetable kingdom and the whole range of objects, natural and artificial, for charges that would be distinctive; of which only a few of the most frequent, and those whose nomenclature or treatment is somewhat technical, can be here noticed.

Of beasts which occur in coat-armour, the most important, both in earlier and in later heraldry, is the *Lion*. Its earliest known occurrence is on the seal of Philip I., Duke of Flanders, in 1164; and before long the king of beasts was borne by a large number of the potentates of Europe. The lion is made to assume a variety of positions, a few of which are represented in fig. VII. Its original and normal attitude is *rampant* (1)—i.e. in an erect position with the left hind-leg resting on the ground, the head in profile, and the tail elevated over the back. *Rampant gardant* (2), the same with the head affrontée (looking out of the shield); *regardant* (3), the same looking backwards. *Passant* (4), walking, three paws resting on the ground, the dexter forepaw elevated, the head in profile looking forward, and tail elevated over the back; *passant gardant* (5), as the last, but with the head affrontée. A lion *saissant* (6) has both hind-legs on the ground, and the fore-legs elevated, as if to

spring; and a lion *sejant* (7) is rising to prepare for action. The lion *passant gardant* is often blazoned as the lion of England; and in times when terms of blazonry were comparatively few, it was known as the *leopard*; there has, in fact, been much controversy as to whether the animals in the escutcheon of England are lions or leopards. Two-headed, bi-corporate, and tri-corporate lions occur in heraldry, as also lion-dragons and lion-poissons. There is likewise the celebrated winged lion of St Mark adopted by the republic of Venice, and the two-tailed lion of Bohemia and of Simon de Montfort, Earl of Leicester. In British heraldry lions and other animals always face to dexter unless other-

wise blazoned. Two lions placed face to face are called *combatant*, and back to back, *addorsé*. Some of the above-mentioned names for the attitudes of the lion are applied to other heraldic animals. Lions and other beasts of prey are said to be *armed* or *langued* of any tincture, when their teeth and claws or their tongue are of that tincture, and in modern English blazon a lion is always presumed to be armed and langued gules unless either himself or the field be gules, in either of which cases he is armed and langued azure. A *demi-lion* (8) is the upper half of the body of a lion with the extremity of his tufted tail. Lions are often crowned, or gorged (collared) with a crown of some

Fig. VII.—Common Charges.

sort. Bears, bulls, boars, stags, goats, dogs, foxes, horses, and hedgehogs, and occasionally elephants, camels, moles, apes, bats, and mice occur as heraldic animals. A *stag* when in easy motion is said to be *trippant* (9); he is *at gaze* (10) when a lion would be *statant gardant*, and he is attired of any tincture when his attires—i.e. his antlers, are of that tincture. Animals that possess horns and hoofs are said to be armed and unguled in respect of them. The heads and limbs of animals are often borne as charges, and may be either *erased*, like the lion's head (11)—i.e. cut off with a jagged edge; or *couped* (12)—i.e. cut straight off. A *leopard's face* (13) shows none of the neck, and fronts the spectator. A *stag's head* borne full faced, with none of the neck seen, is said to be *cabossed* (14). *Boars' heads* (15) are not unfrequent, and *bears' heads* (16), which are usually represented muzzled. Animals

in heraldry sometimes assume a conventional form differing widely from the realistic type of the same creature—e.g. the antelope, which has a stag's head, a unicorn's tail, a tusk issuing from the tip of the nose, a row of tufts down the back of the neck, and similar tufts on the tail, chest, and thighs.

Among birds, far the most prominent is the *Eagle* (q.v.), most commonly represented in the conventional attitude known as *displayed* (17), with wings expanded. Being the king of birds, it became, next to the lion, the most favourite bearing of royal personages, and was adopted by the German emperors. The imperial eagle had at first but one head; the *two-headed eagle* (18) appeared in the middle of the 13th century, and occasionally occurs in English heraldry. The alleron and martlet, originally an eagle and a swallow respectively, became in time unreal birds, the one without claws or beak, the other without legs or beak. The falcon, the

pelican, the swan, the cock, the raven, the ostrich, the heron, and the parrot or papingoe are all armorial birds. The *pelican* is generally depicted pecking her breast, and when represented in her nest feeding her young with her blood, she is said to be *in her piety* (19). A peacock borne affrontée with his tail expanded is said to be *in his pride*. Birds having the power of flight are, in respect of their attitude, *close*, *rising*, or *volant*.

Fishes and reptiles occur as charges; the former are said to be *naïant*, if drawn in a horizontal, and *hauriant* (20), if drawn in a vertical position. The *dolphin*, whom naturalists do not acknowledge as a fish, is in heraldry the king of fish, and is very conventionally drawn most usually *embowed* (21)—i.e. with the body bent. It is best known in this attitude as the allusive bearing of the dauphin. The *escalloped shell* (22) is a favourite charge, having been the pilgrim's ensign in crusading times. *Serpents* occur in various attitudes, bowed, erect, &c., and in one famous instance (the coat of the Visconti) *vorant* (devouring) a ch d (23).

Of purely fantastic animals, we have the dragon, griffin, wyvern, cockatrice, unicorn, mermaid, and others.

Man in whole and in his parts also occurs in armory. *Argent*, a naked man proper, is the coat of the Scottish family of Dalzell, and we have *Moors*' (generally represented as blackamoors) heads, *Saracens*' heads, men's hearts, arms, legs, and hands, also that strange heraldic freak, the *three legs conjoined* (24), carried in the escutcheon of the Isle of Man.

To pass to the vegetable kingdom, trees, plants, leaves, and flowers are all usual heraldic charges. *Trees* are often *eradicated* (25), or torn up by the roots, sometimes placed on a *mount* (26), and occasionally *fructrated* of a different tincture. *Garbs* (27), representing sheaves of wheat, are well known as the arms of the Earls of Chester, of the Grosvenors, and of the Scottish family of Cumy. *Leaves*, as of the *laurel*, are often borne, like many other charges, in threes (28). A *trefoil*, with three leaflets and a stalk, is said to be *slipped* (29); in the *quatrefoil* and *cinquefoil* (30) the syllable foil means a petal. The *rose* (31) has obtained a prominence in English heraldry from having been the badge of the rival houses of York and Lancaster, and in the conventional representations of it, it has five petals, barbs between them to represent the calyx, and seeds in the centre. It is generally without a stalk, its tincture being either gules or argent, and it is usually barbed and seeded proper—i.e. the barbs are green, and stamina yellow or gold. But of the floral devices of heraldry the most famous is the *fleur-de-lis*, generally identified with the iris, adopted as a badge by Louis VII. of France in 1150, and borne by his son in the form of *semé* of *fleurs-de-lis* (9, fig. V.), which became the royal coat of France, till the flowers were reduced to three in number in the reign of Charles VI. (32).

Such charges as swords, scimitars, bows, arrows, helmets, battle-axes, horseshoes, mitres, crostiers, &c. explain themselves. The *sun* surrounded by rays is said to be in his splendour, and generally has a human face (33). A *crecent* (34), representing the moon, has both horns pointed upwards. If the horns are turned to dexter it is called an *increcent* (35); if to the sinister a *decrecent* (36). The *five-pointed star* (37), in the heraldry both of the Continent and of Scotland, represents the heavenly body so called, though not distinguishable from the *mullet* or *spur-rowel*, except that the latter is sometimes pierced. In modern English heraldry this figure is always styled a *mullet*, and the *estole* (38) or star has six or more wavy points. A *pheon* (39) is the head of a dart

barbed and engrailed on the inner side. A *battering-ram* (40) is furnished with an actual ram's head. A *water-budget* (41) represents the bags in which water was stored up and carried across the desert in crusading times. *Caltraps* (see *CALTROP*) or *chevaltraps* (42) are military instruments for galling the feet of horses. *Castles* (43) and *towers* (44) are not unfrequent, the former very generally triple-towered. An ancient one-masted galley, called a *lymphad* (45), is characteristic of the West Highlands of Scotland. Of charges derived from dress one of the most remarkable is the *maunch* (46), a 12th-century sleeve, borne by the Hastings family. *Cushions* (47) have become famous in Scotland from being borne by Bruce's gallant nephew, Randolph or Ranulph, Earl of Moray, and his descendants. The *clariion* (48) or war-trump is an early English bearing. The *chessrook* (49) or castle in chess is somewhat conventionally drawn. The *millrind* (50) is the iron affixed to the centre of the millstone.

Like medieval architecture, heraldry attained its greatest beauty and purity in the 13th century and first half of the 14th. From that date its early simplicity was gradually departed from: a variety of charges came to be accumulated in one shield, and there was a growing tendency to pictorialism. Trees are represented issuing out of a mount or little green hillock in base (26), and we have also animals walking on a base—i.e. a line cutting off the lower part of the shield. In Wales we have combinations such as a cradle with a child under a tree guarded by a goat, and sometimes in Spain and Italy two animals rampant against a tree, or such scenes as a bloodhound in the act of strangling a boar, or a *serpent vorant* a child (23). In the second half of the 18th century the heraldry of England entered on a singularly degraded and debased stage, far beyond the pictorialisms alluded to, shields being loaded with representations of sea-fights, fortresses, and landscapes, with medals and decorations granted to the bearer of them, setting all heraldic conventionalities at defiance, and dealing in details hardly discernible on the closest inspection. Such charges were habitually granted by way of chiefs of augmentation to the heroes of the old wars. It is to be hoped that the revival of a measure of taste in coat-armour has put an end to them for ever.

Blazonry.—To blazon a coat-of-arms is to describe it in words so precise as to enable any one who has an ordinary knowledge of heraldry to depict it correctly. The following are the principal rules of blazonry. The field must first be named; it may be of one tincture, or an arrangement of more than one (see *ante*—*Parted Fields*). The charges follow, beginning with those of most importance and nearest the field, their name, number, position, and tincture. An ordinary or a diminutive of an ordinary, except it be a chief, bordure, or canton, generally claims the precedence. When the principal charge is not in the centre of the shield, its position must be described, as *De Vere*, Earl of Oxford (fig. VIII. 1), quarterly gules and or, in the first quarter a star (mullet) argent. When two or three of the same charge occur, it is understood, unless otherwise specified, that two are placed in pale—i.e. one over the other; and three are disposed, two above and one below; and it is also understood that in case of a fess or a bend between six charges of the same kind, there are three in chief and three in base. In other cases the disposition of the charges must be specified, as *in bend*, *in cross*, *in saltire*, *in orle*; *three, two, and one*; *four, three, two, and one*, &c. If the ordinary, which is the principal charge, be itself charged, and there are also other charges in the field, the order of the words of blazon will be understood by

the following example—Wilmot, Earl of Rochester (2), argent, on a fess gules, between three eagles' heads erased sable, as many escallops or. An exception to the rule that an ordinary or its diminutive is first named, occurs where it debrouses or surmounts another charge—e.g. Abernethy (3), or, a lion rampant gules, surmounted by a ribbon

Fig. VIII.—Blazony.

sable. Generally speaking, a chief, bordure, or canton is mentioned last. When a bordure surrounds a chief, the bordure is named last of all, the reverse being the case when the chief covers the bordure. A bend may surmount a chief, in which case it is mentioned last.

Avoidance of repetition is one of the principles of blazony. When any tincture has to be repeated, it is on the second occasion described as *of the first*, *of the second*, *of the last*, or *of the field*—e.g. Graham (4), or, on a chief sable, three escallops of the field. Repetition may also be avoided by naming the tincture only the second time—e.g. Mar (5), azure, a bend between six crosslets fitchée or, where the tincture *or* applies to both bend and crosslets.

When the field is of a metal and colour separated by any of the lines of partition, and the charge on it is said to be *counterchanged*, this means that the part of the charge which is on the metal is of the colour, and *vice versa*, as in the coat borne by the poet Chaucer (6), per pale, argent and gules, a bend counterchanged.

Differencing.—With the advance of the science of arms it became necessary not only to distinguish different families, but to distinguish the different members and branches of a family from each other and from their chief. The head of the house had alone the right to use the pure paternal coat; the cadets had to wear it with a *brisure* or *difference*. There is great variety in the early brisures. A change of tincture, the substitution of one ordinary for another, the debrouising of the paternal coat by a bend, the surrounding the arms with a bordure, uncharged or charged, and the addition of part of the coat of an heiress, were all in use as modes of differencing. The differenced coat became an independent heraldic composition, sufficiently like the original arms to indicate the family to which its owner belonged, and also often suggestive of events in the history of the cadet line.

The name of *marks of cadency* has been given to certain small figures which, by a conventional arrangement, indicate the order of descent of the different sons of a family. As systematised about the reign of Henry VII., and in use in modern English heraldry, the marks of cadency are, the *label* (1, fig. IX.) for the eldest son, the *crescent* (2) for the second, the *mullet* (3) for the

third, the *martlet* (4) for the fourth, the *annulet* (5) for the fifth, the *fleur-de-lis* (6) for the sixth, the *rose* for the seventh, the *cross moline* for the eighth, and the *octofoil* for the ninth. The difficulties are obvious of carrying out a system of this kind through all the ramifications of a family for successive generations, even by such devices as charging a crescent with a mullet for the third son of a second son, &c., and the consequence of the supersession in England of all other differences by these figures has been that differencing is much neglected, and remote cadets are often found bearing the arms of the head of their house undifferenced. With the sons and daughters of the royal house of the United Kingdom another usage prevails. They all bear their arms differenced by a label of three points argent. That of the Prince of Wales is plain, those of the younger princes are variously charged.

Fig. IX.—Marks of Cadency.

The label of the Duke of Edinburgh was charged with a St George's cross in the centre point, and in each of the other points with an anchor azure. The Duke of Connaught substitutes for the anchor a fleur-de-lis azure, and the Duke of Cambridge had two hearts in pale gules.

In Scotland, owing perhaps to the wider ramifications of the principal feudal families, differencing has been considered of more moment, and is the subject of a separate treatise by the Scottish herald Nisbet. The modern marks of cadency are less in use. The modification of the paternal coat by an additional charge, the engrailing, invecking, &c., of a chief or a partition-line has never fallen out of use. Differencing by a bordure has also been much in favour, a plain bordure of the tincture of the principal charge in the case of a second son, which may be engrailed, invecked, wavy, &c., for cadets branching off in the same generation, and for sub-cadets, parted in different ways, or charged with figures from the maternal coat. With cadets of a later generation the bordures will be of a different colour. Some such system, more or less rigidly observed, runs through the differencing of Scottish coats, which is under the direct supervision of the Lyon Office. For difference designed to illegitimate children, see BATON-SINISTER.

Marshalling of Arms.—Marshalling is the proper arrangement of such coats as are to be combined in one shield. In the earlier heraldry it was not the practice to exhibit more coats than one on a shield, but the arms of husband and wife were sometimes placed *accollée*, or side by side in separate escutcheons; or the principal shield was surrounded by smaller ones, containing the arms of maternal ancestors; and we not unfrequently find maternal descent or marriage indicated by the addition of some bearing from the wife's or mother's shield. Then followed *dimidiation*, when the shield was parted per pale, and the two coats placed side by side, half of each being shown. By the more modern practice of *impaling* (1, fig. X.), the whole of each coat is exhibited, a reminiscence, however, of the older practice being retained in the omission of bordures, and occasionally tressures, on the side bounded by the line of impalement. The most common case of impalement in English heraldry is where the coats of husband and wife are conjoined, the husband's arms occupying the dexter side of the shield, or place of honour, and the wife's the sinister side, the impaled coat being personal, and non-descending to the children.

The arms of states are sometimes impaled, as were those of England and Scotland in the first and fourth quarters of the achievement of Great Britain from the accession of Queen Anne to the Irish Union. Bishops, deans, heads of colleges, and kings-of-arms impale their arms of office with their family coat, giving the dexter side to the

Fig. X.—Marshalling of Arms.

former. This practice in Scotland, as far as bishops are concerned, belongs only to the post-Restoration episcopacy, as the Scottish sees had no arms till then.

The husband of an heiress (in the heraldic sense) is entitled, according to the more modern usage of British heraldry, to place her arms on a small shield, called an *escutcheon of pretence*, in the centre of his shield, instead of impaling, and in the next generation the arms of the heiress are transferred to one of the quarters of the shield. The *escutcheon of pretence* is, however, not to be confounded with a small shield of the same kind, called an *escutcheon en surtout* (3), much in use in German, French, and Scottish heraldry, which takes a permanent place in the achievement, and may contain either the paternal arms (as in the Tweeddale branch of the Hay family), some feudal coat, or the coat of an heiress in some past generation, whose memory it has been thought desirable to preserve. It has been the practice for an elected king to place his arms in an *escutcheon en surtout*, the old German emperors placing their family arms on the breast of the imperial eagle.

Quartering, or the exhibiting of different coats on a shield divided both horizontally and vertically, originated in the 13th century, but was little practised till the 14th. The divisions of the shield are called quarters, and are numbered horizontally, beginning at the dexter chief (2). Arms are quartered on various accounts: (a) To indicate dominion. A sovereign quarters the ensigns of his different states. On the tomb in Westminster Abbey of Eleanor, daughter of Ferdinand III., king of Castile and Leon, and first wife of Edward I., is the paternal shield of that princess, in which the castle of Castile occupied the first and fourth quarter, and the lion of Leon the second and third. The received rule regarding the quartering of the ensigns of different states is that precedence is given to the most ancient, unless it be of inferior importance. The kings of England, owing to their supposed claim to the French throne, long bore France in the first and fourth quarter, and England in the second and third. In the arms of the United Kingdom, as now borne, England occupies the first and fourth quarter, Scotland the second, and Ireland the third—the relative positions, however, of England and Scotland being reversed on the official seals of Scotland. Feudal arms are sometimes quartered by subjects. Some of the peers of Scotland bear arms of this description. (b) Arms of augmentation or special concession accorded to a subject by his sovereign by way of honour, are sometimes granted to be borne quarterly with the paternal coat. These sometimes include a portion of the royal insignia, and have precedence of the paternal coat. (c) The most usual reason for quartering is to indicate

descent from an heiress who has married into the family. Where there is but one heiress, her coat occupies the second and third quarters of the shield, and the paternal arms the first and fourth. When there are more than one, they are marshalled in the successive quarters in the order of the inter-marriages. Where more than four coats have to be marshalled, the number of vertical lines is increased, and the divisions, though more than four, are still called quarters (5). Where there is an odd number of coats, the last quarter is usually filled up by repeating the first. One of the quarters may itself be quartered, when the heiress was entitled to bear a quartered coat: the shield is then said to be *counterquartered* (4), and its primary quarters are called *grand quarters*. In the course of generations a shield may thus sometimes be inconveniently crowded by the accumulation of coats, including the coats to which each heiress may, in a similar way, have become entitled; and in Germany sometimes above twenty coats (generally coats of dominion) are found marshalled in one escutcheon; but, in British heraldry, families entitled to a number of quarterings usually select some of the most important. A quartered coat may be surrounded by a *bordure* (for difference), in which case it is treated as one coat.

In the heraldry of the Highlands of Scotland, which is not older than the 16th century, a system of quartering prevailed quite irrespective of family alliance, the quarters being changed under different modifications, with figures partly borrowed from the old monumental sculpture of the country, including the eagle, the fish, the hand with the red cross, and the one-masted galley of Lorne.

The expression 'quarterings' is sometimes loosely used for descents in cases where there is no right to quarter from representation. The eight or sixteen quarterings which in former days were on the Continent essential for the holder of nearly every public office, which were, till lately, often found ranged round the Scottish funeral *escutcheon*, and which were lately important for many purposes in Germany and Austria, have no reference to representation, but imply purity of blood for four or five generations—i.e. that the father and mother, the two grandmothers, the four great-grandmothers, and also, in the case of sixteen quarterings, the eight great-great-grandmothers, have all been entitled to coat-armour.

Other modes of marshalling are in use on the Continent, as the division of a shield per saltire, or into three parts. The marshalling of a coat *en pointe*, or on a triangular figure issuing from the base of the shield, used to be familiar from the *escutcheon* of Hanover, borne first in the fourth quarter of our royal achievement, and afterwards *en surtout*, where we have Brunswick impaled with Lüneburg, Saxony in base, and over all the crown of Charlemagne, as belonging to the office of arch-treasurer of the empire.

External Ornaments.—Over and above the shield of arms there are certain accessories in use to be represented along with it, and which together with it constitute an *achievement of arms*. These include the helmet, the crest, the motto, the mantling, the supporters, and the crown or coronet.

Before the beginning of the 14th century a helmet began to be placed above shields of arms, the shield being represented in the position called *couchée*—i.e. suspended from the sinister chief angle. After the *couchée* attitude was abandoned, the helmet resting on the shield began to vary according to the rank of the bearer, the forms adopted being both unbecoming and fanciful. The following are the forms in use in

modern British heraldry: (1) that assigned to the sovereign and royal family, which is full faced, of gold, lined with crimson, and with the visor divided by six projecting bars; (2) the helmet of peers, exhibited in profile, with five bars, of which three or four are shown. The helmets of dukes and

Fig. XI.—Helmets.

marquises are entirely of gold, those of earls, viscounts, and barons of steel, with the bars of gold; (3) the helmet of baronets and knights, of steel, full faced, with the visor thrown back, and without bars; (4) the helmet of esquires and gentlemen, in profile, of steel, and with the visor closed. A helmet is never placed over the arms of any woman except the sovereign.

The *Crest* is an ornament of the head rising above the helmet. Crests first appear occasionally on seals and monuments of the 13th century, the earliest being a radiant ornament somewhat like a displayed fan. Originally a special mark of honour worn by heroes of great valour or holding a high military command, the crest became eventually, in English heraldry at least, an inseparable adjunct of the coat-of-arms. An extraordinary number of crests are sometimes accumulated in German achievements, each on its separate helmet. In our modern heraldry the crest is generally placed on a wreath of two pieces of silk of the livery colours—i.e. the first metal and first colour of the shield, but occasionally on a cap of maintenance or a ducal coronet. In the achievement of the sovereign the helmet is placed immediately above the shield, the crown rests on the helmet, and the royal crest rises from the crown. In the achievements of peers, on the other hand, the helmet rises from the coronet, which is placed immediately over the shield.

The *motto* is placed within an escrol either over the crest or below the shield. It bears in many cases an allusion to the family name or arms, or to the crest.

The *mantling* or *lambrequin* is an appendage hanging down from the helmet and passing behind the escutcheon. It is considered to be derived either from the *contoise*, an ornamental scarf represented in seals and monuments of the 13th and 14th centuries, or from the military mantle or robe of estate. Its comparatively irregular shape in more modern instances has been explained as indicative of the tattered condition to which it has been reduced in the field of battle. Tassels are sometimes appended, and when treated as a robe of estate the bearings of the shield are occasionally repeated on it. In British heraldry the mantling of the sovereign is of gold, lined with ermine; that of peers of crimson velvet, lined with ermine. Knights and gentlemen have either the livery colours of the shield, or, as the practice is in Scotland, crimson velvet lined with silver.

The *Crown* (q.v.), *Coronet* (q.v.), and *Mitre* (q.v.) are adjuncts to the shields of those whose dignity or office entitles them to be thus distinguished.

Supporters.—These figures placed on each side of an armorial shield, as it were to support it, were at first purely decorative, generally, however, having allusion to the arms or descent of the bearer; but they soon came to be considered indicative of his being the head of a family of eminence or distinction. The most usual supporters are animals,

real or fabulous; but men in armour are not unfrequent, as also naked men or savages, often carrying clubs, and wreathed about the head and middle. On early seals a single supporter occasionally occurs, and there are instances of the escutcheon being placed on the breast of an eagle displayed. The dexter and sinister supporters are often, and almost always in continental heraldry, alike. In British heraldry, however, the two supporters are in many cases different; and where the bearer represents two families, a supporter is sometimes adopted from the achievement of each. The rules restricting the right to supporters are different in different countries. In England their use is confined to the royal family, peers, knights of the Garter, and knights Grand Cross of the Bath (with the last the right does not transmit to descendants), the heads of a very few families out of the peerage, who derive their right from an old patent or early usage, and the chief mercantile companies of London. In Scotland the right extends to the chiefs of important clans, and the representatives of minor barons who had full baronial rights prior to 1587, the date of the act which finally excluded the minor barons from parliament. Baronets of Nova Scotia have as such no right to supporters, though many of them bear them in respect of their baronial qualifications. It is considered to be in the power of the Scottish King-of-arms to confer them *ex gratia*, a right which has been sparingly exercised, except for the period between 1790 and 1820.

Any collar and badge of an order to which the bearer may have a right forms properly a part of his achievement, the collar surrounding his shield, and the badge being suspended from it. The badge of Nova Scotia is suspended by an orange-tawny ribbon from the shield of baronets of Scotland; and other baronets have the arms of Ulster in a canton or an inescutcheon (see *BARONET*). Certain officers of state accompany their shields with marks of their rank. The Duke of Norfolk as Earl Marshal places saltirewise, behind his shield two truncheons, tipped above with the arms of England and below with his own arms. The Lord Justice-general of Scotland in like manner places two swords saltirewise behind his shield.

The full achievement of the sovereign of the United Kingdom of Great Britain and Ireland is shown in fig. XII. Its full blazon is: Quarterly,

former. This practice in Scotland, as far as bishops are concerned, belongs only to the post-Restoration episcopacy, as the Scottish sees had no arms till then.

The husband of an heiress (in the heraldic sense) is entitled, according to the more modern usage of British heraldry, to place her arms on a small shield, called an *escutcheon of pretence*, in the centre of his shield, instead of impaling, and in the next generation the arms of the heiress are transferred to one of the quarters of the shield. The *escutcheon of pretence* is, however, not to be confounded with a small shield of the same kind, called an *escutcheon en surtout* (3), much in use in German, French, and Scottish heraldry, which takes a permanent place in the achievement, and may contain either the paternal arms (as in the Tweeddale branch of the Hay family), some feudal coat, or the coat of an heiress in some past generation, whose memory it has been thought desirable to preserve. It has been the practice for an elected king to place his arms in an *escutcheon en surtout*, the old German emperors placing their family arms on the breast of the imperial eagle.

Quartering, or the exhibiting of different coats on a shield divided both horizontally and vertically, originated in the 13th century, but was little practised till the 14th. The divisions of the shield are called quarters, and are numbered horizontally, beginning at the dexter chief (2). Arms are quartered on various accounts: (a) To indicate dominion. A sovereign quarters the ensigns of his different states. On the tomb in Westminster Abbey of Eleanor, daughter of Ferdinand III., king of Castile and Leon, and first wife of Edward I., is the paternal shield of that princess, in which the castle of Castile occupied the first and fourth quarter, and the lion of Leon the second and third. The received rule regarding the quartering of the ensigns of different states is that precedence is given to the most ancient, unless it be of inferior importance. The kings of England, owing to their supposed claim to the French throne, long bore France in the first and fourth quarter, and England in the second and third. In the arms of the United Kingdom, as now borne, England occupies the first and fourth quarter, Scotland the second, and Ireland the third—the relative positions, however, of England and Scotland being reversed on the official seals of Scotland. Feudal arms are sometimes quartered by subjects. Some of the peers of Scotland bear arms of this description. (b) Arms of augmentation or special concession accorded to a subject by his sovereign by way of honour, are sometimes granted to be borne quarterly with the paternal coat. These sometimes include a portion of the royal insignia, and have precedence of the paternal coat. (c) The most usual reason for quartering is to indicate

descent from an heiress who has married into the family. Where there is but one heiress, her coat occupies the second and third quarters of the shield, and the paternal arms the first and fourth. When there are more than one, they are marshalled in the successive quarters in the order of the intermarriages. Where more than four coats have to be marshalled, the number of vertical lines is increased, and the divisions, though more than four, are still called quarters (5). Where there is an odd number of coats, the last quarter is usually filled up by repeating the first. One of the quarters may itself be quartered, when the heiress was entitled to bear a quartered coat: the shield is then said to be *counterquartered* (4), and its primary quarters are called *grand quarters*. In the course of generations a shield may thus sometimes be inconveniently crowded by the accumulation of coats, including the coats to which each heiress may, in a similar way, have become entitled; and in Germany sometimes above twenty coats (generally coats of dominion) are found marshalled in one escutcheon; but, in British heraldry, families entitled to a number of quarterings usually select some of the most important. A quartered coat may be surrounded by a *bordure* (for difference), in which case it is treated as one coat.

In the heraldry of the Highlands of Scotland, which is not older than the 16th century, a system of quartering prevailed quite irrespective of family alliance, the quarters being changed under different modifications, with figures partly borrowed from the old monumental sculpture of the country, including the eagle, the fish, the hand with the red cross, and the one-masted galley of Lorne.

The expression 'quarterings' is sometimes loosely used for descents in cases where there is no right to quarter from representation. The eight or sixteen quarterings which in former days were on the Continent essential for the holder of nearly every public office, which were, till lately, often found ranged round the Scottish funeral *escutcheon*, and which were lately important for many purposes in Germany and Austria, have no reference to representation, but imply purity of blood for four or five generations—i.e. that the father and mother, the two grandmothers, the four great-grandmothers, and also, in the case of sixteen quarterings, the eight great-great-grandmothers, have all been entitled to coat-armour.

Other modes of marshalling are in use on the Continent, as the division of a shield per saltire, or into three parts. The marshalling of a coat *en pointe*, or on a triangular figure issuing from the base of the shield, used to be familiar from the *escutcheon* of Hanover, borne first in the fourth quarter of our royal achievement, and afterwards *en surtout*, where we have Brunswick impaled with Lineburg, Saxony in base, and over all the crown of Charlemagne, as belonging to the office of arch-treasurer of the empire.

External Ornaments.—Over and above the shield of arms there are certain accessories in use to be represented along with it, and which together with it constitute an *achievement of arms*. These include the helmet, the crest, the motto, the mantling, the supporters, and the crown or coronet.

Before the beginning of the 14th century a helmet began to be placed above shields of arms, the shield being represented in the position called *couchée*—i.e. suspended from the sinister chief angle. After the *couchée* attitude was abandoned, the helmet resting on the shield began to vary according to the rank of the bearer, the forms adopted being both unbecoming and fanciful. The following are the forms in use in

modern British heraldry: (1) that assigned to the sovereign and royal family, which is full faced, of gold, lined with crimson, and with the visor divided by six projecting bars; (2) the helmet of peers, exhibited in profile, with five bars, of which three or four are shown. The helmets of dukes and

1. Sovereign. 2. Peer. 3. Knight. 4. Esquire.

Fig. XI.—Helmets.

marquises are entirely of gold, those of earls, viscounts, and barons of steel, with the bars of gold; (3) the helmet of baronets and knights, of steel, full faced, with the visor thrown back, and without bars; (4) the helmet of esquires and gentlemen, in profile, of steel, and with the visor closed. A helmet is never placed over the arms of any woman except the sovereign.

The *Crest* is an ornament of the head rising above the helmet. Crests first appear occasionally on seals and monuments of the 13th century, the earliest being a radiant ornament somewhat like a displayed fan. Originally a special mark of honour worn by heroes of great valour or holding a high military command, the crest became eventually, in English heraldry at least, an inseparable adjunct of the coat-of-arms. An extraordinary number of crests are sometimes accumulated in German achievements, each on its separate helmet. In our modern heraldry the crest is generally placed on a wreath of two pieces of silk of the livery colours—i.e. the first metal and first colour of the shield, but occasionally on a cap of maintenance or a ducal coronet. In the achievement of the sovereign the helmet is placed immediately above the shield, the crown rests on the helmet, and the royal crest rises from the crown. In the achievements of peers, on the other hand, the helmet rises from the coronet, which is placed immediately over the shield.

The *motto* is placed within an escrol either over the crest or below the shield. It bears in many cases an allusion to the family name or arms, or to the crest.

The *mantling* or *lambrequin* is an appendage hanging down from the helmet and passing behind the escutcheon. It is considered to be derived either from the contoise, an ornamental scarf represented in seals and monuments of the 13th and 14th centuries, or from the military mantle or robe of estate. Its comparatively irregular shape in more modern instances has been explained as indicative of the tattered condition to which it has been reduced in the field of battle. Tassels are sometimes appended, and when treated as a robe of estate the bearings of the shield are occasionally repeated on it. In British heraldry the mantling of the sovereign is of gold, lined with ermine; that of peers of crimson velvet, lined with ermine. Knights and gentlemen have either the livery colours of the shield, or, as the practice is in Scotland, crimson velvet lined with silver.

The *Crown* (q.v.), *Coronet* (q.v.), and *Mitre* (q.v.) are adjuncts to the shields of those whose dignity or office entitles them to be thus distinguished.

Supporters.—These figures placed on each side of an armorial shield, as it were to support it, were at first purely decorative, generally, however, having allusion to the arms or descent of the bearer; but they soon came to be considered indicative of his being the head of a family of eminence or distinction. The most usual supporters are animals,

real or fabulous; but men in armour are not unfrequent, as also naked men or savages, often carrying clubs, and wreathed about the head and middle. On early seals a single supporter occasionally occurs, and there are instances of the escutcheon being placed on the breast of an eagle displayed. The dexter and sinister supporters are often, and almost always in continental heraldry, alike. In British heraldry, however, the two supporters are in many cases different; and where the bearer represents two families, a supporter is sometimes adopted from the achievement of each. The rules restricting the right to supporters are different in different countries. In England their use is confined to the royal family, peers, knights of the Garter, and knights Grand Cross of the Bath (with the last the right does not transmit to descendants), the heads of a very few families out of the peerage, who derive their right from an old patent or early usage, and the chief mercantile companies of London. In Scotland the right extends to the chiefs of important clans, and the representatives of minor barons who had full baronial rights prior to 1587, the date of the act which finally excluded the minor barons from parliament. Baronets of Nova Scotia have as such no right to supporters, though many of them bear them in respect of their baronial qualifications. It is considered to be in the power of the Scottish King-of-arms to confer them *ex gratia*, a right which has been sparingly exercised, except for the period between 1790 and 1820.

Any collar and badge of an order to which the bearer may have a right forms properly a part of his achievement, the collar surrounding his shield, and the badge being suspended from it. The badge of Nova Scotia is suspended by an orange-tawny ribbon from the shield of baronets of Scotland; and other baronets have the arms of Ulster in a canton or an inescutcheon (see *BARONET*). Certain officers of state accompany their shields with marks of their rank. The Duke of Norfolk as Earl Marshal places saltirewise, behind his shield two truncheons, tipped above with the arms of England and below with his own arms. The Lord Justice-general of Scotland in like manner places two swords saltirewise behind his shield.

The full achievement of the sovereign of the United Kingdom of Great Britain and Ireland is shown in fig. XII. Its full blazon is: Quarterly,

Fig. XII.—Royal Arms of the United Kingdom.

first and fourth gules, three lions passant gardant in pale, or, for England; second, or, a lion rampant within a double tressure flory-counterflory gules,

for Scotland; third, azure, a harp or, stringed argent, for Ireland; all surrounded by the Garter. *Crest*.—Upon the royal helmet, the imperial crown proper, thereon a lion statant gardant or, imperially crowned proper. *Supporters*.—Dexter, a lion rampant gardant or, crowned as the crest. Sinister, a unicorn argent, armed, crined, and unguled proper, gorged with a coronet composed of crosses patée and fleurs-de-lis, a chain affixed thereto passing between the fore-legs, and reflexed over the back, also or. *Motto*.—‘*Dieu et mon Droit*,’ in the compartment below the shield, with the Union rose, shamrock, and thistle engrafted on the same stem.

This article may appropriately conclude with a short account of the various ways in which the royal arms of England, Great Britain, and the United Kingdom have been borne. The Great Seal of Richard Cœur-de-Lion, made after his return from the third crusade, had the three lions passant gardant (or leopards) in pale, as they have ever since been depicted. In 1340 Edward III., in virtue of the supposed right of his mother, assumed the title of king of France, and quartered the arms of France (azure, semé of fleurs-de-lis or) with those of England, giving the precedence to the former. Richard II. sometimes bore the reputed arms of Edward the Confessor (azure, a cross flory between five martlets or) impaled with his quartered coat, giving the former the precedence. In conformity with the practice in France, the fleurs-de-lis were in the later part of the reign of Henry IV. reduced to three in number. No further change took place in the royal escutcheon until the time of James I., except that Mary, on her second Great Seal, made after her marriage with Philip II., impaled the arms of Spain and England.

James VI. of Scotland, on succeeding to the throne of England as James I., quartered the arms borne by preceding sovereigns with those of Scotland and Ireland, the first and fourth quarters being counterquartered France and England, the second quarter being the lion rampant of Scotland; the third, the harp of Ireland. The royal arms were borne similarly by all the sovereigns of the House of Stuart until the reign of Anne, except that William III. bore *en surtout* the coat of Nassau: azure, semé of billets, a lion rampant or. In the reign of Anne the legislative union with Scotland brought about a further change; England impaled with Scotland was placed in the first and fourth quarter, France in the second, and Ireland in the third. The accession of George I. displaced England and Scotland from the fourth quarter, to make way for the arms of Hanover (see *ante*—*Quartering*). In 1801 George III. laid aside the titular assumption of king of France, and abandoned the French fleurs-de-lis. The arms of England were now made to occupy the first and fourth quarter, Scotland the second, and Ireland the third, while the arms of Hanover were placed *en surtout*. These last were finally abandoned on the severance of Hanover at the accession of Queen Victoria, when the royal escutcheon assumed its present arrangement.

The lion passant (or statant) gardant as the *crest* of England first appears on the Great Seal of Edward III. The supporters borne in former times by the kings of England varied much, particularly during the early period when these appendages of the shield were invested with more of a decorative than an armorial character, and perhaps often left to the fancy of the engraver. When the arms of any of the English sovereigns from Richard II. to Edward IV. are represented with supporters, the animals chosen are almost indifferently lions, antelopes, or white harts, and occasionally their place is supplied by angels. Edward IV.’s shield is sometimes supported on one side by a black bull,

and that of Richard III. in once instance by white boars. During the reigns of Henry VII., Henry VIII., Edward VI., Mary, and Elizabeth, the lion, red dragon, and greyhound were the animals most in vogue; the herald or engraver generally choosing as it suited him two out of the three. James I. for the first time clearly defined the royal supporters, adopting the lion of England and unicorn of Scotland as they have ever since been borne.

At the union of 1603 a different mode of marshalling from what has been described was allowed in Scotland, the arms of that kingdom occupying the first and fourth quarter, and England being relegated to the second. The Act of Union of 1707 contains no provision for the continuance of a special mode of marshalling for Scotland; but the various official seals of Scotland have uniformly reversed the places of England and Scotland, giving precedence to the latter. The royal arms, as borne in Scotland, were till 1907 in use to be encircled with the collar of the Thistle outside the Garter. The Scottish crest took the place of the English, and the unicorn supporter took precedence of the lion, the former being crowned and gorged with an antique crown.

The full blazon of the old royal arms of Scotland is as follows: Or, a lion rampant gules, armed and langued azure, within a double tressure flory-counterflory of fleurs-de-lis of the second. *Supporters*.—Two unicorns argent, imperially crowned, armed, crined, and unguled or, gorged with open crowns, with chains affixed thereto, and reflexed over the back, of the last. *Crest*.—Upon the imperial crown proper, a lion sejant affrontée gules, crowned or, holding in the dexter paw a sword, and in the sinister a sceptre, both proper. *Mottos*.—‘*Nemo me impune lacessit*,’ and, over the crest, ‘*In Defence*.’

Among standard works on heraldry are Guillim’s *Display of Heraldry* (editions of 1610 and 1724); Edmonson’s *Complete Body of Heraldry* (1780); Sir George Mackenzie’s *Science of Heraldry treated as part of the Civil Law and Law of Nations* (1680); Nisbet’s *System of Heraldry* (1722-43; reprinted 1810); De la Colombière’s *Science Héroïque* (1669); various French treatises of Ménestrier (1671-80); Spener’s *Opus Heraldicum* (1690); and the *Nürnbergger Wappenbuch*. Among modern treatises: Planché’s *Pursuivant of Arms*; Montagu’s *Heraldry*; Boutell’s *Heraldry, Historical and Practical* (1864); Seton’s *Heraldry in Scotland* (1863); Burke’s *General Armory*; Bouton’s *Traité de Blason* (1863); Rielstap’s *Armorial Général* (Gouda, 1884); *L’Art Héraldique*, by Gourdon de Genouillac (1889); F. E. Hulme’s *Heraldry* (1891); and *A Treatise on Heraldry, British and Foreign*, by the Rev. J. Woodward and Dr G. Burnett (2 vols. 1892).

Herat, capital of the most westerly of the three divisions of Afghanistan, stands on the Hari-Rud, at the height of 2500 feet above the sea, in 34° 50' N. lat., 62° 30' E. long.; distance from Kabul, 390 miles west. Situated near the boundaries at once of Afghanistan, Persia, and the Transcasian district of Western Turkestan, Herat is one of the principal marts of Central Asia, carrying on at the same time extensive manufactures of its own in wool and leather. The vicinity, naturally fertile, has been artificially rendered much more so by means of irrigation, drawn from the Hari-Rud and its tributaries. Owing to this abundance in water, Herat and its district has been at all times famous for its rich crops and excellent fruits, in fact it has been the granary of the north-western portion of Afghanistan and of the adjoining Turkoman country. But the city claims notice mainly on political and military grounds. Long the royal seat of the descendants of Timur, and often a bone of contention between the warlike tribes all round, it is fortified by a ditch and wall, and is commanded on its north side by a strong citadel built under the

direction of British officers, amongst whom Sir Eldred Pottinger occupied a pre-eminent place. In 1885-86 the fortifications of Herat were examined and armed by the military members of the Afghan Boundary Commission. In modern times the place has acquired a kind of European importance, being, towards Persia and Russia, the key of Afghanistan, which country in turn affords the only approach by land to western India. In this connection Herat has been viewed as an outpost of England's eastern empire against Russian intrigue and encroachment. Hence it has been alike the subject of treaties and the occasion of wars between Great Britain, as the mistress of India, and Persia, as virtually a vassal of Russia. This feature of the history of the city was more specially developed in connection with the last conflict between Persia and England. In November 1856 the Shah, regarded by the British government as a vassal and agent of the Czar, captured Herat, while actually conducting negotiations for an amicable adjustment at Constantinople; but he was within a few months constrained to relinquish his prey and renounce his claims by a British expedition directed against the opposite extremity of his empire. Since Russia, after subduing the Tekke Turkomans and after having annexed the oasis of Merv (1884), pushed her frontiers as far as Chihil Dukhteran and Kushk, which is from 30 to 40 miles distant from the gates of Herat, the political importance of the place has grown immensely, and, especially since the Caspian railway was connected by a branch with Kushk, Herat is actually the pivot of the whole Central Asian question. The Anglo-Russian agreement of 1907, recognising three 'spheres' in Persia—one Russian in the north, a British one in the south, and a neutral one in the middle—was so arranged that the whole of the Afghan frontier opposite Herat should fall within the neutral zone or sphere. From a commercial point of view, Herat has been at all times an emporium for the trade between Central Asia, Persia, and India, as the caravan roads leading from the Oxus and from the Indus towards Persia and Western Asia found here their point of junction. Indigo, dried fruits, rose-water, dyes, asafoetida, rice, wool, carpets, raw hides, silk, and leather wares are the chief items of export, whilst chintzes, cloth, sugar, ironwares, and European arms are imported from Russia and the West. The town, famous in the time of Sultan Husein Baikara for its splendid buildings, is to-day a heap of ruins, out of which the citadel, the Charsu, the Tuma Musjid, and parts of the Musallah are prominent as remnants of a bygone glory. The population, consisting chiefly of Persians, Tajiks, and Chihar Aimaks—Afghans constitute only the garrison—has fluctuated from 100,000 to 10,000, and is now about 20,000.

See *AFGHANISTAN*; Malletson's *Herat* (1880); Yate's *Northern Afghanistan* (1888); Holdich's *Indian Borderland* (1891).

Hérault, a maritime department in the south of France, bounded on the south-east by the Gulf of Lions, is oval in form, 84 miles in greatest length from east to west, and has an area of 2393 sq. m. Pop. (1872) 429,878; (1921) 488,215. It is occupied in the north and north-west by chains of the Cévennes; but the mountainous tracts give place to low plains as the coast is approached, and these in turn to salt-marshes and lagoons next the sea. The largest of the lagoons (*étangs*), Thau, covers nearly 20,000 acres. The principal rivers are the Hérault, the Orb, and the Lez, which rise in the Cévennes and pursue a generally southward course to the Mediterranean. The climate is unusually fine, though in summer very hot and dry. About a fourth of the area is arable. Previous to

the devastating attacks of the phylloxera, Hérault was counted amongst the most important of the wine-growing districts of France. The acreage planted with vines and the yield of wine in ten years decreased to about one-third. The department has since recovered. The cultivation of olives and the breeding of silkworms and sheep are important industries, as are also the preparation of brandy and liqueurs, the manufacture of cloth, paper, oils, chemical products and salt, and fisheries. Coal is mined; salt is prepared from the saline marshes; and immense quantities of fish are obtained. The arrondissements are Béziers, Lodève, Montpellier, and Saint-Pons; capital, Montpellier.

Herbal, originally a book containing an account of all known plants with their medicinal properties, is now a book containing descriptions only of those plants which possess medicinal properties. Among old herbals are *The Grete Herbal* (1516), those of Turner (1551), Dodoens (tr. from French, 1578), and Gerard (1597), and Parkinson's *Theatrum Botanicum* (1640). See *PLANTS*, Mrs Arber's *Herbals, their Origin and Evolution* (1912), and a learned article by Singer in the *Edinburgh Review*, January 1923.

Herbarium, or *HORTUS SICCUS* ('dry garden'), a collection of specimens of dried plants, intended for the future study and examination of botanists. Specimens intended for the herbarium should be as perfect in all their parts as possible. They are laid between layers of blotting or botanical paper, and subjected to pressure to dry them. The pressure should be light at first, but increased as the process of drying goes on. The paper requires to be changed frequently—daily in the case of succulent specimens. Special methods have to be adopted in the case of very succulent specimens, such as orchids, &c.: only very slight pressure must be given; and subjecting them to constant uniform heat, as in hot sand, placing them in an oven, or suspending and turning them before the fire, enveloping them first of course in paper, indicate some of the modes of proceeding with such-like specimens. When dried they are mounted on paper, and, if they are to be of any scientific value, the generic and specific names of each should be attached, along with all other data bearing on its identity, such as habitat, &c. Care must be taken to preserve specimens from the ravages of moths and beetles by frequent inspection, by the aid of camphor, and by the occasional application of a little corrosive sublimate.

Herbart, JOHANN FRIEDRICH, a German philosopher, was born at Oldenburg, May 4, 1776. At a very early age he was familiar with religious and metaphysical doctrines and discussions, and in his eighteenth year he became the pupil of Fichte at Jena. In 1805 he was appointed extra-ordinary professor of Philosophy at Göttingen; in 1809 he went to Königsberg as Kant's successor; but in 1833 returned to Göttingen, where he remained till his death, August 14, 1841. His collected works were published by his scholar Hartenstein (12 vols. 1850-52; new ed. 1883-93).

Herbart starts from the Kantian position by analysing experience. In his system logic, metaphysics, and aesthetics rank as co-ordinate elements. Logic deals with the formal elements of thought, metaphysics and aesthetics with its content. Of these two the former investigates those of our empirical conceptions which are given us in experience, and which cannot be alienated from our thought, whilst the latter deals with those conceptions which involve judgments of approval or disapproval. The most characteristic features of his thinking are, however, these. He posits a multiplicity of 'reals,' or things which possess in

themselves absolute existence apart from apperception by the mind of man. He rejects the notion of separate mental faculties, substituting in their place the conception of primordial presentations or forces, from whose action and interaction all psychical phenomena result. From the conditions which determine the equilibrium and movement of these presentations he deduces a statics and a dynamics of mind, both amenable to mathematical manipulation, and thus introduces psychology to a place among the exact sciences. Ethics he ranks as a branch of aesthetics; it investigates the agreement or disagreement between volition and the fundamental moral ideas.

His works on the science of education have a peculiar value, and have been much studied of late. See books on Herbert by Drobisch (1876), Strümpell (1894), Ufer (1883; trans. 1896), Felkin (1895), De Garmo (1895), Wagner (1897), Hadaras (1897), Hayward (1902-7), Darroch (1903), Davidson (1906).

Herb Christopher. See BANE BERRY.

Herbelot, BARTHÉLEMY D' (1625-95), orientalist, was born in Paris, and became (1692) professor of Syriac in the Collège de France. His *Bibliothèque Orientale* was completed and published after his death by Galland (1697; 3d ed. 4 vols. 1777-83). It is a dictionary of all knowledge possessed by the Orient, and is principally based upon the Arabic work of Hajji Khalfa; although lacking in critical accuracy, it is full of important information for those who do not read Arabic and other oriental tongues.

Herbert. Herbert Fitz-Herbert was chamberlain and treasurer to King Henry I. Seven or eight generations later, we find the Herberts diverging into several distinct branches, including the lines of the Earls of Powis (now extinct in the male line), of the Lords Herbert of Cheshire (also extinct), the Herberts of Muckross, and also several untitled branches which have flourished upon their ancestral lands in England, Wales, and Ireland. In the reign of Henry V. Sir William Herbert of Raglan Castle, County Monmouth, received the honour of knighthood in reward of his valour in the French wars. His eldest son, a staunch adherent of the House of York, was created Earl of Pembroke by Edward IV. in 1468, but fell into the hands of the Lancastrians after the battle of Tewkesbury, and was beheaded the following day. His son became Earl of Huntingdon.

The title of Earl of Pembroke was restored to the Herberts in 1551 in the person of the son of an illegitimate son of the first earl. The new earl was one of the most influential noblemen of his age, and one who took an active part in public affairs, both as a statesman and a soldier. By his wife, who was a sister of Catharine Parr (the last queen of Henry VIII.), he had a son Henry, second earl, to whose countess, Mary ('Sidney's sister, Pembroke's mother'), Sir Philip Sidney dedicated his *Arcadia*. It has been attempted to identify Shakespeare's 'W. H.,' the 'only begetter' of the *Sonnets*, with the third earl, who succeeded in 1621. The fourth earl, some time Lord Chamberlain to Charles I., and Chancellor of the university of Oxford, was also Earl of Montgomery. The eighth earl held several high offices under Queen Anne, including that of Lord High Admiral. Lord Herbert (q.v.) of Lea was a younger son of the eleventh earl; and his son became (1862) thirteenth Earl of Pembroke, and tenth Earl of Montgomery. The Earls of Carnarvon, more than one of whom have gained celebrity in the field of literature, descend from the eighth Earl of Pembroke mentioned above. The recent Earls of Powis are descended from the same stock maternally, the only child and heiress of the last Earl of Powis of the Herbert

stock having married the eldest son of the illustrious Lord Clive, in whose favour that title was renewed in 1804.

Herbert, EDWARD, LORD HERBERT OF CHESHIRE, soldier, statesman, poet, and philosopher, was born of the ancient and noble House of Herbert, apparently on the 3d March 1583, at Eytton in Shropshire. He was sent to Oxford in his twelfth year, and before he had quite quitted his studies he married an heiress considerably older than himself. On the occasion of the coronation of James I. he was made a knight, and invested with various offices. He left home, accordingly, for France in 1608, and in Paris lived in terms of intimacy with the Constable Montmorency, Isaac Casaubon, and other distinguished men. After a brief return to his native country, he set out again in 1610 for the Low Countries, where he joined the arms of Maurice of Orange; and he again offered him his services in 1614. After a campaign, he travelled through Germany and Italy on horseback, and went as far as Venice, Florence, and Rome. On his way back he got into trouble through an attempt which he made to raise a troop of Protestant soldiers in Languedoc for the Duke of Savoy. Shortly after, he returned to England, and was made a member of the Privy-council; then sent to France, first as extraordinary ambassador, and then as ordinary ambassador. He tried, but without much success, the difficult task of negotiation between Louis XIII. and his Protestant subjects, was ultimately dismissed, and in spite of eager solicitation never received any further appointment. He was elevated first to be a peer of Ireland, and then in 1629 to be a peer of England, with the title of Baron Herbert of Cheshire. When the Civil War broke out he at first sided with the royalists, but ultimately surrendered his castle to the parliamentarians, with whom he afterwards lived on easy terms. He was commonly regarded as having saved his possessions at the expense of his honour. He died in London, 20th August 1648.

The work by which Herbert, the friend of Donne, Selden, Ben Jonson, Grotius, and Gassendi, was best known to his contemporaries is his *De Veritate*—an anti-empirical theory of knowledge, which in many respects anticipates the common-sense philosophy of the Scottish school, and is at times even Kantian. His *De Religione Gentilium* (1663) is a 'natural history of religion,' by means of which Herbert finds that all religions, amidst their extravagances or follies, recognise what were for him the five main articles of religion—that there is a supreme God, that he ought to be worshipped, that virtue and purity are the main part of that worship, that sins should be repented of, and that there are rewards and punishments in a future state. In virtue of this 'charter of the deists,' Herbert is not unjustly reckoned the first of the deistical writers. The *Expeditio Buckinghami Ducis* (1656) is a vindication of his patron's ill-fated expedition. The ill-proportioned *Life and Reign of King Henry VIII.* (1649) glorifies Henry overmuch, and is by no means accurate. His best-known work, the *Autobiography*, a brilliant picture of the man and of contemporary manners, may fairly be regarded as a masterpiece in its kind; but it is disfigured by overweening conceit and self-glory in his own personal beauty, noble blood, valour in Quixotic duels, favours from famous ladies, and generosity, and is not to be regarded as veracious. It comes down only to 1624. The *Poems*, Latin and English, which may be divided into sonnets, elegies, epitaphs, satires, miscellaneous lyrics, and occasional pieces, reveal in their author a representative of Donne's, or the 'metaphysical,' school;

many have been held to be true poetry, in some respects resembling Browning, in some anticipating Tennyson. See Rémusat's monograph (1874); Güttinger on Herbert's philosophy (1897); Churton Collins's (1881) and Moore Smith's (1923) edition of the Poems; and Sir Sidney Lee's of the Autobiography, with introduction and continuation (1886).

Herbert, GEORGE, an English poet, was born in Montgomery Castle, in Wales, on the 3d April 1593. His family was a younger branch of that of the Earls of Pembroke. His eldest brother was Lord Herbert (q.v.) of Cherbury, who says of him: 'My brother George was so excellent a scholar that he was made the public orator of the university of Cambridge, some of whose English works are extant, which, though they be rare in their kind, yet are far short of expressing those perfections he had in the Greek and Latin tongue, and all divine and human literature. His life was most holy and exemplary, in so much that about Salisbury, where he lived beneficed for many (?) years, he was little less than sainted. He was not exempt from passion and choler, being infirmities to which our race is subject; but, that excepted, without reproach in his actions.' George Herbert's mother was a Newport, of the old Shropshire family of the Newports of High Ercall. She was left a widow, and devoted herself to the education and training of her seven sons, in which effort she was singularly successful. Her memory has come down to us as one of those many mothers of the English race to whom it owes so much. Under her influence and that of Dr Neville, Dean of Canterbury and Master of Trinity College, Cambridge, the foundations were laid of a character of almost perfect beauty. In 1614 George Herbert was elected Fellow of his college, and in 1619 promoted to the office of Public Orator, in which place he continued eight years, and, as Izaak Walton says, 'managed it with as becoming a grace and gaiety as any had ever before or since his time.' 'If during this time,' he continues, 'he expressed any error, it was that he kept himself too much retired, and at too great a distance from all his inferiors, and his clothes seemed to prove that he put too great a value on his parts and parentage.' The antecedents of his family, indeed, and his position at the university, naturally led him to expect advancement at court; but on the death of King James his thoughts became more decidedly drawn towards a distinctly religious life—a life which his mother had always wished him to follow. After a period of seclusion in the country, he finally decided to relinquish all expectation of court favours, and to devote himself entirely to the religious life. In 1626 he was made prebendary of Layton Ecclesia in the diocese of Lincoln, and in 1630, the year after his marriage to a kinswoman of the Earl of Danby and daughter of Mr Charles Danvers of Bainton, Wilts, he was presented, by the favour of his kinsman the Earl of Pembroke, to the vicarage of Bemerton, near Salisbury; Charles I. saying, when the earl solicited the presentation which had lapsed to the crown, 'Most willingly to Mr Herbert, if it be worth his acceptance.' He only enjoyed this vicarage for three years, being buried on 3d March 1633; yet in that short time he left a memory which still survives. No one who reads his *Country Parson*, a description of an ideal parson's life, which is doubtless to a considerable extent a picture of his own life and conduct, will be surprised at this fact. Walton says of him, 'his aspect was cheerful, and his speech and motion did both declare him a gentleman; for they were all so meek and obliging that they purchased love and respect from all that knew him.' He was naturally the intimate of the most cultured natures of his day, but the reality of religious life led him, as it

has done others, to a perfect sympathy with the uncultured and the ignorant. He was an accomplished musician, who recognised in music not a science only, but a divine voice; and his poetry is the natural result of his training and of his life. It exhibits a singular combination of the attributes of a courtier, a gentleman, and a saint. It manifests a knowledge of life and of the world, and a certain strength and force of thought and of expression which has made his verses the favourite reading of men who are not generally attracted to sacred and devotional poetry; and this quality will probably ensure for his poems a lasting, though perhaps limited, number of students and admirers.

See his *Works in Prose and Verse*, with Life by Walton, and notes by Coleridge (1846); editions by Nichol (1863), Grosart (1876), Waugh (1908), and Palmer (1920), and a book by A. G. Hyde (1906).

Herbert, SIDNEY, LORD HERBERT OF LEA, minister and statesman, was the son of the eleventh Earl of Pembroke by his second wife, the daughter of Count Woronzow, and was born at Richmond, 16th September 1810. Educated at Harrow and at Oriel College, Oxford, he devoted himself to public life, and entered the House of Commons in 1832 as member for South Wilts, which he represented until his elevation to the peerage in 1861. He began his political career as a Conservative, and was Secretary to the Admiralty in Sir R. Peel's administration from 1841 to 1845, when he became Secretary-at-war. It fell to him to oppose Cobden's motion for a select committee to inquire into the effect of the corn laws. He went out of office with his party in 1846. In 1852 he was again Secretary-at-war, under the Aberdeen ministry, and, in consequence, the 'horrible and heart-rending sufferings' of the army before Sebastopol were laid in a great degree at his door. He was for a few weeks Palmerston's Colonial Secretary in 1855, and his Secretary-at-war in 1859. Great improvements in the sanitary condition and education of the army, the amalgamation of the Indian with the imperial army, and the organisation of the volunteer force signalised his army administration. He largely reformed the War Office, but was by failing health compelled to resign his seat in the House of Commons, and in 1861 was made Baron Herbert of Lea. He died 2d August 1861. See the long-delayed Life of him by Lord Stanmore (1906), which sheds much light on cabinet secrets. He was heir-presumptive to the earldom of Pembroke, and his son (1850-95, author of *South Sea Bubbles*) became in 1862 thirteenth earl.

Herbs, or HERBACEOUS PLANTS, are those which do not form a *persistent* woody stem above ground. They are annual, biennial, or perennial. An annual springs from seed, blossoms and dies in one season. A biennial vegetates only during the first growing season, and stores up nourishment in its root-stock which persists through the winter; during the second growing season the root-stock sends up flowering shoots, and after fructification the whole plant dies. When the root-stock perennates, and only the aerial shoots die at the end of each growing season, the plant is perennial. See POT-HERBS.

Herculaneum, an ancient city of Italy, so called from the local worship of Hercules, was

situated at the north-western base of Mount Vesuvius, about 5 miles E. of Naples. Considerable obscurity envelops its early history; it is supposed, however, to have been of Phœnician origin, and to have been occupied afterwards by Pelasgians and Oscans. It subsequently was conquered, with all the rest of Campania, by the Samnites, and later it fell into the hands of the Romans. In 63 A.D. the city was seriously injured by a violent earthquake; and in 79 it was buried, along with Pompeii and Stabiae, by the memorable eruption of Vesuvius (q.v.) which took place in that year. It now lies at a depth of from 40 to 100 feet below the surface, and is filled up and covered with volcanic tufa, composed of sand and ashes, and consolidated to some extent by water, which is often thrown up in great quantities during volcanic eruptions. Above it, on the modern surface, are Portici and Resina, two villages now absorbed in

baths and of the accessory buildings have been brought to light. Among the art-relics of Herculaneum, which far exceed in value and interest those found at Pompeii, are the statues of Æschines, Agrippina, the Sleeping Faun, the Six Actresses, Mercury, the group of the Satyr and the Goat, the busts of Plato, Scipio Africanus, Augustus, Seneca, Demosthenes, &c. These treasures, together with such vases and domestic implements as have been found, are in the National Museum at Naples.

Hercules (Gr. *Hēraklēs*), the beloved son of Zeus by Alcmena (of Thebes), was intended by his father to be king of the Argives; but Hera, the jealous spouse of Zeus, by a trick caused Eurystheus to become king of Argos. Nor was her wrath satisfied with this; she made Hercules serve Eurystheus, by far the inferior man. And he en-

joined hard adventures on Hercules, even sending him to Hades to fetch up the dog Cerberus. Thus Hercules was doomed to a life of trouble, and became the type amongst the Greeks not only of manly strength, but of manly endurance. Besides the labours imposed on him by Eurystheus, Hercules undertook adventures on his own account, killing a sea-monster that ravaged Troy, and destroying Troy when the mares promised him as reward for killing the monster were denied him. His love of horses also led him to kill Iphitus, though his guest. Finally, after death, he himself joined the banquet of the deathless gods, with Hebe as his wife; but his phantom, armed with bow and arrow and gold baldric, with wild boars and lions wrought upon it, terrified the dead in Hades. Thus far according to Homer.

Hesiod adds four more labours, imposed by Eurystheus—the destruction of the Nemean lion, of the Lernean hydra, fetching the oxen of the triple-bodied Gery-

General view of the Excavations at Herculaneum.

the suburbs of Naples. In 1706, on the occasion of deepening a well, fragments of mosaics were first brought up; but little was done for systematic excavation till 1738, when explorations were commenced under royal authority. It was then discovered that the building near the bottom of the well, from which the first relics were obtained, was the theatre. This building was forthwith explored and cleared, and several statues, both in bronze and marble, were extracted from it. Excavations were carried on but to a limited extent, not only in consequence of the hardness of the tufa, but from the fear of undermining the dwellings on the surface. Hence but a portion of this entombed city is yet visible, the chief edifice shown being still the theatre, which had been built a short time before the fatal eruption. It has eighteen rows of stone seats, and could accommodate 8000 persons. Part of the Forum with its colonnades, another colonnade, several small temples, and a villa were also discovered. From these buildings many beautiful statues and remarkable paintings have been obtained; and in the villa was found a library of nearly two thousand papyri, some of which, mostly philosophical treatises reflecting the Epicurean standpoint, have been published as *Herculaneensium voluminum quæ supersunt*. Subsequent excavations yielded important results, particularly as to the plan of Herculaneum, and ruins of extensive

ones, and the golden apples of the Hesperides; and Hesiod includes amongst the *parerga*, or voluntary exploits, freeing Prometheus from the eagle which tortured him. From later authors we hear of yet more labours, the number of which was first fixed at twelve by Pisander (who lived about 650 B.C., and wrote an epic poem on the adventures of Hercules), though this number was not regarded as a canon either of poetry or art. They are the destruction of the Erymanthian boar, and of the Stymphalian birds; the capture of the Cretan bull, of the stag of Ceryneia, and of the horses of Diomedes; the cleansing of the stables of Augeas; and obtaining the girdle of the queen of the Amazons. Many voluntary exploits are added by later writers to the *parerga* mentioned by Homer and Hesiod, and are as a rule brought into connection with the Homeric story of Hercules, the outlines of which they fill up. Thus, Homer mentions Megara as the wife of Hercules; later writers recount that she was the daughter of the king of Thebes, and that her hand was bestowed on the hero in reward for having freed the Thebans from their tribute to the Minyæ. The story of Hercules' service as a slave to the Lydian Omphale is connected with the Homeric story as being the atonement for the murder of Iphitus. When all other resources fail, topography is made to afford the connection. Thus, the fight with the Centaurs

is connected with the labour of destroying the Erymanthian boar, because the scene of the one adventure is in the neighbourhood of the other. It is on his way to Thrace in quest of the horses of Diomedes that Hercules rescues Alcestis, who had given her life for that of her husband Admetus, the guest-friend of Hercules. It is on his way back from the west, when he is returning with the cattle of Geryones by way of Italy to Greece, that he destroys the monster Cacus, who stole his oxen. It is on his way to Gadira in search of Geryones' oxen that he travels in the mystic beaker given to him by the sun-god. And finally, it is *en passant* that he founds the Olympian games also. But in all cases we find that Hercules has become the national hero of the Greeks, and that he is regarded not only as the type of manly endurance, but also as the self-sacrificing hero who succours the oppressed and rids earth of its monsters. As to the manner of his death nothing is said by Homer, but in later times the story was, that, in the agonies caused by the poisoned robe of Nessus sent to him in all innocence as a love-charm by his wife, Deianira, he threw himself on to a funeral pyre on Mount Ceta, and was thence carried up to heaven.

It is maintained by some scholars that the origin of Hercules as a mythical figure is not Greek, not even Indo-European, but oriental. And in support of this view there are traits to be found both in literature and art which are undoubtedly oriental. Thus in literature the mystic beaker in which Hercules travels to Gadira is undoubtedly the symbol of the oriental sun-god. The number (twelve) of Hercules' labours is that of the signs of the zodiac. In art the lion-skin which is the characteristic garb of Hercules is undoubtedly a loan from the East; and the resemblances between ancient types of Hercules and the idols of the Phœnician god Besa are undeniable. And even the Greeks themselves identified Hercules with Melcarth of Tyre. In his physical strength Hercules brings to mind Samson, and Samson, on the other hand, has been explained by a venturesome mythologist (Goldziher) as being, like Hercules, a solar hero. But on examination the hypothesis of the oriental origin of the figure of Hercules breaks down. It is quite true that there are amongst the many and diverse elements in the myth of Hercules some of undoubtedly oriental origin; but none of these can be traced back further than the time of Pisander. The story of Hercules as told in Homer is purely Greek. Thus the number (twelve) of Hercules' labours, which forms such an admirable basis for the theory that Hercules is a solar hero and of oriental origin, cannot be traced back further than the time of Pisander, by whom it may well have been borrowed from some eastern story, for he lived in Rhodes, which was exposed to oriental influences. The beaker of the sun-god, again, is borrowed from the East, but is no part of the equipment of the original Homeric Hercules. The lion-skin, which subsequently became the characteristic garb of Hercules, was imported from the Orient. This is indicated by the fact that Pisander first introduced it into literature, and is confirmed by the circumstance that it appears in art for the first time in images from Cyprus, which were plainly produced (as might be expected in Cyprus) under oriental influences. But the lion-skin is not found in literature older than Pisander, and it is uniformly absent from older works of art. Finally, the resemblances between the ancient types of Hercules and the idols of the Phœnician Besa are in part due to the fact that the latter date from the time when Phœnician art was already under the influence of Greek.

That the Greeks themselves identified Hercules with some strange god, whether of Egypt or of

Tyre, is natural enough, but proves nothing. They, like the Romans, were ever on the alert to identify the gods they knew of old with the new deities of foreign nations. Indeed, it is in this tendency that we have to look for the explanation of the growth of the story of Hercules. It is because the Greeks recognised, or thought they recognised, their national hero in the oriental sun-god, that traits and stories belonging to the latter became attached to the former. In this way the hero of the Lydian story was identified with Hercules, and the story of his service to Omphale transferred to Hercules. On the same principle we may probably detach the Italian story of the monster Cacus as an accretion. The Italians recognised in Hercules their own native Genius Jovis, of whom the Cacus-story was originally told. Not only was the story absorbed into the Hercules-cycle of myths, but Hercules eclipsed the Genius Jovis in Italy itself. It has, indeed, been supposed that the story of Hercules was known to the Græco-Italians, the common ancestors of Greeks and Italians; but, apart from the doubt which now attaches to the very existence of Græco-Italians, the Latin name Hercules is undoubtedly (like that which it stands for) borrowed from the Greek. Hercules, as a matter of philology, is a loan-word from the Greek Heracles.

Not only, however, is it possible to strip the original Homeric story of Italian and oriental accretions; it is also possible to trace its growth within the limits of Hellas itself. For as the Greeks identified their national hero with foreign deities and heroes, so Hercules came to be the national Greek hero, because the various Greek states identified him with various local heroes. Thus the Ætolian myth of Deianira and the robe of Nessus came to be attached in the time after Homer to Hercules. And even in the Hercules of Homer and Hesiod we can detect at least two local heroes. The son of Alcmena of Thebes was probably not originally the same hero as the Hercules whose exploits in destroying the Lernaean hydra, Nemean lion, and the Erymanthian boar are localised in the Peloponnese. And this view is confirmed by the fact that, whereas the Peloponnesian hero is named Heracles, the Theban hero was known as Alcæus ('the strong man'), or Alcides ('son of strength'), and compilers of myths had to allege that the change of name from Alcides, the less known name, to Hercules, the better known, was ordained by the Delphian oracle.

Further back than this it seems impossible to trace Hercules. There is no reason to imagine that Hercules was known to the Indo-Europeans before their dispersion; and even if some of his adventures (e.g. the oldest labour—that of fetching up Cerberus from the nether world) are really solar in character, we need not close our eyes to the fact that the strong man is a natural subject for myths.

In art, Hercules is represented as the type of manly strength, with muscular limbs, curly hair, and somewhat small head; a club and lion's skin are often added. The most notable statue is the so-called Farnese Hercules, found

Farnese Hercules.

in the baths of Caracalla in 1599, and now in the museum at Naples. It is the work of the Athenian Glycon, but probably a copy of a work by Lysippus.

Hercules, PILLARS OF, the name given by the ancients to two rocks flanking the entrance to the Mediterranean at the Strait of Gibraltar. According to one version of the legend, they had once been united, but Hercules tore them asunder to admit the ocean into the Mediterranean; another version represents him as causing them to unite temporarily in order to form a bridge. They seem to have been first visited by the Phœnicians about 1100 B.C. Calpe, one of them, is now identified with Gibraltar, and Abyla, the other, with Ceuta.

Hercules Beetle (*Dynastes hercules*), a gigantic lamellicorn beetle from tropical America, sometimes 6 inches in length. The male bears on the thorax an enormous horn, which is met by a shorter upturned horn from the head, the whole resembling a pair of large but somewhat unequal pincers, of which the body of the insect is the

Hercules Beetle (*Dynastes hercules*).

handle. The female is without horns, and decidedly smaller. Another species, *D. titigus*, about 2 inches in length, occurs in the United States. The genus *Megasoma* is nearly allied to *Dynastes*. See also GOLIATH BEETLE.

Hercules' Club is the trivial name of a West Indian tree (*Xanthoxylum clava-Herculis*), for a kind of gourd, and for a species of *Aralia*.

Hercynian Forest (Lat. *Hercynia silva*), the general designation of the entire wooded mountain-ranges of middle Germany, from the Rhine to the Carpathian Mountains. Modern geologists apply the term Hercynian system to all the mountain-chains between Westphalia and Moravia—all older than the close of the Cretaceous period.

Herd, DAVID (1732-1810), born a Kincardineshire farmer's son, spent his life as an Edinburgh clerk and in literary work, being remembered for his collection of *Ancient Scottish Songs* (1776; re-edited with Life, &c., by Hecht, 1904).

Herder, JOHANN GOTTFRIED, one of the most thoughtful and suggestive of German writers, called by De Quincey the Coleridge of Germany, equally important as a philosopher, a theologian, and a literary critic, was born at Mohrungen, in East Prussia, on 25th August 1744. He studied at Königsberg, and there became acquainted with Kant and Hamann, the 'Magus of the North.' The latter inspired young Herder with love for the poetry of primitive peoples and the study of the obscure beginnings of civilisation, and for the literature and lore of the Orient, especially of the Bible. But perhaps the greatest thing that Hamann did for Herder was to awaken him to intellectual freedom, to emancipate his mind from traditional habits of thinking and stimulate him to prosecute lines of independent search. In 1764 Herder became assistant-teacher in a school, and assistant-pastor in certain churches, in Riga. Being convinced that literature was to be his life's calling, he began to practise it by writing *Fragmente über die neuere deutsche Literatur*

(1766-67), *Die kritischen Walder* (1769), and minor pieces, in which he maintained that the truest poetry is the poetry of the people, the spontaneous, unartificial expression of the characteristic human nature that is in them; and, in the spirit of Winckelmann and Lessing, he took up a brief for the idiosyncratic development of national genius in opposition to the fashionable pseudo-classicism of the day. He was an impressive preacher, the subject of his sermons, as of all his writings, being man *qua* man in all phases of his essential and complex nature. Leaving Riga in 1769, he spent some months in travel. It was during this tour that he made the acquaintance of young Goethe at Strasburg; from Herder the future literary imperator of Germany learned to understand the realities of life. In 1770 Herder accepted the appointment of court-preacher at Bückeberg; but six years later he exchanged this uncongenial post for that of first preacher in the town church of Weimar, a position which, partly owing to untoward circumstances, partly—and perhaps principally—to his own innate irritability of temper, proved to be little less uncongenial, in spite of his intercourse with Goethe and the other literary celebrities then gathered in Weimar. It was there that Herder died on 18th December 1803.

Herder's love for simple truth warm with the blood of life's reality, in preference to classic grace and coldness, found expression in an admirable collection of folk-songs, *Stimmen der Völker in Liedern* (1778-79), a work on the spirit of Hebrew poetry (1782-83; trans. 1833), a treatise on the influence of poetry on manners (1778); in oriental mythological tales, in parables and legends, in his version of the *Cid* (1805), and other works. The supreme importance of the historical method is fully recognised in these and a book on the origin of language (1772), and especially in his masterpiece, *Ideen zur Geschichte der Menschheit* (1784-91; trans. 1800), which is remarkable for its anticipations and adumbrations of evolutionary theories. Higher and higher types of organisation are found in all things, stones, plants, and animals, until the culminating type is reached in man, the first link in a still higher series of existences. His last work (apart from an ill-advised polemic against Kant) was the *Humanitätsbriefe* (1793-97). One of the founders of the historical school in literature, he was the very influential pioneer of the Romantic movement, and a herald of the golden age of German national literature.

His works were edited by Suphan (32 vols. 1877-1909). See *Erinnerungen* by his widow (1830); the *Lebensbild* by his son (1846-47); various collections of his Letters; and works on him by Haym (1885), Nevins (1884), Kühnemann (1896; 2d ed. 1912), and Bürkner (1904).

Here. See HERA.

Heredia, JOSÉ MARIA DE (1842-1905), French poet, born of a wealthy family in Cuba, came in boyhood to France, where he was educated, and where, with short intervals, he subsequently lived. He printed occasional poems, sonnets, &c. for private circulation, and though a Spaniard born, he gradually came to be reckoned one of the most gifted and accomplished of French poets. A collection, *Les Trophées*, published in 1893, dealt largely with the Conquistadores. He was admitted to the Académie in 1894. See Gosse's *Critical Kit-kats* (new ed. 1913), and a study by Ibrovac (Paris, 1923).

Heredity, the organic or genetic relation between successive generations—especially between offspring and their parents. Every living creature reproduced in the ordinary way arises from a parent or parents more or less like itself; this genetic relation has a visible material basis in the germinal

matter (usually egg-cell and sperm-cell) liberated from the parent or parents; by inheritance we mean all the qualities or characters which have their initial seat (we cannot picture how) in the fertilised egg-cell; the expression of this inheritance under the influence of appropriate nurture is the development of the organism. Thus heredity is no entity, force, or principle, but a convenient term for the genetic relation between successive generations, and inheritance includes all that the organism is or has to start with in virtue of its hereditary relation. If the hereditary 'nature' implicit in the fertilised egg-cell is to develop normally it must have an appropriate 'nurture'—a manifold set of environmental influences—a sort of external heritage. Changes in this nurture often induce 'modifications' in the expression of the hereditary nature, and it is often possible to distinguish in an organism the main features which are the normal realisations of the inheritance in a normal environment from superimposed peculiarities due to peculiarities in nurture. But besides the modifications which may make offspring different from their parents, there are intrinsic variations of diverse kinds which are due to some individual peculiarity in the germ-cells. The tendency of the genetic relation is to make for continuity, persistence, or complete hereditary resemblance; but it leaves many loopholes for the escape, as it were, of those new departures, idiosyncrasies, or variations which seem to form the raw materials of organic progress. As to the modifications due to nurture, it is certain that they have individual importance, but it is uncertain whether they have direct racial importance, there being no secure evidence that they can be transmitted as such or even in any representative degree.

The general fact of heredity is that *'like tends to beget like.'* The present is the child of the past; our start in life is no haphazard affair, but is rigorously determined by our parentage and ancestry; all kinds of inborn characteristics of an organism, whether physical or psychical, normal or abnormal, important or trivial, are transmissible to the offspring, if the possibility of having offspring has not been excluded. This is not to say that all the inborn characters are transmitted; the statement is that all kinds of them are transmissible, even such subtle characters as longevity and fertility. There is a broad basis of specific characters from which there is rarely more than slight divergence; there is much greater variability in the more detailed characters which mark breeds, races, stocks, and the like within the species. In using the phrase *'like tends to beget like'* we express the fundamental condition of organic evolution, that the genetic relation which we call heredity admits on the one hand of a continuity of hereditary resemblance from generation to generation, and, on the other hand, of an organic changefulness which we call variability. Without hereditary resemblance and hereditary variation there could have been no evolution.

The Physical Basis of Inheritance.—In all cases of ordinary sexual reproduction, the vehicle of the inheritance is necessarily to be found in the germ-cells, and there is strong evidence to show that the nuclear bodies or chromosomes in particular stand in some definite causal relation to the adult characters. As the ovum is much larger than the spermatozoon, it furnishes, in addition to a complement of hereditary characters, the initial capital—including it may be a nutritive legacy of yolk—for the early development of the embryo. In a few cases it has been clearly shown that the cytoplasm of the ovum is not isotropic, but is mapped out into areas of diverse significance. From the spermatozoon, besides the complement

of hereditary qualities, there comes a minute body called the centrosome, 'the weaver at the loom of cell-division,' which plays an important part in the segmentation of the fertilised ovum. In the ovum and the spermatozoon there are the same number of chromosomes, half the normal number characteristic of the organism in question, and there is no doubt that each of the germ-cells carries a complete set of the general hereditary characteristics. Thus in some cases of artificially induced parthenogenesis an ovum may develop into a complete embryo without being fertilised; in other cases an embryo may be reared from a de-nucleated and then fertilised ovum, or from a fertilised non-nucleated quarter of an ovum. The progress of research has confirmed Huxley's prophecy of 1878: 'It is conceivable, and indeed probable, that every part of the adult contains molecules derived both from the male and from the female parent; and that, regarded as a mass of molecules, the entire organism may be compared to a web of which the warp is derived from the female and the woof from the male.' But this idea requires to be safeguarded in various ways. (1) While each germ-cell bears a complete equipment of the general hereditary qualities, this does not apply to the contrasted minor characteristics of breeds and varieties. In the progeny of cross-bred organisms, some seem to be entirely—even germinally—without certain grand-paternal or certain grand-maternal characteristics. (2) Inheritance, though always dual in ordinary cases of sexual reproduction, is also multiple, for the hereditary material of each parent is also dual, being derived from grandparents, and so on backwards. (3) It is always necessary to distinguish between the inheritance and the expression of the inheritance, as is plain in cases where a characteristic 'skips a generation.' An inheritance may seem less dual than it really is, simply because the peculiar features of one of the parents remain latent, either for lack of liberating stimulus or because of unequal strength in developmental capacity. Let us now inquire how it is that the germ-cells are able to develop into organisms essentially like the parents.

Pangeneses.—Many naturalists have attempted to explain the uniqueness of the germs or germ-cells by regarding them as concentrations of units collected from the various structures of the body. The hypothetical process by which these units are given off from the various organs, travel to the seat of the germs, and are there accumulated to reproduce in the embryo structures like those whence they originated, is termed pangeneses. At such different epochs as are suggested by the names of Democritus and Hippocrates, Paracelsus and Buffon, pangeneric theories were advanced. The first clear theory, however, was that of Spencer (1864), who suggested the existence of 'physiological units,' derived from and capable of development into cells, and supposed their accumulation in the reproductive elements. But the best-known form of the theory is Darwin's 'provisional hypothesis of pangeneses' (1868), according to which (a) every cell of the body, not too highly differentiated, throws off characteristic gemmules, which (b) multiply by fission, retaining their peculiarities, and (c) become specially concentrated in the reproductive elements, where (d) in development they grow into cells like those from which they were originally given off. Somewhat later (1876) the ingenious Jäger sought to replace Darwin's gemmules by characteristic 'scent-stuffs,' which were collected from the body into the reproductive elements; he suggested, in other words, what may be called chemical pangeneses. Meanwhile (1872) Galton had been led by his experiments on the transfusion of blood and by other considerations to the conclusion that 'the doctrine of pan-

genesis, pure and simple, is incorrect.' While reaching forward to something better, he still allowed a limited pangenesis to account for those cases which suggest at least that acquired characters are 'faintly heritable.' He admitted that a cell 'may throw off a few germs [i.e. gemmules] that find their way into the circulation, and have thereby a chance of occasionally finding their way to the sexual elements and of becoming naturalised among them.' In 1883 Professor W. K. Brooks proposed an important modification of Darwin's theory, especially insisting on the following three points: that it is in unwonted and abnormal conditions that the cells of the body throw off gemmules; that the *male* elements are the special centres of their accumulation; and that the *female* cells keep up the general resemblance between offspring and parent. For criticism of the numerous suppositions involved in the various theories of pangenesis, the reader is referred to the works of Galton, Ribot, Brooks, Herdman, Plarre, De Vries, and others (see bibliography); it is enough for our purpose to notice, in the light of the next step of progress, the comparative gratuitousness of any such special theories.

Fact of Continuity.—As far back as 1849 Owen pointed out that in the developing germ it was possible to distinguish between those cells which became much changed to form the 'body,' and those which remained virtually unchanged and formed the reproductive organs. The same distinction was emphasised by Haeckel and by Rauber, while Jäger expressed his views very explicitly as follows: 'Through a great series of generations the germinal protoplasm retains its specific properties, dividing in development into a portion out of which the individual is built up, and a portion which is reserved to form the reproductive material of the mature offspring.' This reservation, by which the germinal protoplasm is sheltered from external or corporeal influences, and retains its specific and embryonic characters unchanged from the parent ovum, Jäger called, by a now famous phrase, 'the continuity of the germ-protoplasm.' Brooks (1876, 1877, 1883) was not less clear: 'The ovum gives rise to the divergent cells of the organism, but also to cells like itself. The ovarian ova of the offspring are these latter cells, or their direct unmodified descendants. The ovarian ova of the offspring thus share by direct inheritance all the properties of the fertilised ova.' In the same way Galton (1872, 1875), using the term 'stirp' to express the sum-total of germs, gemmules, or organic units of some kind in the fertilised ovum, maintained that a certain residue is kept apart from the development of the body to form the reproductive elements of the offspring. The history must also include Nussbaum, who likewise called attention to the very early differentiation and isolation of the sex-elements to be observed in the development of some animals. The general notion independently suggested by the above naturalists is simple enough. At an early stage in the development of the embryo, the future reproductive cells of the organism are distinguishable from those which are forming the 'body.' The latter develop in manifold variety, and soon lose almost all likeness to the fertilised ovum. The former—the reproductive rudiments—are not implicated in the upbuilding of the 'body,' remain virtually unchanged, and continue the protoplasmic tradition unaltered so as to start a new organism on the same lines—i.e. with the same protoplasmic material. It is evident that a fertilised egg-cell with certain characters, *a, b, c*, will develop into an organism in which these characters *a, b, c* are variously expressed; but if at an early stage certain cells are set apart, retaining the characters

a, b, c in all their entirety, then these will be on the same footing as the original fertilised egg-cell, able like it to give rise to an organism, and necessarily to a similar organism. This explanation of heredity is at once so simple and so satisfactory that it becomes a most important question to determine how far the above facts are

Fig. 1.

I, original ovum; ABC, body of organism to which it gives rise; O, chain of ovarian ova, with properties *a, b, c* retained; I', liberated ovum of next generation, virtually equivalent to I.

actually true among plants and animals. The answer is that they are as yet demonstrable only in a minority of cases. Thus, it is true that an early appearance or insulation of reproductive cells, materially continuous and presumably identical with the ovum itself, has been observed in some worm-types (leeches, Sagitta, thread-worms, Polyzoa), in some Arthropods (e.g. *Moina* among Crustaceans, *Chironomus* among Insects, Phalangidae among Arachnids), and with less distinctness in a number of other organisms. But it must be distinctly allowed that in *most* cases it is only after development has progressed for some time that the future reproductive cells make their distinct appearance. Therefore, if distinct cellular continuity be only demonstrable in a minority, it becomes necessary to modify the generalisation. The required modification is due to Weismann, whose theory must be briefly stated. (1) A small portion of the effective substance of the fertilised egg-cell remains unchanged during the development, and serves as a foundation from which the germ-cells of the new organism are produced. (2) This important substance—the 'germ-plasma'—which keeps up continuity from one generation to another, is part of the nucleus, possesses an exceedingly complex minute structure, but has great stability, for it absorbs nourishment and grows enormously without the least change in its molecular constitution. (3) But while part of this special nuclear substance or germ-plasma of the egg-cell is reserved unchanged for the formation of the germ-cells of the resulting organism, part of it is changed into the nuclei of the ordinary body-cells, where, however, it sometimes retains enough of its original efficiency to be able to repair serious injuries or start the development of a new organism in *asexual* reproduction.

It can hardly be doubted that in the more or less direct continuity between the successive sets of reproductive products lies the solution of the main problem of heredity. The germ-cells which give rise to offspring are unique in their continuity with those which give rise to the parents, and it is this continuity or the involved sameness of material which explains the production of like by like. In the simplest animals or Protozoa, organism A buds and hands on a fraction of its living matter to A¹, which, being so really part and parcel of A, must grow up into a similar adult Protozoan. With higher animals the same holds true, though the continuity, as expressed in the figure, is less direct. At various levels of analysis suggestions have been made which attempt to render the fact of continuity more luminous. Thus Professor Hering and Samuel Butler suggested about the same time a psychical aspect of hereditary continuity, according

to which memory is regarded as a general function of organised matter, and the reproduction of parental likeness as due to an unconscious recollection of the past. Haeckel also emphasised the luminous metaphor of 'organic memory,' but sought to express this in terms of molecular motion. The invisible activity of the organic molecules he compares to a complex wave-motion, harmonious and persistent from generation to generation, though capable of incorporating the results of fresh experience. The periodic wave-motion of the molecules he describes characteristically as 'the perigenesis of the plastidules.' In metaphorical language, the molecules remember or persist in the rhythmic dance which they have learned.

The idea of germinal continuity has an obvious social application. It enables us to realise that the germ is virtually as old as the parent, and that the main line of hereditary connection is not that between parent and child, but 'that between the sets of elements out of which the personal parents had developed, and the set out of which the personal child had developed.' 'The main line,' Galton says, 'may be rudely likened to the chain of a necklace, and the personalities to pendants

Fig. 2.—The Relation between Reproductive Cells and the Body.

The continuous chain of dotted cells at first represents a succession of Protozoa; further on, it represents the ova from which the 'bodies' (undotted) are produced. At each generation a spermatozoon fertilising the liberated ovum is also indicated.

attached to the links.' To this fact social inertia is largely due, for the organic stability secured by germinal continuity hinders evolution by leaps and bounds, either forwards or backwards. That a good stock is pre-eminently valuable is an obvious truth.

Modes of Inheritance.—While it remains true that prediction in regard to the result of any

A—A³, the bodies of successive generations; a—a³, the germ-cells between which the real continuity obtains.

individual pairing is apt to be false, there are some cases where the actual result is almost a foregone conclusion, and some cases where the average result may be foretold with certainty. When the eggs are numerous enough the chicks may be not only counted but classified before they are hatched. (1) When similar forms are bred together for several generations a certain uniformity of type is likely to result. When selection accompanies the inbreeding, the least similar forms being consistently removed, the likelihood of uniformity increases. Variability is restricted within narrow range; the offspring closely resemble their parents and one another. Experiments with cereals in particular show that a 'pure line' (the descendants of a single individual in a self-fertilising race) is very constant from generation to generation, a fact of great practical importance. (2) When the two parents are different, the offspring may be a blend of paternal and maternal characteristics. In a cross between a long-eared lop rabbit and a short-eared breed, Castle found that forms with ears of intermediate length were produced, and that these intermediates bred true. Galton gave

skin colour as a good illustration of this *blended* inheritance. (3) In other cases the offspring may show a coarse-grained or non-blended combination of paternal and maternal characteristics, the former showing in one part of the body, the latter in another part. This is called *particulate* inheritance, and may be illustrated by the piebald foal of a light horse and a dark mare, or by a sheep-dog with an eye like its father's on one side of its head and an eye like its mother's on the other. (4) It often happens that the offspring seems to take wholly after one of its parents as regards particular characters or sets of characters. This *exclusive* inheritance, as it has been called, may be the first step in alternative or Mendelian inheritance. (5) In many cases the mode of inheritance is now known to conform to that discovered by Mendel in 1865, and rediscovered in 1900 by the botanists De Vries, Correns, and Tschermak. In its simplest expression, Mendel's law may be stated as follows: If A be a well-established, pure-bred variety with a certain well-defined, clear-cut character—e.g. of stature or colour—and B be another well-established pure-bred variety in which the corresponding character is different, and if A and B are crossed, the hybrid offspring will usually more or less markedly resemble one of the parents as regards the particular distinguishing character. The character which finds exclusive or predominant expression is called the *dominant*; the character which remains latent is called the *recessive*. Thus when a tall pea and a dwarf pea are crossed the offspring are all tall, and it is said that tallness is the dominant character and dwarfness the recessive character. Now, if the hybrids be bred together their descendants will be of two kinds; three-fourths of the offspring show the dominant character and one-fourth the recessive. When those with the recessive character are inbred they yield only recessives; in other words, they are quite pure, showing no trace of the dominant character. When those with the dominant character are inbred, a third of them yield pure dominants only, while two-thirds of them yield *apparent* dominants like the original hybrid—that is, with the power of throwing off when inbred more pure recessives, more pure dominants, and more apparent dominants like the original hybrid—the average proportions being always 1D+2D(R)+1R, as regards the two contrasted characters of D or R. Thus, in the case of the peas, the hybrid 'talls,' allowed to self-fertilise (which comes to the same thing as inbreeding with similars), produced 'talls' and 'dwarfs' in the proportions 3:1. But of these 'talls' one-third were pure as regards tallness, while two-thirds were impure, yielding talls and dwarfs in the usual proportions when inbred. This law of Mendel, or of alternative inheritance, has been shown to apply to the contrasted characters of peas, beans, maize, wheat, barley, garden-stock, nettles, and some other plants; of mice, rats, rabbits, guinea-pigs, poultry, canaries, snails, silkmoths, and some other animals; and there is every likelihood that it will be found to have a very wide application.

Mendel's Theory.—Mendel not only discovered a remarkable law; he gave a hypothetical rationale of it. He supposed that the germ-cells or gametes produced by the hybrids are of two kinds, on an average in equal numbers, each kind bearing only one of the two contrasted or alternative characters, which, as has been noticed, do not blend. [It is unnecessary to go into the detail that what the germ-cells bear is not so much the character as the determiner or factor of the character.] If 50 per cent. of the germ-cells (whether ova or sperms) bear the dominant character, and 50 per cent. bear the recessive character; then, if fertilisation be

fortuitous, 25 per cent. of the fertilised egg-cells will bear only the dominant character, 25 per cent. only the recessive character, and 50 per cent. will bear both the dominant and the recessive character (only the former being expressed in development). This is what is called *the theory of the segregation of pure gametes*, and it is the corner-stone of Mendelism.

Professor R. C. Punnett describes the characteristic Mendelian mode of inheritance in the following terms: 'Wherever there occurs a pair of differentiating characters, of which one is dominant to the other, three possibilities exist: there are recessives which always breed true to the recessive character; there are dominants which breed true to the dominant character and are therefore pure; and, thirdly, there are dominants which may be called impure, and which on self-fertilisation (or inbreeding, where the sexes are separate) give both dominant and recessive forms in the fixed proportion of three of the former to one of the latter. Bringing the theoretical interpretation into prominence—that is, the theory of gametic segregation—Professor Bateson says: 'The essential part of the discovery is the evidence that the germ-cells or gametes produced by cross-bred organisms may in respect of given characters be of the pure parental types, and consequently incapable of transmitting the opposite character; that when such similar gametes of opposite sexes are united in fertilisation, the individuals so formed and their posterity are free from all taint of the cross; that there may be, in short, perfect or almost perfect discontinuity between these germs in respect of one of each pair of opposite characters.'

In the course of further research some modifications have been made on the original statement of Mendelism. Thus the *complete* dominance which Mendel observed has been shown in some cases to be the exception rather than the rule. A cross between a 'Chinese' Primula with wavy crenated petals and a star Primula with flat, simply notched petals is intermediate between the two parents; and yet, as the next generation shows, the case is one of Mendelian inheritance. When white (dominant) Leghorn poultry are crossed with brown (recessive) Leghorn, most of the offspring have some 'ticks' of colour. When these are inbred they produce a quarter brown and three-quarters pure white, or white with a few ticks. The dominance is not quite perfect.

Again, one of the root-ideas of Mendelism is that the inheritance includes numerous distinct and independently heritable unit-factors, which give rise to definite clear-cut characters; these are often represented in related forms by analogous but contrasted characters ('allelomorphs'); and Mendel's theory was that only one member of any one pair of contrasted characters can be carried by one germ-cell. In this connection, Bateson has proposed a modification of the Mendelian conception which may be called 'the presence and absence theory.' 'It is possible to express all Mendelian phenomena in terms of a simpler system, according to which the allelomorphism may be represented as consisting essentially, not in the presence of separate factors for the dominant and for the recessive characters, but in the *presence* of something constituting the dominant character which is *absent* from the recessive gametes.' A black guinea-pig is dominant over an albino guinea-pig, all the offspring being black; it is probable that this should be expressed by saying (with Castle) that 'a distinctive *something* of the black parent dominates a corresponding *nothing* of the white parent.' Of course the facts of Mendelian inheritance remain secure however they may be formulated or inter-

preted. The results of Mendelian experiment have made it plain that many different kinds of organisms have clear-cut, we may almost say crisp, unit-characters which behave in inheritance as if they were independent constituents, being transmissible *en bloc* and in their entirety—not blending with analogous characters, but remaining quite distinct, and developing with intactness and exclusiveness or not at all. The Mendelian facts, as Bateson says, lead us to regard the organism as a complex of characters, of which some at least are dissociable, and are capable of being replaced by others like radicles in chemical combinations. This view is not inconsistent with, but rather corroborates, Weismann's picture of an inheritance as composed of numerous sets of determinants or primary constituents, each corresponding to an independently variable and independently heritable structure. Nor is it inconsistent with there being other characters which do not illustrate the Mendelian mode of inheritance, but form blends and intermediates. As Mendel's discovery is extended, it is bound to have a great influence on the breeding of animals and the cultivation of plants, in so far as these exhibit Mendelian characters. Wherever it is applicable it affords a solid basis for action, enabling the breeder to reach his desired result more surely, more rapidly, and more economically. It shows how to get a stable and pure strain in the quickest way, and how to transplant a character from one stock to another. Little is known as yet regarding Mendelian inheritance in man, but some abnormal characters, such as 'brachydactyly' (where the fingers are all thumbs) and 'night-blindness' seem to illustrate it.

Statistical Results.—Complementary to the experimental results—though not always in obvious harmony with them—are those reached by the application of statistical methods to facts of inheritance. Thus there is Galton's 'Law of Filial Regression,' which expresses the tendency of offspring to approximate to the average of their stock, and depends on the fact that the organism inherits from its ancestors as well as from its parents. An illustration given by Professor Karl Pearson will make the idea clear: 'Fathers of a given height have not sons all of a given height, but an array of sons of a mean height different from that of the father, and nearer to the mean height of sons in general. Thus, take fathers of stature 72 inches, the mean height of their sons is 70.8 inches, or we have a regression towards the mean of the general population. On the other hand, fathers with a mean height of 66 inches give a group of sons of mean height 68.3, or they have progressed towards the mean of the general population of sons. The father with a great excess of the character contributes sons with an excess, but a less excess of it; the father with a great defect of the character contributes sons with a defect, but less defect of it.' As Galton put it, 'However paradoxical it may appear at first sight, it is theoretically a necessary fact, and one that is clearly confirmed by observation, that the stature of the adult offspring must on the whole be more mediocre than the stature of their parents—that is to say, more near to the median stature of the general population.' Or again, 'Each peculiarity in a man is shared by his kinsmen, but *on the average* in a less degree. It is reduced to a definite fraction of its amount, quite independently of what its amount might be. The fraction differs in different orders of kinship, becoming smaller as they are more remote.' Yet it must not be supposed that the value of a good stock is denied or underestimated by Galton, for he shows how the offspring of two ordinary members of a gifted stock will not regress like the offspring of a couple equal in gifts to the former, but belonging to a poor stock, above the average of which they have risen, Yet

it is true that the fact of regression tells against the full hereditary transmission of any signal talent. Children are not likely to differ from mediocrity so widely as their parents. 'The more bountifully a parent is gifted by nature, the more rare will be his good fortune if he begets a son who is as richly endowed as himself, and still more so if he has a son who is endowed more largely.' The other aspect of the case must not, however, be overlooked. 'The law,' Galton says, 'is even-handed; it levies an equal succession-tax on the transmission of badness and of goodness. If it discourages the extravagant hopes of a gifted parent that his children will inherit all his powers, it no less discourages extravagant fears that they will inherit all his weakness and disease.'

It was from data in regard to human stature and as to coat-colour in Basset hounds that Galton reached the generalisation which he called the 'Law of Ancestral Inheritance.' 'The two parents between them contribute on the average one-half of each inherited faculty, each of them contributing one quarter of it. The four grandparents contribute between them one-quarter, or each of them one-sixteenth, and so on, the sum of the series $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \dots$ being equal to 1, as it should be. It is a property of this infinite series: that each term is equal to the sum of all those that follow: thus $\frac{1}{2} = \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \dots$; $\frac{1}{4} = \frac{1}{8} + \frac{1}{16} + \dots$, and so on. The prepotencies or sub-potencies of particular ancestors, in any given pedigree, are eliminated by a law that deals only with average contributions, and the varying prepotencies of sex in respect to different qualities are also presumably eliminated.' The general idea of this law is that the characters (or certain characters) of the offspring are correlated not only with those of the parents, but with those of the grandparents, great-grandparents, and so on, as well. Two points must be recognised: that it is a statistical conclusion, dealing with what is true on an average in a large number of cases; and that it is quite legitimate to accept the general idea without accepting the fixity of the fractions. Thus Pearson has found that the average ancestral contributions are more accurately represented by the series 0.6244, 0.1988, 0.0630, &c. than by Galton's series. It may be added that the application of statistical methods by Pearson and his school to such problems as the inheritance of fertility and longevity has yielded very important results.

Transmission of Acquired Characters.—The term 'acquired characters' is a technical one, which might be profitably replaced by 'somatic modifications.' It refers not to characters which blossom out from within in the individual lifetime under the influence of appropriate liberating stimuli, but to characters which are impressed from without by peculiarities of 'nurture' in the wide sense. They may be defined as structural changes in the body of the individual directly induced by changes in function or in environment, which transcend the limit of organic elasticity and persist after the inducing conditions have ceased to operate. 'Tanning' of the skin as the result of exposure, the formation of a callosity by pressure, the reduction of a muscle by disuse, the loss of pigment in darkness, are simple illustrations of somatic modifications. Their transmissibility was assumed by Lamarck and others; destructive criticism of this assumption is particularly associated with the work of Weismann.

These somatic modifications are often important for the individual; they may have through the body a secondary effect on the offspring (especially in the case of mammalian mothers); they may have an indirect importance in evolution by serving as individually acquired screens until coincident germinal variations in the same direction have time

to emerge and establish themselves; and they may serve, as Tower's experiments on potato-beetles strongly suggest, as variational stimuli, saturating through the body and provoking the germ-plasm to change. But the precise point at issue is this: Does a structural change in a part of the body, induced by use or by disuse, or by change in surroundings and nurture generally, ever influence the germ-plasm in the reproductive organs in such a specific or representative way that the offspring will thereby exhibit the same modification that the parent acquired, or even a tendency towards it? It does not seem to be possible at present to answer this question in the affirmative.

While there seems no secure warrant at present for believing in the transmission of somatic modifications, that should not lessen our appreciation of the importance of 'nurture.' It must be remembered that every inheritance requires an appropriate nurture if it is to realise itself in development; that modifications may secondarily affect the offspring especially in the case of mammals; that if what is acquired be not transmitted, what is not transmitted may be reacquired; and that man has developed around him an external heritage, a social framework of customs and traditions, of laws and institutions, of literature and art, by which may be brought about results even more effective than those which would ensue if there were an organic entail of modifications.

Heredity and Disease.—From the biologist's point of view, diseases are of two sorts: (1) abnormal or deranged processes which have their roots in germinal peculiarities (variations, to start with), which express themselves in the body to a greater or less extent according to the conditions of nurture; or (2) they are abnormal or deranged processes which have been directly induced in the body by acquired modifications—i.e. as the results of unnatural surroundings or habits, including the intrusion of parasites. There is no proof that this second kind of disease is heritable as such, though its indirect effects may influence the offspring, in the case of mammals at least. And when it is understood (1) that pre-natal infection is not inheritance, (2) that inheritance of a predisposition to a disease is not inheritance of the disease, and (3) that the general weakening of the offspring through disease in the parent is a very different matter from the transmission of a specific disease, it becomes evident that there is great need for caution in speaking of 'hereditary diseases.' In many cases what is inherited seems to be some general peculiarity or predisposition, which finds this or that expression in relation to the conditions of the body—a very variable soil, and in relation to the conditions of life—such as climate and diet. That grave defectiveness or unsoundness is often inherited must be admitted by all, and it seems also certain that this may be intensified and antedated in its expression in successive generations. Thus a mentally degenerate stock may show earlier and earlier collapse. The theory of this anticipation and intensification of disease is uncertain, but its practical importance is plain—it works towards the elimination of unfitness. The diseased condition is pushed farther and farther back, even to birth, or even before it! It is an undoubted fact that weakness and defects—it may be more definite predispositions to disease—often form part of man's natural inheritance. On the other hand, there are counteractives. Acquired diseases are not as such transmissible. The resisting power to microbic disease may be hereditarily below par, but it can be increased by nurture, a beneficial change in nurture may leave a predisposition latent. The risks of infection or of fatal infection are always being lessened by the progress of hygiene and

preventive medicine. In some cases it may be that constitutional immunity is in process of evolution. Just as a highly advantageous variation sometimes drops out, so it may be with one that is highly disadvantageous. By Mendelian methods it may be possible 'to get a pure thing out of an impure.' Nor must it be forgotten that in spite of man's efforts some wholesome natural selection still continues. Perhaps, with increase of knowledge, the possibilities of positive Eugenics may increase, and already three rules are clear—that, other things equal, the best general constitutions should be mated, that a markedly good constitution should not be paired with a markedly bad one, and that a person with a hereditary bias towards a specific disease should not marry another with the same bias. The progress that has been made, even since the beginning of the 20th century, in the discovery of the facts and the laws of heredity—or of genetics, as some would say—gives confidence to the view that the scientific foundations are gradually becoming secure enough and broad enough to serve as a basis for practical applications—and that not merely in farm and garden and breeding-pen, but within the sphere of human life. There is arising a hopeful new study of what Sir Francis Galton called Eugenics (q.v.), 'the study of agencies under social control that may improve or impair the racial qualities of future generations either physically or mentally.'

Hereford, the county town of Herefordshire, on the left bank of the Wye, 144 miles by rail WNW. of London, and 51 S. of Shrewsbury. Its noble cathedral was built between 1079 and 1535, and so exhibits every variety of style from Norman to Perpendicular. Measuring 342 feet by 146 across the transept, it has a central tower 165 feet high. It suffered much at Wyatt's hands after the fall of the western tower in 1786, but has been judiciously restored by Cottingham (1841-52) and Sir G. G. Scott (1856-63). Special features are the elaborate metal-work screen, the shrine of St Thomas de Cantilupe (1282), the organ (originally by Renatus Harris), and the 'Mappa Mundi,' or map of the world (c. 1314), a fac-simile of which was published in 1872. Hereford, with Gloucester and Worcester, is one of the meeting-places of the 'Three Choirs.' Other edifices are the Doric shire hall (1817), in front of it a statue (1864) of Sir G. C. Lewis; the corn exchange (1858), the episcopal palace (formed out of a Norman hall), the college of vicars choral (c. 1474), the 14th-century grammar-school, the half-timbered 'Old House,' the guildhall, the butchers' guildhall, the Coningsby Hospital (1610),

the free library (1876), &c. The Nelson column (1807) marks the site of the almost obliterated castle; and the White Cross, one mile out on the Hay road, commemorates the Black Death of 1347. Nell Gwynn and Garrick were natives. A large trade is done in agricultural produce; and the rose-gardens of Hereford are famous. The seat of a bishopric from 676, the city was chartered by Henry III., and returned two members to parliament from Edward I.'s reign till 1885, and one till 1918. It has stood many sieges from Stephen's time down to the Great Rebellion. At Kenchester, near Hereford, a Roman city was excavated in 1913. Pop. (1851) 12,108; (1881) 19,822; (1921) 23,324. See works by Britton (1831) and Havergal (1869); and Bannister, *Cathedral Church of Hereford* (1924).

Herefordshire, an inland county in the west of England, is bounded on the N. by Shropshire, E. by Worcester, S. by Gloucester and Monmouth, and W. by South Wales. In length it measures 38 miles, in breadth 35, and its area is 842 sq. m. Pop. (1801) 89,191; (1871) 125,370; (1881) 121,062; (1921) 113,118. The surface is mostly hilly, with occasional valleys opening into widespread plains, the chief hill-ranges being those of the Hatterell or Black Mountains (2631 feet) on the south-western, and the Malvern Hills (1395) on the eastern boundary of the county. It is watered by several streams, the principal of which are the Teme, and the Wye with its affluents the Lugg, the Arrow, and the Monnow, alike noted for their fishing, and the Wye in particular for its picturesque scenery. The climate of Herefordshire varies with the elevation and exposure, but, as attested by the general longevity of the inhabitants, is on the whole very healthy. The soil, which is for the most part a deep, heavy, red loam, with a substratum in many places of limestone, produces good crops of grain, principally wheat, and is favourable to the growth of timber. Hops are largely cultivated, and a great part of the area of the county is given to orchards. Herefordshire is celebrated for its cattle, and its horses and sheep are in a lesser degree well known. Cider-making is the principal manufacture, and malting is also carried on; whilst sandstone, limestone, and marble have been largely quarried. The county (since 1918) returns two members to parliament, one for each of its two divisions (Leominster and Hereford). The principal towns are Hereford, Leominster, Ross, and Ledbury.

The historical events connected with the county are soon told. Its earliest inhabitants were the Silures, who for long withstood an invasion of the Romans, but, being at last (about 73 A.D.) overcome, they retired into the fastnesses of Wales. During the so-called Heptarchy it was incorporated with Mercia, and subsequently from its position on the Welsh border was—a portion of the county being included in the debateable land called 'the Marches'—the scene of prolonged contests between the rival claimants. In 793 A.D. Ethelbert, king of the East Angles, was treacherously murdered at Sutton, near Hereford; and in 1461 at Mortimer's Cross, 4 miles north-west of Leominster, the decisive battle took place between the houses of York and Lancaster which resulted in the defeat of the latter and the establishment of Edward IV. on the throne of England. Subsequently Herefordshire suffered much during the civil broils in the time of Charles II. Of places of interest in the county mention may be made of Offa's Dyke (q.v.); of Dorstone, where there is a large and curious cromlech known as 'Arthur's Stone'; of the ruins of Clifford Castle, the birth-place of 'Fair Rosamond,' Henry II.'s mistress; and of the Hereford Beacon on the Malvern Hills, on which is a camp, the construction of which is ascribed to Caractacus. Robert Devereux, Earl

of Essex (Queen Elizabeth's favourite); Richard Whittington, 'thrice Lord Mayor of London'; David Garrick, the actor; John Kyrie ('The Man of Ross'); and Nell Gwynn, the favourite of Charles II., were all natives of Herefordshire; and Mrs Browning, the poetess, passed her childhood there. See the 'Victoria County History' (1908 *et seq.*), and A. G. Bradley, *Shropshire, Herefordshire, and Monmouth* (1908). For the Earls of Hereford, see BOHUN.

Herencia, a town of Spain, 40 miles NE. of Ciudad Real, manufactures soap; pop. 8400.

Hereros. See DAMARALAND.

Heresy (Gr. *hairesis*) primitively means a choice or election, and in its application to religious belief is used to designate as well the act of choosing for one's self, and maintaining opinions contrary to the authorised teaching of the religious community to which one's obedience is due, as also the heterodox opinions thus adopted and the party which may have adopted them. In the Acts of the Apostles (see v. 17, xv. 5, xxiv. 5, xxviii. 22) the word seems to be used of a sect or party, apart from the consideration of its character, whether good or bad; but in the Epistles and in the early Christian writers it is almost invariably used in a bad sense, which is the sense uniformly accepted in all subsequent theological literature. Roman Catholic writers, regarding the authority of their own church as supreme and final, apply the name of heresy to any formal denial of a doctrine proposed by the Roman Catholic Church as necessary to be believed. Protestant writers seldom use the word, except in relation to what each sect regards as the essentials of Christian faith.

Even in the apostolic times heresies had arisen in the church, and before the Council of Nice the catalogue of sects had already swelled to considerable dimensions. The chief early heresies are reducible to two classes: (1) those which attempted to associate the Christian doctrines with Judaism; (2) those which ingrafted Christianity upon the Gentile religions or the Gentile philosophies.

From the very date of the establishment of Christianity in the Roman empire heresy appears to have been regarded as a crime cognisable by the civil law; and Constantine enacted several severe laws for its repression, which were continued and extended by his successors, and were collected into a single title, *De Hæreticis*, in the Justinian code. The penalties of heresy ordained by these enactments are very severe, extending to corporal punishment, and even to death; and they all proceed on the distinct assumption that a crime against religion is a crime against the state. These enactments of the Roman law were embodied in the various codes of the European kingdoms; in English law heresy consisted in holding opinions contrary to Catholic faith and the determination of Holy Church. By common law the offender was to be tried in the provincial synod by the archbishop and his council, and, after conviction, was to be given up to the king to be dealt with at his pleasure. But the statute 2 Hen. IV. (*De hæretico comburendo*; 1401) empowered the diocesan to take cognisance of heresy, and, on conviction, to hand over the criminal directly, and without waiting for the king's writ, to the sheriff or other competent officer. This statute continued practically in force, with certain modifications, till the 29 Charles II. chap. 9, since which time heresy is left entirely to the cognisance of the ecclesiastical courts. The article BLASPHEMY deals with an important cognate subject.

In the case of clergy of the Church of England, under a statute of 1571 (now confined to its narrowest effect by a series of judgments) any distinct contradiction of the Articles, or obvious evasion of

them, subjects the offender to deprivation of his benefice. The supreme authority is the Judicial Committee of the Privy-council, which construes the articles and formularies according to the legal rules for the interpretation of statutes (see ECCLESIASTICAL COURTS; and ENGLAND, CHURCH OF). In the Presbyterian churches a heretical minister is usually tried by his presbytery, and may be deposed from the ministry by the General Assembly.

For the history and literature of heretical sects, see articles ALBIGENSES, ARIUS, EBIONITES, ESENESES, GNOSTICISM, MANICHÆUS, MONTANISM, MYSTICISM, PELAGIUS, &c. See also the articles BAUR, CHURCH HISTORY, DOMINICANS, EXCOMMUNICATION, INQUISITION, PERSECUTION; histories of doctrine by Thomasius (1874-76), Neander (Eng. tr. 1882), Harnack (Eng. tr. 1894-99), Seeberg (1895-98), Loofs (1906), and Rinn (1910); Arnold's *Ketzergeschichte* (1699); Hahn's *Ketzer im Mittelalter* (1850); and Hilgenfeld's *Ketzergeschichte des Urchristentums* (1883).

Hereward, commonly called HERWARD THE WAKE, was an English yeoman or squire who held the Isle of Ely against William the Conqueror in 1070-71. When William had succeeded in encompassing the English patriots and penetrating to their camp of refuge, Hereward, scorning to yield, cut his way through to the fastnesses of the swampy fens northwards. It is probable that he subsequently became reconciled to William. He held property in Warwickshire and probably also in Worcestershire. The noble lineage assigned to Hereward in Charles Kingsley's romance of *Hereward the Wake* (1866) has been shown by Freeman (*Norman Conquest*, vol. iv.) to be destitute of historic foundation.

Herford, a town in the Prussian province of Westphalia, situated close to the frontier of Lippe-Detmold, 59 miles SW. of Hanover by rail. Flax and cotton spinning, linen-weaving, and the manufacture of sugar and confections are carried on. Pop. 35,000.

Hergest, THE RED BOOK OF, the name usually given to a great manuscript, the chief repository of Welsh literature, now preserved in the library of Jesus College, Oxford. It owes its name to Hergest Court, a seat of the Vaughans, for whom most likely it was originally compiled. It is a folio volume of 360 vellum leaves written in double columns, from the beginning of the 14th to the middle of the 15th century. Its eleven prose tales were printed and translated by Lady Charlotte Guest, together with the romance of the *Hanes Taliesin*, under the name of *Mabinogion* (3 vols. 1838-49; new ed. by Nutt, 1904).

Heriot, in English law, is a kind of fine due to the lord of a manor on the death of a person holding land of the manor, and consists of the best beast, jewel, or chattel that belonged to the deceased. The lord can enforce this right by action, or seize it *brevis manu*. Heriots probably originated in the return of the horse and arms lent by a feudal lord to his tenant; they are now seldom paid in respect of freehold lands, and they are regarded as one of the most vexatious incidents of copyhold tenure. See COPYHOLD.

Heriot, GEORGE, founder of a magnificent school at Edinburgh, was a descendant of the Heriots of Traboun, East Lothian, and was born at Edinburgh in June 1563. Commencing business as a goldsmith in that city in 1586, he was, after being eleven years in business, appointed goldsmith to Anne of Denmark, consort of James VI. of Scotland, and soon after to the king. On James's accession, in 1603, to the English throne, Heriot went to London, where, as court-jeweller and banker, he amassed considerable riches. He died at London, February 12, 1624, without issue, and bequeathed the residue of his property, amounting to £23,625,

to found and endow a hospital (or school) in Edinburgh for the maintenance and education of the sons of poor deceased or decayed burghers. Heriot's Hospital was completed from a design, it is believed, by Inigo Jones, in 1659. In 1837 an act of parliament was procured for expending surplus funds which had accumulated in the hands of the trustees in the erection of free schools for poor children (ultimately sixteen in all). The Act of 1885, at which time the annual revenue of the trust amounted to £26,502, reconstituted the hospital as a middle-class and technical school, and closed the free schools in the city. The Heriot-Watt College was also subsidised from the Heriot funds, to provide for older students thorough scientific and technical instruction at moderate fees. Besides, there are valuable bursaries awarded for the promotion of secondary and higher education, tenable at George Heriot's Hospital School, the High School, the Heriot-Watt College, and the university, as well as travelling scholarships. 'Jingling Geordie' figures in Scott's *Fortunes of Nigel*. See *History of Heriot's Hospital*, by W. Steven (new ed. 1859).

Heri-Rud. See HARI-RUD.

Herisau, the largest town of the Swiss canton of Appenzell, in the Auser Roden division, stands 2549 feet above sea-level, $5\frac{1}{2}$ miles SW. of St Gall by rail. It is a thriving seat of the cotton manufactures. Pop. 15,000.

Heristal, or HERSTAL, an industrial town of Belgium, on the Meuse, immediately NE. of Liège, of which it is virtually a suburb. It is mostly inhabited by workmen, who find employment in the coal-mines and the iron and steel works. Ruins still exist of the castle of Heristal, the birthplace of Pepin, the mayor of the palace; and his great-grandson Charlemagne frequently resided here. Pop. 23,000.

Heritable and Moveable, a Scots law phrase denoting the distinction of things which go to the heir and to the executors respectively. Moveables include such property as passes to the executor in succession, or is removable by the tenant on leaving his farm, or as comes under the operation of the law of the owner's domicile in bankruptcy and succession. Money and household furniture may be taken as examples. Heritable subjects are such as go to the heir in succession, or go with land to a buyer, and are regulated by the territorial law. The best examples are land and houses. The gearing of engines and all machinery fixed to the floor are also heritable. The distinction corresponds to a certain extent to the phrase 'Heir and Executor' in England.

HERITABLE BOND, in Scots law, is a personal bond for a sum of money, with a real right of annual rent payable out of land, and accompanied by a conveyance of the lands themselves in security. The usual deed is now a bond and disposition in security, corresponding to the English Mortgage (q.v.).

HERITABLE SECURITIES, the name given in the law of Scotland to what are called mortgages and charges on land in England. These were formerly distinguished into wadset, infefment of annual rent, heritable bond, bond and disposition in security, and absolute disposition with back-bond, and also reserved burdens on land. By the constitution of a heritable security the debt secured becomes a burden on the land, entitling the creditor to appropriate the rents until the debt is paid. This right of the creditor remains entire against the land, no matter into whose hands it passes, and without affecting or being affected by the feudal titles, which confer and transmit the radical right to the land. In Scotland the principal

heritable security is now called the bond and disposition in security, which consists of an obligation to pay the debt, and a disposition to the creditor, by way of security till the debt is paid. The bond must be registered in the Register of Sasines to complete the creditor's title, and it is assignable to a third party. A power is always given to the creditor to sell the estate if the principal or interest is not paid, in which case the creditor must account for the surplus after paying himself his debt.

Heritable Jurisdictions, a remarkable class of jurisdictions held hereditarily from the crown in Scotland, and abolished in 1748. These jurisdictions amounted to upwards of a hundred in number, and consisted of sheriffships, stewardries, constabularies, but principally of regalities and baileries, with some offices of distinction. One of the more important was the office of Lord Justice-general and the lordship of Argyll and the Isles, both belonging to the family of Argyll. In virtue of their hereditary rights, the possessors of these jurisdictions exercised an arbitrary power over vassals and others within the limits of their domain, and could punish them by fines, scourging, imprisonment, and even in some cases put them to death, without interference of the common law. As repugnant to social policy, and more particularly with the view of extinguishing the authority of Highland chiefs over their clans, these heritable jurisdictions were abolished; the possessors receiving payment for the assumed value of their rights. Argyll alone received £21,000 as an indemnity, and altogether there was paid by government £152,037, 12s. 2d. The abolition of these odious jurisdictions being followed by the appointment of sheriffs on a proper footing, this great legislative act marks an important era in the history of Scotland. See the Duke of Argyll's *Scotland as it was and as it is* (1887).

Heritor, in the law of Scotland, is the owner of land in a parish liable to public burdens. The heritors, collectively, have vested in them the fee of the church and churchyard; they repair the parish church and manse, or rebuild them where necessary, and before the Education Act (1872) elected the parish schoolmaster.

Her'komer, SIR HUBERT VON (1849-1914), born at Waal, in Bavaria, was the son of a wood-carver who came to England in 1857. At the age of thirteen he gained a medal at the Southampton art school, and afterwards studied for a few months at Munich and South Kensington. In 1870 he settled in London, where, besides painting, he employed himself in preparing designs for the *Graphic*. In 1879 he was elected A.R.A., in 1885-94 was Slade professor at Oxford, became R.A. in 1890, and was knighted in 1907. His best work is in his portraits, as 'Miss Grant,' 'The Lady in White,' 'Tennyson,' and 'Herbert Spencer.' An engraver, wood-carver, playwright, and musician, he was founder and director of an art-school at Bushey (q.v.), and was much interested in 'colour-music,' in which a succession of colours produced by means of a keyboard took the place of musical sound. He wrote *The Herkomers* (1910-11). See Life by J. Saxon Mills (1923).

Herkulesbad (or *Mehadia*), a Rumanian watering-place, 20 miles north of Orsova by rail; its eighteen warm springs, 'the waters of Hercules,' have been used since Roman times.

Hermæ. See HERMES, ALCIABIADÉS.

Herman, MARTIAL JOSEPH ARMAND (1749-95), born at St Pol, was a lawyer, and, intimate with Robespierre, was in 1793 made president of the Revolutionary Tribunal which tried Marie Antoinette and Danton. As minister of justice he was

responsible for many judicial murders, but, accused of receiving bribes from Robespierre and of complicity with Fouquier-Tinville, was himself guillotined.

Hermadad, THE (Sp., 'brotherhood'), had its rise in an association of the principal cities of Castile against the nobles who in 1282, under Prince Sancho, rose against Alfonso X. When Sancho succeeded to the throne (1295) the league was more firmly organised throughout Castile and Leon, with the express object of resisting the tyranny and exactions of the crown-vassals and nobles. Ferdinand and Isabella, in order to curb the power of their feudatories, first favoured the association, and ultimately (in 1485) gave it a legal status under the name of the *Hermadad*. It now constituted a confederation of the entire burgher class for police and judicial purposes, with local courts and an annual meeting of deputies from all the cities; and the sovereigns, adopting its members as a standing force to counterbalance the followers of the feudal lords, put themselves at the head of the association, and placing it at the service of the city magistrates, employed it both in quelling disturbances and in seizing confiscated properties. The introduction of a regular standing army enabled the crown to free itself from this dependence on the towns; and with the decay of the *Hermadad* disappeared the last vestige of popular freedom.

Hermann, JOHANN GOTTFRIED JAKOB, classical scholar, was born at Leipzig, 28th November 1772, studied there and at Jena, and from 1798 till his death, 31st December 1848, was professor at Leipzig, holding in succession chairs of philosophy, rhetoric, and poetry. He attempted to base a science of classical metre on the categories of Kant, and wrote in this connection both German and Latin treatises on the rules and principles of metre. Of wider importance, however, was the new method which he introduced into the treatment of Greek grammar, and which has had its influence on the grammar of Latin and of German. The principles of this method are explicitly developed in *De Emendanda Ratione Græcæ Grammaticæ* (1801), and are practically illustrated in his numerous excellent editions of the ancient classics. Hermann's power of dealing with chronological, topographical, and personal questions is shown in his *Opuscula* (8 vols. 1827-77), which also contain some poems breathing the spirit of Roman poetry. See *Memoirs* by Jahn (1849) and Köchly (1874).

Hermannstadt (Lat. *Cibinium*, Rum. *Sibiu*, Hung. *Nagy-Szeben*), a town of Rumania, formerly capital of Transylvania, is 72 miles SSE. of Klausenburg. It consists of an upper and a lower town, the walls, towers, and bastions formerly surrounding which have been demolished. Hermannstadt is the seat of a Rumanian Orthodox archbishop. There are many colleges and schools. The fine Bruckenthal palace contains a picture-gallery, numismatic, antiquarian, and mineral collections, and a library. Tanning, wax-bleaching, and the making of cloth, paper, candles, sugar, and hats are carried on. Pop. 34,000, three-fourths Germans. Hermannstadt was originally the seat of a German colony, founded in the reign of Gesa II. (1141-61), and was at first called *Villa Hermannii*. It has endured several sieges from the Turks (1438 and 1442), as well as one from the followers of John Zapolya (1526). It also suffered at the hands of Gabriel Bathori in 1610, and again from both combatants during the Russo-Hungarian war of 1849.

Hermaphroditism, the combination of the essential male and female functions and structures in one organism, as in most flowering plants, or in many lower animals, such as earthworm, leech, or snail. The name is derived from the fable of the

union into one of the bodies of Hermaphroditus, son of Hermes and Aphrodite, and the nymph Salmacis (see Ovid's *Metamorphoses*, iv. 347). The combination of two sexes occurs, however, in various degrees, the bisexuality being sometimes intimate, and in other cases superficial. (a) Some animals, e.g. frogs, according to certain authorities, which are unisexual in adult life, pass through a period of larval hermaphroditism, followed by the more or less complete predominance of one sex over the other. (b) Among fishes and amphibians and elsewhere, *casual* or *abnormal* hermaphroditism is not infrequent, the animal having, for instance, an ovary on one side and a testis on the other. (c) In other cases only one organ is developed, but there are hints of the other. Thus the toad has in both sexes a puzzling organ called 'Bidder's organ,' which seems to be a rudimentary ovary. It disappears in mature females, where the true ovary is fully developed; it persists in the males, at the anterior end of the testis. (d) In some of the higher animals there is what is badly called 'false hermaphroditism,' where the essential reproductive organs (ovary or testis) are quite normal, but there is in the accessory genital structure some hint of the opposite sex.

(e) *Normal adult hermaphroditism*, where egg-producing and sperm-producing functions go on (usually at different times), is rare among higher animals—occurring in Chrysophrys and Serianus among fishes, in the hagfish *Myxine*, and in all the Tunicata. It is, however, of frequent occurrence in the invertebrate series—among snails, bivalves, cirripedes, worm-types, coelenterates, and sponges. It is common, in a sense, in flowering plants; but, strictly speaking, stamens and carpels produce two different kinds of spores.

Hermaphroditism may be more or less intimate. Thus, as an entire plant an *Arum* is hermaphrodite, with female flowers below and male flowers above; but the hermaphroditism is more intimate in a buttercup, where each flower bears male and female organs, or yet more intimate in an orchid, where stamens and carpels are united. So a leech, with ovaries quite distinct from the testes, is less intimately hermaphrodite than a snail, where within the same small organ both kinds of sex elements are produced.

The male and female elements, whether in phanerogam or invertebrate, are rarely, if ever, matured at the same time. Such a 'want of time-keeping' is called in botanical language dichogamy, and is one of the conditions which tend to prevent self-fertilisation. Protandrous dichogamy, where the stamens take the lead, is much commoner than protogynous dichogamy, where the carpels mature first. This is also true of animals, and is more marked when the hermaphroditism is intimate, as in snail or oyster. The hagfish seems to be predominantly male till it attains a certain size; and so in the curious thread-worm *Angiostomum* and in the crustacean *Cymothoides* the organs are first male and then after a while female. In the cirripedes and Myzostomata, the majority of which are bisexual, pigmy or complementary males are in some cases associated with the hermaphrodites.

Alike in plants and in animals, though hermaphroditism is common, self-fertilisation is rare. It does occur in not a few common flowers, and in tapeworms, some flukes, and a few other animals, but is without doubt exceptional.

Hermaphroditism is commonest in sluggish animals (e.g. snails), or in fixed animals (e.g. Tunicates), or in parasitic animals (e.g. flukes and tapeworms).

As to its origin, hermaphroditism is regarded by some as the more primitive condition from which

unisexuality has been in the majority of cases evolved. In alternating rhythms eggs and sperms were produced, gradually the areas of their respective formation were restricted, by-and-by one tendency predominated in the organism, and separate males and females were established. On this view a hermaphrodite organism is regarded as remaining in that respect in a primitive condition. In some other cases, e.g. cirripedes, it seems not unlikely that a secondary hermaphroditism has arisen by the addition of a female function to a male organism.

See EMBRYOLOGY, HEREDITY, MONSTER, REPRODUCTION, SEX, and books there cited; and Geddes and Thomson, *The Evolution of Sex*. For aberrant hermaphroditism in human adults, see Schwalbe, *Morphologie der Missbildungen* (1906-9).

Hermas, as the author of the well-known early treatise called *The Shepherd*, is usually reckoned one of the Apostolic Fathers (q.v.). The work is quoted as inspired by Irenæus and Clement of Alexandria. To the Montanist Tertullian it is 'that apocryphal Shepherd of the adulterers;' but Ensebius, while he places it in his list of spurious or rejected books, witnesses that it had been read publicly in the churches. And indeed the 'commandments' were read here and there in the Eastern Church from the 4th to the 15th century, though nowhere with the honour of Scripture. The date and the authorship are both in dispute. The suggestion first advanced by Origen, in the 3d century, that the Hermas mentioned in Romans might be the author, may be dismissed in company with the assertion of the Ethiopic scribe that Hermas was none other than St Paul. The statement of the writer of the Muratorian Fragment has been generally accepted, that Hermas was the brother of Pius I., Bishop of Rome about the middle of the 2d century, and that he wrote during his brother's episcopate; but the form of church government that appears in *The Shepherd* is against this tradition, as perhaps is also the jealousy the writer displays of those who are ecclesiastically his superiors; and moreover the treatise was already in general use considerably before the end of the century. On account of these and other considerations there has arisen a tendency to throw the date back to the beginning of the 2d century, and to identify a certain Clement who is mentioned with Clement (q.v.) of Rome. This last point is a mere assumption, but in favour of the earlier date is most of the internal evidence, as well as the fact that the book was read in public—an honour restricted in every other instance to writings accepted as those of the Apostles or their immediate disciples; against it are the allusions to the persecutions suffered by the Christians, the condition of the Roman Church, and the absence of all reference to Judaizing Christians. Finally, Donaldson's theory that the name Hermas is fictitious, and the whole work an allegory, appears to be based on a misconception. The treatise, which is divided into three parts—visions, commandments, and similitudes—contains little of positive dogmatic teaching, but is an interesting monument of early Christian thought; it was intended primarily to rebuke the worldliness that had come upon the church, and to turn sinners to repentance.

Latin translations were in use before the end of the 2d century, and for long the work was known only through a score of MS. copies of one of these versions. A second Latin version has been discovered, however, as well as an Ethiopic version, found by D'Abbadie in 1847, and edited by him with a Latin translation (Leip. 1860). Of the Greek text the Codex Sinaiticus supplies about one-fourth, to nearly the end of the fourth commandment; the rest, except about seven short chapters, is in the Athos MS. Considerable portions are found in Pseudo-Athanasius and Antiochus Palæstinensis, who have borrowed exten-

sively from Hermas without acknowledgment. Some fragments of the text have been found in papyri. *The Shepherd* is among the books on which the forger Simonides exercised his craft. There is a 'complete' Greek text by Hilgenfeld (1888), who also edited the Latin form (1873); and a *Collation of the Athos Codex* by Lambros (trans. with preface, &c., 1888). There is a good edition of Latin and Greek by Gebhardt and Harnack (1877); an English translation by C. Taylor (2 vols. 1903-6). See also Zahn, *Der Hirt des Hermas* (1868); Donaldson, *The Apostolical Fathers* (1874); Salmon's *Introduction to N. T.*; Cruttwell's *Early Christianity* (1893); and a book on Hermas by Krüger (1897).

Hermeneutics. See EXEGESIS.

Hermes, on the testimony of art and literature alike, was more intimately connected with the everyday life of the Greeks than was any other of their gods. In the country his images were erected on mountains, in caves, by the side of streams, by the roadside, where they served as finger-posts, and on the marches, where they served to delimit the frontier. In towns the gate by which one entered the city and the door by which one entered a house were under the protection of an image of this deity. The streets of the city, like the roads of the country, were marked by statues of Hermes (Lat. *Hermes*). Inside the house as well as outside its doors the likeness of Hermes was to be found. The agora or market-place of every city was especially under the protection of this deity, and possessed a statue of him. The gymnasium and palaestra also were decorated with likenesses of their patron god Hermes. Finally, in the very grave the Greek was accompanied by Hermes, the conductor of souls.

From what has been said it is obvious that the functions ascribed to Hermes, the son of Zeus and Maia, must have been very considerable in number and range. In the first place, he was regarded unanimously and from the beginning as the herald and messenger of Zeus, and, in virtue of this character he is represented in art with the herald's staff, with wings on his feet or shoulders, and a traveller's hat of felt, low in the crown and broad in the brim, on his head. It seems natural in the next place to attribute Hermes' function as god of the training ground to the speed of foot which he as the herald of the gods was credited with. Again, Hermes was the patron of thieves, and he himself, according to the 'Hymn to Hermes,' commenced a thief's career by stealing the oxen of Apollo when he was but a few hours old. At the same early age, according to the same authority, Hermes invented the lyre, which he constructed out of the shell of a tortoise. The invention of the flute and the syrinx also was ascribed to this deity. The function of conducting the spirits of the departed to the next world, and the closely-related function of bringing dreams to mortals, probably were part of his duties as the messenger of the gods, but are of so much importance that they need separate mention. A function apparently quite unconnected with any already mentioned is that of securing fertility to flocks and herds, and generally of preserving health. We have already noticed that roads and streets in Greece were under the especial care of Hermes; we must then connect this fact with the circumstance that Hermes was the patron of travellers, merchants, and commerce generally. Finally, Hermes was the god of unexpected good-luck; what we call a godsend the Greeks called a *Hermaion*.

As to the origin of Hermes comparative mythologists are disagreed, though perhaps not more so in his case than in the case of other gods. He has been regarded as the god of fertilising rain, as the evening twilight or the light of dawn, as a cloud-god, as a nether-world god, and of course as a solar god. It is objected to these explanations that they

only account for some and not for all of his functions. Thus, the fertilising rain would explain his function of causing fertility (were it not for the fact that it is the fertility of flocks and herds that Hermes is concerned with), and the pleasant sound of the falling rain might explain his connection with music. But the other functions find no explanation or but a forced one in this theory. It has been therefore argued (by Roscher, *Hermes der Windgott*) that Hermes is a wind-god. The wind is the divine messenger sent from Zeus (the sky) to man. The wind sweeps down from the mountain-tops, where again the images of Hermes were placed. The swiftness of the wind is indicated by the wings on the heels or the shoulders of the god. The winds carry things away, even as the thief Hermes. The wind, like Hermes the inventor of the flute and the lyre, makes sweet music. Ghosts that are but thin air, belong to the domain of the air, and are under the dominion of the wind-god. The gentle zephyrs not only favour the growth of plants, but, according to ancient notions, conduced to the fertility of flocks and herds. The winds also blow away foul air and miasma, and the wind-god is therefore properly the god of health. The changing wind has ever been the symbol of fickle fortune and unexpected luck, and Hermes is the god of unexpected good-fortune. Travellers are especially dependent on wind and weather, and hence on Hermes. Again, various epithets which are applied to this god and have caused much trouble to scholars can be explained on this theory. *Argeiphontes* is the god who makes the sky clear, as does the wind. *Diaktoros* is the chaser.

That this explanation of the origin and functions of Hermes explains everything cannot be denied. Whether it is the right explanation is another matter. Apart from the fact that there are not many things for which an analogy could not be found in the action of the wind, it may be doubted, as a matter of general principle, whether we ought to look for one idea from which to deduce all the functions of a god. We may borrow an illustration from comparative syntax: no one would now think of trying to deduce all the meanings of the Greek genitive from one single central idea. In the first place, the Greek genitive conceals beneath it several cases (just as the Greek Heracles conceals several different local heroes), such as the ablative, the instrumental, &c.; and, in the next place, even the uses of the genitive proper were not as a matter of history all evolved out of one nebulous use equidistant from all subsequent uses. The extension of the meaning of a case, like the extension of the meaning of a word, is due to analogy, to its application to expressions new but analogous to those in which it was first employed. The same principle of extension by 'contiguity,' as logicians call it, in all probability explains the heterogeneous functions ascribed to any one particular god. To seek for some notion common to them all may be as mistaken a proceeding as it would be to seek to derive the idea of the grave and the idea of hoiseracing from some idea equidistant between the two, because 'the turf' bears both meanings.

Finally, the beauty which characterises the statue of Hermes in the zenith of Greek art naturally belongs to the patron god of the gymnasium and the palestra, while the celebrated statue of Hermes by Praxiteles portrays the god of the principle of fertility. The Romans identified Hermes with their own Mercurius, really a divinity of commerce and gain, and transferred the attributes of the former to the latter. For Hermes Trismegistus, see HERMETIC BOOKS.

Hermes, GEORG, a Roman Catholic philosopher and divine, was born at Dreyerwalde, in Westphalia, 22nd April 1775. He studied at Münster,

became theological professor there in 1807, and in 1819 at Bonn. At Bonn he died, May 26, 1831. In his chief works, *Die Innere Wahrheit des Christentums* (1805), *Philosophische Einleitung in die Christkatholische Theologie* (1819), and *Christkatholische Dogmatik*, he sought to base the Catholic faith and doctrines on a critical theory of knowledge like Kant's. The Hermesian method of investigation in like manner discards, in the first stages, and so far as investigation is permitted to extend, all principle of authority; and in the details of metaphysical inquiry, in the selection of the arguments of the existence of God, and of the nature of divine attributes, he departed widely from the old text-books of the schools; although in the general sum of the doctrines of the Roman Catholic Church his orthodoxy does not appear to have been in any degree called into question. Soon many theological and philosophical chairs were filled by *Hermesians*; and it was not till after the death of Hermes that his doctrines were condemned by the pope (1835), and some professors deprived of their chairs. The controversy was continued, as well in Rome as in Germany, for a considerable time; by degrees, however, the Hermesian party fell away.

See works by Esser (1832), Elvenich (1836), Niedner (1839), and Stapp (1845); and the article in the *Herzog-Hauck Realencyklopädie*.

Hermetic Books, a series of pseudepigraphic writings, reported by Clemens Alexandrinus to be 42 in number, and to constitute a complete canon of ancient Egyptian religion, arts, and science—the nature of the gods, laws, liturgical rites and ceremonies, hymns, hieroglyphics, geometry, astronomy, medicine, and cosmography. The name 'hermetic' comes from Hermes Trismegistus ('Hermes Thrice-greatest'), the Greek name of the Egyptian god Thoth, who was regarded as the originator of Egyptian culture, the god of writing, of religion, and of the arts and sciences. Neither the time at which these books were actually written, nor the author or authors who wrote them, can now be determined. They are evidently based upon the Egyptian mythology, but at a time when it was beginning to feel the influence of Hellenistic culture, since traces of Neoplatonist ideas can be discerned in them, as also indications of the influence of the Jewish philosopher Philo. The Greek and Latin texts of the hermetic books exist, but only fragmentarily, in the writings of such writers as Stobæus, Cyrillus, Suidas, and Lactantius. The greater part of these pieces have been published by Parthey (*Hermes Trismegisti Poemander*, 1854), and again by Ménard (*Hermes Trismégiste*, 1866). The *Papyrus Ebers* (1875) is generally accepted as being one of the medical books of the series. The teachings of Thoth were at first regarded as esoteric doctrines, and as such jealously guarded by the sages and from them transmitted to their pupils, these depositions of the sacred lore making what was called the *hermetic chain*. Thoth was also the inventor of magic and alchemy, whence the latter was sometimes called the *hermetic art*, and whence are derived the terms *hermetic medicine*, *hermetic freemasonry*, and *hermetically sealed*.

See Pietschmann, *Hermes Trismegistus* (1875), and the introduction and translation by Mead in his *Thrice Greatest Hermes* (1907).

Hermit (Gr. *eremites*), a name given in the early ages, and still more in the later church, to a solitary ascetic, who, with a view to more complete freedom from the cares, temptations, and business of the world, took up his abode in a natural cavern or a rudely-formed hut in a desert, forest, mountain, or other solitary place. In the first centuries the names of eremite and anchorite (Gr *anachō-*

erētes = 'one who retires'—i.e. from the world) were indiscriminately applied to these solitaries; but, the word *eremita* having been adopted into Latin, 'hermit' is more commonly used in the modern languages which are derived from that tongue. Hermits began to appear in the Christian church in the 3d century. The advocates of Asceticism (q.v.) were the first to set the example of retiring from cities to rural districts and villages. But the hermits went further, and sought to withdraw altogether from mankind, that they might give themselves up to a life of solitary but holy contemplation. The earliest hermit is said to have been Paul of the Thebaid (Egypt), who during the Decian persecution fled for safety to the desert (250); there he lived for the rest of his life, dying, 113 years old, about 342. The fame of his sanctity quickly incited others to imitate his mode of life. The most famous amongst these successors was St Anthony (q.v.). At the time of his death (365) hermit cells existed in considerable numbers in the deserts of Egypt, Syria, and Palestine. But the hermits were not always able to preserve their solitude unbroken. The fame of their sanctity drew many to visit them, partly out of curiosity, partly to enjoy pious converse with them, or to get religious advice from them, partly also in the belief that diseases, particularly mental diseases, were cured by their blessing. Sometimes they returned for a short time to the midst of their fellow-men to deliver warnings, instruction, or encouragement, and were received as if they had been inspired prophets or angels from heaven. The Stylites (q.v.) or pillar-hermits, who spent their lives on the tops of columns, and similar eccentric beings, were a base caricature of the true hermit, men in whom the good spirit of asceticism had become perverted by exaggerated fancy or pride or passion. But the number of hermits gradually diminished as the cenobite life of convents grew into fashion. Indeed the institution at no time secured the same footing in the Western Church that it did in the Eastern; and perhaps the reason may in part be found in the difference of climate, which renders a manner of life impossible in most parts of Europe that could be pursued for many years in Egypt or Syria. Partial revivals of the practice continued to be made, however, during some centuries, St Cuthbert (q.v.) being a case in point. The name hermit was in still later ages applied to those eccentric individuals who separated themselves from their fellow-men to live in caves or solitary huts, not from any religious motives, but from a morbid aversion to human society or love of solitude. See MONACHISM, and articles in the *Catholic Encyclopedia*, Herzog-Hauck, and Hastings.

Hermitage. See WINE.

Hermit-crab, a name applied to the members of a tribe of crustaceans (Paguridea), notable for their habit of sheltering themselves in gasteropod shells and the like, and for the soft-skinned and generally unsymmetrical tail. The eyes are borne on long stalks; the great claws are very large and generally unequal, the right one being used to close the entrance of the shell into which the hermit can wholly retract himself; the abdominal appendages are practically aborted, with the exception of those at the tip of the tail, which hold so firmly on to the spire of the inhabited shell that it is difficult to pull out the crab unbroken. There are a great many different kinds of hermit-crabs, and these utilise many forms of shelter. A very common species (*Eupagurus bernhardus*) is usually found tenanting the shells of the whelk (*Buccinum*); while another very common species (*E. prideauxii*) may be found inside shells of *Fusus*, *Murex*, *Cancellaria*, *Turbo*,

Buccinum, &c. Hermit-crabs very frequently illustrate Commensalism (q.v.) or external partnership with other animals, such as sponges, hydroids, and sea-anemones. Thus *E. bernhardus* may have associated with it the sea-anemone *Sagartia parasilica* or else a colony of *Hydractinia echinata*; and *E. prideauxii* is usually associated with the sea-anemone *Adamsia palliata* (see ANEMONE). The anemone masks the crustacean, and may also assist it with its stinging-cells; the anemone is carried about by the crab, and may get crumbs from its partner's table. As hermit-crabs grow they have

Common Hermit-crab shifting from one whelk shell to another.

not only to cast their own armature in the usual crustacean fashion, but they must periodically shift to a successively larger and larger house. In looking out for a new shell to tenant, hermit-crabs are naturally in a hurry, being then in a position of defencelessness unusual for them; and it has been observed that they do not always seek for an empty mollusc shell, but may evict the rightful owner of one which strikes their fancy. In changing its shell the hermit-crab sometimes contrives to take the partner sea-anemone with it. The common hermit-crabs feed on molluscs and animal debris. They are most interesting inmates of aquaria, but their voracity is very apt to reduce the population. The larvae are free-swimmers and quite symmetrical.

Some of the hermit-crabs, especially from deep water, are quite symmetrical. Such is *Tylaspis anomala*, from the south Pacific at a depth of 2375 fathoms, which has a very much shortened abdomen, with distinct segments, however, and well-developed symmetrical appendages. From the West Indies the Blake obtained *Pylocheles agassizii*, living in straight tubes of compacted sand, and quite symmetrical. Even more interesting is the symmetrical *Xylopagurus rectus*, living at depths of 300 to 400 fathoms, in open tubes of wood or bamboo-stem, into which the animal retreats head foremost, and guards the opening with firm plates on the end of the tail.

Xylopagurus rectus in its case (a) and free (b).

Some aberrant forms, probably derived from asymmetrical ancestors, are of great interest. Such is the large robber-crab (*Birgus latro*), inhabiting coral islands in the Indian and Pacific Oceans, which is linked by the genus *Cnemidibia* to ordinary hermit-crabs. It lives ordinarily on land, and has ridges and folds on its branchial chamber which serve for aerial respiration. It spawns in the sea, and may then utilise rudimentary gills which it also possesses. The young stages are free-swimming, and breathe by gills. After a period of marine life and a sequence of metamorphoses they creep ashore. The young robber-crab eventually makes its way inland. It feeds on the pulp of coconuts, hammering a hole with its heavy forceps, and uses the husk to line its burrow. To procure the nuts it often climbs the trees. See COMMENSALISM, CRAB, CRUSTACEA; the *Cambridge Natural History*, vol. iv.; J. R. Henderson, 'Challenger' Report on *Anomura*; Agassiz, *Voyage of the 'Blake'*; Darwin, *Voyage of the 'Beagle'* (1845); Alcock, *Naturalist on Indian Seas* (1902).

Hermodactyl. See COLCHICUM.

Hermón, MOUNT (now *Jebel-es-Sheikh*), 9150 feet high, is the culminating point of the Anti-Libanus range. See LEBANON.

Hermopolis Magna, an ancient town of Egypt, situated on the Nile, on the border of the Thebaid, and near the frontier line of upper and middle Egypt. Thanks to its position, Hermopolis grew to be a place of great importance, ranking next after Thebes. It had a celebrated temple sacred to Thoth, the ibis-headed god of letters, of which the portico alone is all that now remains. On the opposite or right bank of the Nile was Antinoöpolis, where the dead of Hermopolis were taken for burial. The modern name of Hermopolis is Ashmun or Eshmoon.

Hermosillo, capital of the Mexican state of Sonora, stands in a fertile plain on the Rio Sonora, 50 miles by rail N. of the port of Guaymas. It has a mint and other government buildings, a bank of issue, sawmills, distilleries, and shoe and furniture factories, and a large export trade in wheat and wine. Pop. 18,000.

Hermoupolis. See SYRA.

Hermsus, a river of Asia Minor, flowing through the plain of Sardis, and falling into the Gulf of Smyrna.

Herne Bay, a watering place of Kent, 12 miles W. of Margate. Founded in 1830, it has a pier 1213 yards long, an esplanade 1 mile long, and a handsome clock-tower. Bishop Ridley was vicar of Herne in 1538-40. Pop. 12,000.

Herne the Hunter, a figure in popular tradition, long supposed to range at midnight around an ancient oak in Windsor Forest. He is referred to in Shakespeare's *Merry Wives of Windsor*, and Herne's Oak continued to be an object of interest until it was blown down on 31st August 1863. Queen Victoria planted a young oak on the spot where the patriarch had stood, as was supposed, for 650 years.

Hernia (Lat.; probably from Gr. *ernos*, 'a sprout'), in its widest sense, signifies a protrusion, through an abnormal or accidental opening, of any organ from its natural cavity. Although hernia may occur in many parts of the body, the word, used by itself, is restricted to signify protrusion of the abdominal viscera, the condition popularly called *rupture*.

The way in which hernia may arise will be readily understood if we bear in mind that the abdominal viscera are subject to constant pressure from the diaphragm and other surrounding muscles.

If at any point the walls of the belly are not sufficiently strong to resist this pressure some portion of the viscera is driven through them, and a hernial tumour is formed. Certain parts of the abdominal walls, especially the inguinal and crural rings, and the umbilicus, being weaker than others, hernia most frequently occurs at these points. In some instances hernia is congenital, from abnormal deficiency of the walls; in other cases it may arise at any period of life as a result of violent bodily exertion. Sex, age, and occupation seem to have a marked influence in predisposing to hernia. Men are far more liable (in about the proportion of four to one) to this disease than women; though they are less so to those forms of the affection known as femoral and umbilical hernia. According to Malgaigne, in France one man in thirteen, and one woman in fifty-two, were the subjects of hernia. In respect of age he found that the liability was least about the age of thirteen (one in seventy-seven), after which it progressively increased until the close of life, rising between seventy and seventy-five to one out of every three.

A hernia is almost always composed of a *sac* and *its contents*. The sac is a portion of the Peritoneum (q.v.) corresponding to the aperture at which the hernia protrudes. It is pushed forward by the protruding viscera, and forms a pouch. The contents vary greatly, but generally consist of a portion of the small intestine (particularly of the ileum), forming the variety of hernia known as *enterocoele*. Omentum is often found in hernial sacs, either with or without intestine. Besides the viscera, the sac always contains a certain quantity of fluid secreted by its interior. Hernia is divisible (1) into *reducible*, or returnable into the abdomen, *irreducible*, and *strangulated*; and (2), according to its situation, into *inguinal*, *femoral*, &c.

The treatment of reducible hernia may be palliative or radical. The palliative treatment consists in the application of a truss (see below) to retain the protrusion within the abdomen. Each particular kind of hernia (femoral, umbilical, &c.) requires its special form of truss; and before it is put on, the hernia must be reduced, i.e. pressed back into the abdomen. The truss should then be applied, and should be worn during the whole day; when the person lies down at night it may be removed, or, if the hernia still tends to appear, a pad and light bandage may be substituted for the truss. The radical cure is effected by various operations, all of which, generally speaking, consist in obliterating the sac, and stitching together the margins of the opening. In youth a radical cure sometimes results if the truss is worn for two or three years, and if the hernia is never allowed to come down.

In irreducible hernia the protruded viscera cannot be returned into the abdomen, but there is no impediment to the passage of their contents or to their circulation. In these cases the patient is often liable to dragging pains in the abdomen, and to attacks of vomiting, in consequence of the movements of the abdominal organs being checked by the omentum or intestines being fixed. There is also constant danger of this hernia passing into the strangulated form. The treatment may be either palliative or radical. The palliative treatment consists in the employment of a truss with a hollow pad that shall embrace the hernia, and prevent any additional protrusion. An irreducible hernia may *sometimes* be converted into a reducible one by keeping the patient in the recumbent position, and on very low diet, for two or three months; at the same time keeping the bowels open by laxatives and injections, and maintaining equable pressure over the tumour. Radical cure is, as in the case of reducible hernia, by operation.

Hernia is said to be *strangulated* when a portion

of intestine or omentum that is protruded is so tightly constricted that it not only cannot be returned into the abdomen, but has its circulation arrested. This form is highly dangerous, because, if relief is not speedily afforded, the strangulated part becomes gangrenous. The causes of strangulation are various, but this condition most commonly arises from a sudden violent effort, by which a fresh portion of intestine is driven into a pre-existing hernia, which it distends to such a degree as to produce this complication. The most prominent early symptoms are flatulence, colic pains, &c. They are succeeded by vomiting first of the contents of the stomach, then of mucus and bile, and lastly of faecal matters, owing to inverted peristaltic action. If relief is not obtained the inflammation that commences in the sac extends to the peritoneum, and the ordinary signs of peritonitis appear. After a variable time comes gangrene or mortification of the part, and the patient speedily sinks.

The surgeon first tries to return the intestine, as in the preceding cases. This manipulation, termed the taxis, may be assisted by the internal use of chloroform, inhaled till it produces complete relaxation of the muscles, by the hot bath, &c. If this fails he must operate to divide the constriction, and may then complete the radical cure.

The necessity of having recourse to a suitable truss the moment that the slightest protrusion shows itself in any of the parts liable to hernia cannot be too strongly urged as a matter of necessary general knowledge. At whatever period of life a hernia occurs, if properly attended to and judiciously supported it usually gives little trouble, and if it occurs in early life, it may often be cured; whereas, if it be neglected, increase of bulk, and, subsequently, diseased states of the parts, often terminating in death, will almost certainly occur. A truss consists essentially of a pad or cushion attached to a metallic spring, with straps so arranged that its position may be retained during the varied postures of the body. A medical man should always be consulted in the choice of such an appliance, because a truss which allows the hernia to slip down past it is worse than none at all. Many varieties of trusses have been invented. There are occasional cases in which the common truss fails to support a rupture comfortably, and in these cases various instruments (such as elastic waist-bands with leg-straps, wide body-belts with special pads, &c.), for the most part the property of special instrument-makers, are often serviceable. The patient must expect to find the truss somewhat uncomfortable for a week or two, but will soon get used to it. The skin of the part upon which it presses should be regularly washed and bathed with eau de Cologne or spirit, as, without this precaution, boils are apt to form on it.

Hernösand. See HARNÖSAND.

Hero, priestess of Aphrodite, loved and was beloved by Leander, whose home was at Abydos, across the Hellespont. Hero's office and her parents' will forbade their union, but Leander every night swam the Hellespont to visit his beloved, guided by a lamp that burned on the top of a tower on the seashore. But one tempestuous night the light was extinguished, and Leander was drowned. Hero, when she saw his dead body washed ashore at daybreak, threw herself down from the tower into the sea and perished. A poem on this theme has come down to us under the name of *Museus*; the romantic story is alluded to by Ovid, Virgil, and Statius; and in modern times Marlowe and Chapman, Schiller and Leigh Hunt, have retold it in verse, whilst Grillparzer has made it the subject of a drama.

Hero OF ALEXANDRIA (Gr. *Hērōn*), a great mathematician and natural philosopher, was a pupil of Ctesibius, and flourished about 100 or 150 B.C. He seems to have invented a great number of machines and automata, among which are Hero's fountain; a steam-engine on the same principle as Barker's mill; a double forcing-pump used for a fire-engine, and various other similar applications of air and steam. Among his works which have come

Hero's Fountain.

down to us the most notable is on Pneumatics. His works, including the then lately discovered *Metрика*, were published by Teubner (1899 *et seq.*).—Another Hero, called Hero the Younger, who wrote on mechanics and astronomy, long had the credit of writing some of his namesake's books. According to some authorities he flourished at Alexandria in the 7th century A.D.; according to others, at Constantinople in the 10th.—**HERO'S FOUNTAIN** is a pneumatic apparatus, through which a jet of water is supported by condensed air. A simple mode of constructing it by means of glass tubes and a glass-blower's lamp is shown in the annexed figure. The column of water in the tube *a* compresses the air in *b*; this presses on the surface of the water in *c*, and causes it to gush out at *d*.

Herod, the name of a family which rose to power in Judæa during the period which immediately preceded the complete destruction of the Jewish nationality. The family was of Idumean descent; but, though alien in blood, was Jewish in religion, the Idumeans having been conquered and converted to Judaism by John Hyrcanus, 130 B.C. (1) **HEROD THE GREAT** was the second son of Antipater, who was appointed procurator of Judæa by Julius Cæsar, 47 B.C. At the time of his father's elevation Herod, either fifteen or twenty-five years of age, was made governor of Galilee, and afterwards of Coele-Syria; and ultimately he and his elder brother were made joint-tetrarchs of Judæa. But he was soon displaced by Antigonus, the representative of the Hasmonean dynasty, and forced to flee to Rome, where he obtained, through the patronage of Antony, a full recognition of his claims, and became tetrarch of Judæa, 40 B.C. Several years elapsed, however, before he succeeded in establishing himself in Jerusalem. On the fall of Antony he managed to secure a continuance of favour from Augustus, from whom he not only obtained the title of king of Judæa, but also a considerable accession of territory, 31 B.C. From this time till his death his reign was undisturbed by foreign war; but it was stained with cruelties and atrocities of a character almost without parallel in history. Every member of the Hasmonean family, and even those of his own blood, fell in succession a sacrifice to his jealous fears; and in the later years of his life the lightest shade of suspicion sufficed as the ground for wholesale butcheries, which are related in detail by Josephus. The slaughter of the innocents at Bethlehem is quite in keeping with his character; as was also his ordering the death of his wife Mariamne and his two sons by her. The one eminent quality by which Herod was distinguished, his love of magnificence in architecture, was evinced by the grandeur of the public works executed under his direction. Samaria rebuilt and Cæsarea were monuments of his zeal in building. Herod married no fewer than

ten wives, by whom he had fourteen children. He died of a painful disease at the age of seventy, the year of Christ's birth—i.e. in the year 4 before the Christian era, as fixed by Dionysius Exiguus (see the article CHRONOLOGY)—after a reign of thirty-seven years.—(2) HEROD ANTIPAS, son of Herod the Great by his wife Malthace, a Samaritan, was originally designed by his father as his successor; but by the final arrangements of the will of Herod the Great, Antipas was named tetrarch of Galilee and Perea. He divorced his first wife, the daughter of Aretas, king of Arabia Petrea, in order to marry Herodias, the wife of his half-brother Philip—an incestuous connection, against which John the Baptist remonstrated, and was in consequence put to death. It was during a visit of Herod Antipas to Jerusalem for the purpose of celebrating the passover that Jesus was sent before him by Pilate for examination. At a later time he made a journey to Rome in the hope of obtaining the title of king; but he not only failed in this design, but, through the intrigues of Herod Agrippa, was banished to Lugdunum (Lyons), where he died in exile.—(3) HEROD AGRIPPA I., son of Aristobulus and Berenice, and grandson of Herod the Great, was educated at Rome. He lived there in a very extravagant style until his debts compelled him to take refuge in Idumea. From this period almost to the death of Tiberius he suffered a variety of misfortunes, but, having formed a friendship with Caligula, he received from him, on his accession to the throne, the tetrarchies of Abilene, Batanaea, Trachonitis, and Auranitis. After the banishment of Herod Antipas he received his tetrarchy also—viz. Galilee and Perea. Claudius added to his dominions Judaea and Samaria, and he was thus the ruler of a more extensive territory than even was Herod the Great. He died at Caesarea of a painful and incurable malady, 'eaten of worms' (Acts, xii. 23), in the fifty-fifth year of his age, and the 44th of the Christian era.—(4) HEROD AGRIPPA II., son of Agrippa I., was at Rome when his father died, and only seventeen years of age. Claudius therefore resolved to detain him for some time, and in the meanwhile re-transformed the kingdom into a Roman province. In 53 A.D. he left Rome, and received from the emperor nearly the whole of his paternal possessions, which were subsequently enlarged by Nero. Like his ancestor Herod the Great, Agrippa was fond of building, and spent great sums in adorning Jerusalem and other cities; but he failed to secure the good-will of the Jews. He did all in his power to dissuade them from rebelling against the Romans. When Jerusalem was taken he went with his sister to live at Rome, where he was made prætor, and where he died in his seventieth year or later. It was before him that Paul made his memorable defence.

Herodas, or **HERONDAS**, a Greek poet of the 3d century B.C., probably from the island of Cos, of whose *Mimiambi* (mainly scenes of Greek life in dialogue) only small fragments were known till some 700 verses from eight different poems were recovered from an Egyptian MS. in the British Museum and published by Kenyon (1891). There is an excellent edition by Walter Headlam and A. D. Knox (1922).

Herodian, a Greek historian, who lived in Rome. His *History*, in eight books, extends from the death of Marcus Aurelius (180) to Gordian III. (238), and is fairly trustworthy. See editions by Bekker (1855) and Mendelssohn (1883).

Herodotus, 'the father of history,' was born between 490 and 480 B.C., between the first and the

second of those two Persian invasions of Greece of which he was hereafter to write the history. He was born at Halicarnassus, one of those Greek colonies on the coast of Asia Minor which were conquered by the Persians, and whose efforts to recover liberty were the cause of the Persian wars. Halicarnassus, originally founded by Dorian settlers, had in course of time become an Ionic city, and consequently Herodotus wrote in the Ionic dialect. When the colonies were freed from the Persian yoke the citizens of Halicarnassus differed as to the form of government to adopt, and Herodotus left his native town. His travels were of remarkable extent: he travelled not only over Asia Minor and the islands of the Aegean Sea, but over Greece proper. He spent much time at Athens and at Delphi, and paid visits also to Sparta, Corinth, Thebes, Olympia, and Dodona. He also journeyed to Macedonia, Thrace, and the coasts of the Black Sea. Above all he penetrated to the interior of the Persian empire, to Susa, Ecbatana, and Babylon; and he 'did' Egypt. On the journey thither he visited Tyre, and from Egypt he reached Cyrene. In 443 B.C. the colony of Thurii was founded by Athens, and Herodotus joined it, whether in that year or not is uncertain. From Thurii he visited Sicily and Lower Italy. He lived to the beginning of the Peloponnesian war, 432 B.C., and perhaps not later than 425 B.C., but when, where, or how he died we do not know. Cuneiform inscriptions prove that the revolt of the Medes referred to in book i. 30 took place under Darius I., and not Darius II., so that we cannot infer from the passage that Herodotus was alive at the latter date (409 B.C.).

Herodotus, then, spent a large part of his life in travelling. These travels he undertook for the purposes of his history, and his activity, mental as well as physical, in collecting information and making inquiries, historical, geographical, ethnological, mythological, and archaeological, was extraordinary. His history was designed to record not only the wars but the causes of the wars between Greece and the barbarians: thus, as to the Greek the whole world was either Greek or barbarian, he could have no difficulty in finding a place for all his information. The way in which he actually weaves it together is as follows. Beginning with the conquest of the Greek colonies in Asia Minor by the Lydian king Croesus, he has an opportunity for giving a history of the kings of Lydia and a description of the country. The Lydians were conquered by the Persians, whose history and empire have now to be described. Amongst the conquests of Cyrus were Babylon and the Masagetae; of Cambyses, Egypt, the account of which fills book ii. In book iii. the organisation of the Persian empire by its great statesman-king, Darius, enables Herodotus to emphasise the contrast between the might and magnitude of Persia on the one hand and the inferiority of Greece on the other. The invasion of the Scythians by Darius in book iv. allows Herodotus to place the remarkably interesting ethnological information he had gathered from the emporiums on the coast of the Black Sea. And the statement that Darius intended to invade the north coast of Africa brings in what Herodotus had learned at Cyrene and on the journey to it. In books v. to ix. we have the history of the two Persian wars.

Herodotus has been called 'the father of history,' but, as we have seen, he has an equal right to be called 'the father of geography.' This combination of history and geography is not a feature which distinguishes him from his predecessors, the 'logographers.' They not only composed chronological lists, containing probably a brief account of the events recorded, but they also composed topographical works, which, however, contained in many

cases a history of the places described. Thus history and geography (scarcely discriminated) existed before Herodotus' time, nor did he divide them. But the work of Herodotus is to the bald, brief, disconnected notes of his predecessors what the work of Homer was to the poems of his predecessors. It is the beginning of Greek prose, as is Homer's of Greek verse; but whereas we have no fragment of any of the poets who lived before Homer, we have of the prose-writers before Herodotus, and the advance in point of form is remarkable. In reading Herodotus we feel very strongly that the style is the man, possibly because we know so little of the man; but in any case the character revealed by the style is sympathetic in a high degree, and probably few writers of any age or country have so many devoted personal friends as Herodotus counts amongst his readers. He is so simple, so frank, so talkative, amiable, and respectable. He wrote indeed not to be read, but to be heard, like all other classical Greek authors, and he read his history in public at Athens and other places. Thus we may account partly for the fact that we seem to hear him talk rather than to be reading an author. But, beyond the charm of style, Herodotus had the knack of taking interest in the right things—i.e. things which have continued to interest people for 2300 years. On the one hand, he could write in a spirit worthy of the glorious fight for liberty fought by the Greeks at Marathon, Thermopylae, and elsewhere. On the other, he delighted in the manners and customs of strange peoples, and in things ancient and mysterious. As to his honesty as a historian there is practically no doubt—the author of the *De Malignitate* and Professor Sayce notwithstanding: he never says what he does not believe. He does not apparently suppress alternative versions, and he distinguishes between what he saw and what he was told. He did not believe all that he was told, though he did believe occasionally things which were not true. He is not a scientific historian: what he tells is frequently not history: it is something better—legend. Very possibly he wholly misconceives the strategy of Mardonius, but he preserves the *ethos* of the Greeks who fought. His story about Rhampsinus is altogether unhistorical, but it is more valuable for the history of the people than hieroglyphic inscriptions recording the number of captives taken or killed by some king.

The standard edition is Stein's (1869-71); others are by Kellenberg, Van Herwarden, and Hude. There are commentaries by Stein, Bahr, Rawlinson (with translation), and How and Wells (1912); English translations by B. R. (1884; new ed. 1925), G. C. Macaulay (2 vols. 1890) and A. D. Godley (1921-24). The appendices to Sayce's edition of books I-iii. are valuable; and important contributions to the elucidation of Herodotus are due to Macan, Grundy, Munro, Mahaffy, Hogarth, Myres, Bury, and Wells (1923). See Glover's *Herodotus* (1924).

Heroes were, in the Homeric period, the kings, princes, generals, leaders, all brave warriors, and men who excelled in strength, courage, wisdom, and experience. Many of these had, on account of such qualities, a fabled origin, half human, half divine, and were honoured after their death with a kind of adoration or inferior worship. These heroes and demigods were recognised as the special patrons or protectors of particular countries, cities, or families, as the Pelopidae, Atridae, &c., and temples and altars were raised to them. Poetry exalted the heroic sentiment to sublimity; and poems which celebrate the deeds of heroes are

themselves termed heroic. The imaginary time when heroes and other semi-divine beings lived on earth was called the Heroic Age. See M. P. Foucart, *Le Culte des Héros chez les Grecs* (Paris, 1918); L. R. Farnell, *Greek Hero Cults and Ideas of Immortality* (1921; euhemeristic); and for the much later but strangely similar Heroic Age of the Teutonic peoples Chadwick, *Heroic Age* (1912).

Heroic Poem. See EPIC POETRY. The name is specially applied, however, to a compromise between epic and romance which flourished in the 16th and 17th centuries under the influence of Tasso and of the kindred heroic play and heroic romance. The chief examples in English are D'Avenant's *Gondibert* and Chamberlayne's *Pharonnida*. See Saintsbury, *Caroline Poets*; for the heroic play, Pendlebury, *Dryden's Heroic Plays* (1923); for the heroic romance, the article NOVELS.

Heroic Verse. See ALEXANDRINES, BLANK VERSE, COUPLET, HEXAMETER.

Hérolf, LOUIS JOSEPH FERDINAND, French musical composer, was born at Paris on 28th January 1791, and studied at the conservatoire of music in that city. His earliest successes were achieved with *Mlle. de la Vallière* (1812), a cantata, which gained him a travelling scholarship; the opera, *La Gioventù di Enrico Quinto* (1815); and the comic opera, *Les Rosières* (1816). None of his succeeding pieces met with success, until the opera *Marie* appeared in 1826. *Zampa* (1831) and *Le Pré aux Clercs* (1832), which followed next, were both decidedly successful; the former is still put on the stage from time to time. Hérolf died on 19th January 1833 at Thernes near Paris. See Jouvin's *Hérolf, sa Vie et ses Œuvres* (1868).

Heron, a genus (*Ardea*) and family (*Ardeidae*) of birds of the order *Herodiones*. The *Herodiones*

Flight of Crested Heron, 10 images per second (after Marey).

(which includes also the families of storks, spoonbills, and flamingoes) are large birds covered with long loose down, with large wings, and a hard horny bill longer than the head, compressed from side to side, and united to the skull by firm broad bones. The *Ardeidae* are distinguished from the other families by their large hind-toe, which rests on the ground and has a large claw equal in size to the claw of the middle toe, and by the inner margin of the middle toe having a pectinated or comb-like structure. The family comprises five genera—the Herons (*Ardea*), the Night Herons (*Nycticorax*), the Bitterns (*Botaurus*), the Boatbills (*Cancroma*), and the Tiger-bitterns (*Tigrisoma*). In the Heron genus—which includes the species commonly known as Egrets—the plumage is beautiful, but seldom exhibits very gay colours, white, brown, black, and slate, finely blended, generally predominating. The body is small in proportion to the length of the neck and the limbs. The neck is usually curved. See the illustration for the position of the neck, wings, &c., in flight—when the long legs are carried straight out, projecting like a tail. Herons are very voia-

cious, feeding mostly on fish and other aquatic animals; but they also often prey on snakes, frogs, rats, and mice, and the young of other birds. They are usually shy, solitary birds, going about singly, but at nesting-time congregating in numbers, possibly more from community of purpose than from the true gregarious instinct. The Common Heron (*Ardea cinerea*) measures about three feet from the point of the bill to the tip of the tail. It is of a delicate gray colour on the upper parts, the quill-feathers are black, the tail of a deep slate colour, and the long plume is glossy dark. It generally builds its nest on a high tree; and as many as eighty nests have been counted on a single oak. Though in the days of falconry, when it was the chief game pursued, it was highly prized for the table, the common heron is now the object of almost universal hostility. Its geographical distribution is wide, extending from Britain to the countries of northern and southern Europe, being most plentiful in Holland, extending into northern Africa, Caucasus, India, Japan, and Java.—The

Common Heron (*Ardea cinerea*).

Purple Heron (*A. purpurea*) is a somewhat rare British species.—The Great White Heron or Great Egret (*A. alba*), an extremely beautiful bird with perfectly white plumage, much of it loose and flowing, is an accidental visitor to Britain. It is more common in south-eastern Europe and in some parts of Asia, where its upper tail coverts are much worn as plumes.—The Little Egret (*A. garzetta*), a smaller copy of the great egret, frequenting the same localities, is about two feet long, and rather quicker in flight than the larger species.—The Buff-backed Heron (*A. aquinotialis*) of southern Europe is an insect feeder, and by no means so shy as other species.—America has many species of herons, most numerous in its warmer parts. A common species of the temperate parts is the Green Heron (*A. virescens*), whose flesh is much esteemed. Other important species are the Great Blue Heron (*A. herodias*), the Great White or Florida Heron (*A. occidentalis*), the Great White Egret (*A. egretta*), and the Little White Egret (*A. candidissima*).—The Peacock Heron (*A. helias*) of South America, a small heron of exquisitely graceful shape and mien, with plumage variegated with coloured spots and bars, is a favourite pet-bird of the Brazilians.

Herondas. See HERODAS.

Herophilus, one of the greatest physicians of antiquity, and co-founder of the celebrated medical

school of Alexandria, was born at Chalcedon, in Bithynia, and flourished in the 4th and 3d centuries B.C. He distinguished himself in particular by his devotion to anatomy, especially of the brain and those parts which were less known. He was a skilful dissector, and is said to have even dissected criminals alive; moreover, he was a bold and dexterous surgeon. The few fragments of his writings which remain were published at Göttingen in 1840.

Herostratus. See EPHEBUS.

Herpes (Gr., from *herpō*, 'I creep'), the name of a group of diseases of the skin, characterised by the presence of clusters of vesicles on an inflamed base. There are two well-defined classes included under the name.

(1) *Catarrhal herpes* occurs most commonly at the edge of the lip, and often attends some febrile disease, especially acute inflammation of the lungs; but may also follow some local irritation, or be without assignable cause. It is attended sometimes by burning or itching sensations, but rarely by pain. The vesicles dry up into a scab, which falls off in the course of a few days. No treatment is generally necessary; but it is very apt to recur. It appears less commonly on other parts of the face, on the mucous membrane of the mouth, and on the genital organs.

(2) *Herpes zoster* (Gr.; Lat. *zona*; Eng. *shingles*, plural of Old Eng. *sengle*, 'a girth,' through Fr. from Lat. *cingulum*, words all meaning 'a girdle') is most commonly met with along the course of one of the intercostal nerves, whence the name. It is now known that the inflammation of the skin depends upon an inflammation of the nerve supplying the area affected, though many forms of inflammation of the nerves occur without producing herpes. Its occurrence can sometimes be traced to a blow, to diseased tissues in the neighbourhood, or to the prolonged administration of arsenic; but more often no cause can be assigned for it. The appearance of the characteristic eruption is generally preceded for some days by neuralgic pain in the affected part; inflammation of the skin in patches, development of vesicles, formation of scabs and their subsequent detachment generally run a pretty uniform course, occupying about a fortnight. In young people nothing is left but slight scarring of the skin; but in those beyond middle life an extremely intractable form of neuralgia often remains, and may persist for months. The disease may occur at any age, but a second attack is quite exceptional. More than one intercostal nerve may be affected at once; but very seldom two on the opposite sides, so that the popular superstition 'that shingles which meet round the body always prove fatal' is not likely to be often practically refuted. Though commonest in connection with the intercostal nerves, herpes zoster may occur on almost any region of the body. The brow is a frequent situation; and if the eye is affected, as sometimes happens, it may be seriously damaged. No treatment seems to be effective in arresting the course of the disease; but painting with flexile collodion, or application of zinc ointment over the inflamed patches, diminishes their irritability.

Herpetology (Gr. *herpēton*, 'a reptile,' and *logos*, 'a discourse'), that branch of natural history which treats of reptiles. See REPTILES.

Herrera, FERNANDO DE, a Spanish lyric poet, of whom we only know that he was born at Seville in 1534, took orders, and died in 1597. As a poet he ranked so high in the opinion of his contemporaries that they bestowed upon him the appellation of the *divine*. Many of his love-poems are remarkable for tender feeling, while his odes, such

as that on the 'Battle of Lepanto,' frequently display a lofty enthusiasm; but his language is very artificial, being full of words, inflections, and inversions in imitation of Greek, Latin, and Italian authors. Many of his poems were accidentally burned shortly after his death; most of what survived were published by Pacheco, the painter, in 1619, and all were printed in the *Coleccion* of Ramon Fernandez (1786; new ed. 1808). Herrera wrote in prose a good *Account of the War in Cyprus* (1572), and translated from the Latin of Stapleton a life of Sir T. More (1592).

Herrera, FRANCISCO, surnamed EL VIEJO (the Elder), Spanish painter, was born in Seville in 1576. His drawing was correct, and his pictorial style is marked by energy, freedom, and boldness, and he became the founder of a school. Herrera's masterpiece was the 'Last Judgment,' in a church at Seville. Besides historical pieces, he also painted such subjects as wine-houses, fairs, carnivals, and the like; he was a clever worker also in bronze. In 1650 he removed to Madrid, and died there in 1656. Some of his best works are in the Louvre at Paris. —His youngest son, FRANCISCO HERRERA, surnamed EL MOZO (the Younger), was born at Seville in 1622. He studied under his father, but to escape his roughness and cruelty ran away to Rome, where he became celebrated for pictures of still life, especially for fish-pieces. Returning to Spain after his father's death, he at first settled in Seville, and was in 1660 appointed sub-director of the academy there; but he soon betook himself to Madrid, where he became painter to the king. His best works are a fresco, 'The Ascension,' in the Atocha church in Madrid, and 'San Francisco,' in Seville cathedral. Herrera died at Madrid in 1685.

Herrera y Tordesillas, ANTONIO, Spanish historian, was born at Cuellar, in Segovia, in 1549, was appointed by Philip II. historiographer of the Indies and of Castile, and died at Madrid, 29th March 1625. His principal work is a *General History of Castilian Exploits in the Pacific* (1601-15), that is, a history of the Spanish-American colonies from 1492 to 1554 (Eng. trans. by John Stevens, 1725). His *Descripcion de las Indias Occidentales* (1601 and 1615) forms an introduction to the above work. He also wrote on the history of England and Scotland in the time of Mary Stuart; histories of Portugal, of the world in the time of Philip II., of the League, and of the Spanish, French, and Venetians in Italy.

Herrick, ROBERT, a great English poet, was born in London, the fourth son and seventh child of a prosperous Cheapside goldsmith of good Leicestershire descent, and was baptised 24th August 1591. His father died the year after, not without suspicion of suicide, and the boy was bound apprentice for ten years to his uncle, afterwards Sir William Herrick, also a well-to-do Cheapside goldsmith. By September 1613, however, we find him a fellow-commoner at St John's College, Cambridge, whence he sent fourteen letters, still extant, to his guardian-uncle, who appears to have been stingy in his allowances of money. The last letter is dated from Trinity Hall, whither he writes he had migrated for economy. Herrick took his M.A. in 1620, and apparently came next to London, where, no doubt, he plunged light-heartedly into the gaieties of the town, as well as 'those lyric feasts made at the Sun, the Dog, the Triple Tun.' He was already a poet, and his 'wild, unbaptised rhymes' quickly earned him the friendship of Ben Jonson and his ring of hilarious spirits. In 1629 his mother died, and in the same year he took orders, and was presented to the sequestered living of Dean Prior, near Totnes, in Devonshire. He bemoans his lonely banishment in 'loathed

country life' among 'currish' natives in 'dull Devonshire,' but from his poems we cannot doubt that his keen eye and kindly heart found him a consolation in the observation of the honest country-folk around him whose old-world customs are mirrored so charmingly in his verse. Of his clerical life we know but little, although Wood speaks of his 'florid and witty discourses,' and tells us he was 'beloved by the neighbouring gentry.' He has immortalised his housekeeper, 'Prue' or Prudence Baldwin, as well as his spaniel 'Tracy,' and a tradition long survived of a 'favourite pig, which he amused himself by teaching to drink out of a tankard.' His 'Julia' is more visionary than these, but no doubt had her existence also. In 1647 the Puritan supremacy ejected him from his vicarage and drove him to London, whence he returned to reassume his duties in August 1662. Here twelve years later he died, being buried 15th October 1674. A monument was placed in the church in 1857.

Herrick's one volume of verse contained the *Hesperides*, dated 1648, and *Noble Numbers*, dated 1647. The last is a collection of professedly religious poetry; the former, an ill-arranged group of lyrical poems addressed to friends and eminent contemporaries, amatory poems, epithalamia, epigrams, fairy poems, and short occasional odes and poems on all kinds of subjects, of which sixty-two had already seen the light in *Wit's Recreations* (1640). The whole embrace more than 1200 poems of lengths varying from five or six pages to a single couplet, many of which are among the most exquisite examples of lyrical art in English. Of these it is enough to name 'Corinna's going a Maying,' 'The Mad Maid's Song,' 'The Night Piece to Julia' ('Her eyes the glow-worm lend thee'), 'To the Virgins' ('Gather ye rose-buds while ye may'), 'To Daffodils,' 'Cherry Ripe,' 'To Anthea' ('Bid me to live'); and, among religious poems, such masterpieces as 'The Litany,' 'The Dirge of Jephthah's Daughter,' and 'A Thanksgiving to God' ('Lord, thou hast given me a cell'). Much of his religious poetry is weak, but these are immortal. Yet the reader turns most often to his secular poems, in almost every line of which he will find a charm of a quite peculiar nature, save only in the epigrams, which are often poor and sometimes gross. The last laureate of fairyland, his 'Fairie Temple,' 'Oberon's Feast,' and 'Oberon's Palace' were not unworthy to follow Shakespeare's *Midsummer Night's Dream* and Drayton's *Nymphidia*.

The *Hesperides* is one of the sunniest books in English literature, consummate in finish, exquisite in fancy, fresh and natural throughout, and rich in sweet and delightful pictures of the homely English country and the quaint, kindly, old-world customs of her folk. His love-poems are stamped with a real *abandon* that is not Horatian and not Anacreontic, but all his own, and ever throughout his joyousness the ear detects an undertone of melancholy. In unforced sweetness of melody and perfect harmony of sound and sense Herrick rises above all his brethren among the Caroline lyrists, and, indeed, follows closely in the steps of Shakespeare. Like the master he is thoroughly natural, unaffected, and English. We do not look for depth and intensity of passion in his work, but within his limits he attains perfection. The fresh fragrance of English meadows lives in his verse, and will beget perpetual delight as long as English literature is read. He sleeps secure of the eternity of fame for which he longed, and which he half-promised to himself.

After being neglected for more than a hundred years Herrick's poems were revived by Nichols (Sylvanus Urban) in the *Gentleman's Magazine* (1796-97). Editions

followed by Dr Nott (1810), T. Maitland (Lord Dundrennan, 1823), W. C. Hazlitt (1869), Dr Grosart (3 vols. 1876, with memorial-introduction), Pollard (1905), and F. W. Moorman (1915). See also Gosse in *Seventeenth-Century Studies* (1883); and works on Herriek by Moorman (1910), and (in French) by Floris Delattre (1912).

Herring (*Clupea harengus*), one of the most valuable of food fishes, in the same genus as sprat, pilchard, and shad, in the family Clupeidae, in the sub-order of bony fishes known as Physostomi, i.e. with an open air-bladder. In the herring this organ is connected by a duct with the end of the stomach and with the exterior near the anus; it is also connected in front with the spaces surrounding the ear. The family includes some fresh-water forms and some shads that go up rivers to spawn, but the majority are exclusively marine. The herring itself frequents the northern parts of the Atlantic and the seas north of Asia, and occurs in great migratory shoals. The spindle-shaped body is often a foot long, but 15-inch forms are well known; the coloration of the living animal is an extraordinarily beautiful harmony of blue and green, silver and gold; the approximately circular scales are thin, and come off readily; the dentition is feeble, but effective enough for the delicate food, which consists mainly of minute crustaceans, small pelagic molluscs (Pteropods), and the larvæ of worms and other marine animals. Occasionally the herring devours other fishes. It is itself preyed upon by cod, coalfish, salmon, sharks, dogfish, seals, cetaceans, and various sea-birds like the gannet. But man levies the heaviest toll.

On the question of the occurrence of distinct races of herring there has been much discussion, as yet with little secure result. It is certain that the fish exhibits considerable variability. The facts as to the herring's migrations or mass-movements are also very inadequately known, but it is certain that the fish is given to roving, passing from near the coast to the open sea, and from near the surface to considerable depths. It seems that great distances may be covered, and it is probable that the huge shoals of herring that form the basis of the British east coast fishery in summer and autumn come in by the north from the Atlantic, and move gradually southwards.

Spawning herrings may be obtained all round the year—the time varying with age and locality—but on the coast of Scotland, for instance, there are two well-marked and brief spawning periods, one in spring (chiefly March and February) and the other in autumn (chiefly August and September). There are favourite spawning-grounds at various distances from the shore, and these are frequented year after year. The fertilised eggs sink to the floor of the sea, and attach themselves to stones, seaweeds, zoophytes, and the like, the egg-membrane being covered with viscid material. It has been estimated that one female may produce 20,000 to 40,000, or even more. The duration of embryonic development varies greatly (from a week to a month) with the temperature of the water, being lengthened out by cold. The newly hatched larva is from $\frac{1}{8}$ to $\frac{3}{8}$ of an inch in length; it is still encumbered with yolk, and lies on the bottom, with spasmodic upward movements. After the absorption of the yolk (3–7 days) the transparent body becomes attenuated and eel-like, and the larvæ or post-larval stages swim vigorously and gregariously in serpentine fashion, and move from near the bottom to the mid-waters. When the shape of the adult is approximately attained, and with it the silvery sheen, the young creatures are called herring-fry; they occur near the surface, and many move shorewards. In this littoral phase they are often netted, and form the chief constituent of

'whitebait.' The growth of the herring is slow. At the end of the year in which it was born the spring herring rarely exceeds 2 inches. At two years the length is about 4½ inches, at four years nearly 8, and at six years a little over 10. Sexual maturity seems to be attained by both sexes when five years old. The herring is a delicate, high-strung fish, difficult to keep in captivity; it is apparently nervous and timid; it is believed to be frightened away by noises; it dries rapidly when it is taken out of the water—a fact to which the proverbial saying 'as dead as a herring' probably refers. In the past it has been chiefly caught by drift-nets, which allow immature herrings to escape through the meshes; it is also caught by trawling.

See Smitt's *Scandinavian Fishes* (1895); McIntosh and Masterman, *British Marine Food Fishes* (1897); J. T. Cunningham, *Marketable Marine Fishes of the British Islands*; T. Wemyss Fulton and others in *Reports of the Fishery Board for Scotland*, notably Fulton 'On the Growth and Age of the Herring' (1906). See also **FISHERIES**.

Herring, FRESHWATER. See **COREGONUS**.

Herrings, BATTLE OF. See **FASTOLF**.

Herriot, ÉDOUARD, French man of letters and politician, was born in 1872. In 1894 he published a volume on *Philo le Juif* (Philo Judæus) which brought him into notice. In 1896 he became professor of 'rhétorique' at Lyons, to which town he was appointed mayor in 1905. His standard work on *Mme. Récamier et ses amis* gained him his doctorate, and he has also published *Agir* (1917), *Créer* (1919), and *La Russie Nouvelle* (1922). He was elected senator in 1912, and after holding many posts during the Great War became radical prime minister in 1924 on the fall of Poincaré, and at once took up the Ruhr problem.

Herrnhut, a small town in Saxony, 18 miles SE. of Bautzen, celebrated as a chief seat of the Moravian Brethren (q.v.) or Herrnhuters, who settled here in 1722.

Herschel, SIR WILLIAM, born at Hanover, November 15, 1738, was the son of a band-master, and was educated as a professional musician. He first visited England as a member of the band of the Hanoverian Guards; but in 1757 he established himself in England, becoming a teacher of music in the town of Leeds, whence he went to Halifax as organist, and subsequently (1766) in the same capacity to Bath. Here he would seem to have first turned his attention to astronomy. Wanting a superior telescope, and unable to afford to buy a good reflector, he made one for himself—a Newtonian, of 5 feet focal length, and with this applied himself to study the heavens. In 1781 he made his first discovery, being a new planet, which at first he took for a comet. It was detected by an exhaustive process of surveying the heavens, which Herschel was the first to follow, taking the stars in regular series, and examining them all in their groups through the same instrument. The result of his discovery was his appointment to be private astronomer to George III., with a salary of £200 (afterwards £250) a year. He then went to live at Slough, near Windsor, where, assisted by his sister Caroline, he continued his researches. Herschel married a Mrs Mary Pitt, and left one son, John. He was knighted by George III., and made a D.C.L. by the university of Oxford; he became rich partly through his wife's jointure, and partly through selling mirrors for reflecting telescopes. He died at Slough, 25th August 1822.

Herschel contributed sixty-nine papers to the *Philos. Trans.* between the years 1780 and 1815; and to the first vol. of *Mem. of the Astron. Society* he contributed a paper 'On the Places of 145 New

Double Stars.' He greatly added to our knowledge of the solar system: he discovered Uranus (called by him *Georgium Sidus*) and what he took for its six satellites, and two satellites of Saturn. Besides this he detected the rotation of Saturn's ring, the period of rotation of Saturn itself and that of Venus, the existence of the motions of binary stars, the first revelation of systems besides our own. He extended our knowledge of the Milky Way and the constitution of nebulae, and, in fact, was the first to give the human mind any conception of the immensity of the universe. His catalogue of double stars, nebulae, &c., and tables of the comparative brightness of stars, and his researches in regard to light and heat would of themselves entitle him to the first rank as an astronomer and natural philosopher. He erected a famous monster telescope of 40 feet length. It was begun 1785, and finished 1789, in which year he by means of it detected the sixth satellite of Saturn. See books on Herschel by Holden (New York, 1881), Sime (1900), and Macpherson (1919).

His sister, CAROLINE LUCRETIA, was born 16th March 1750, and lived in Hanover till 1772, when she came to England to live with her brother at Bath. When William turned astronomer she became his constant helper; and on his being appointed private astronomer to George III. she acted as his assistant, doing all the duties of an assistant-astronomer, and in that character receiving a small salary from the king. While discharging her duties in this position she found time for a series of independent observations with a small Newtonian telescope, made for her by her brother. Her special business was to sweep the heavens for comets, eight of which she discovered, in regard to five of which she has the credit of priority of discovery; and several remarkable nebulae and clusters of stars included in William's catalogues were described from her original observations. In 1798 she published, at the expense of the Royal Society, *A Catalogue of Stars taken from Mr Flamsteed's Observations*, which contained 561 stars omitted in the British catalogue. She lived with her brother during the whole of his career, sharing his labours and distinctions, and on his death returned to her native country. She was then seventy-two years of age, but she lived to be ninety-eight, retaining all her faculties to the last. In 1828 the Astronomical Society conferred on her their gold medal, and she was an honorary member of the society. She died 9th January 1848. See her *Memoir and Correspondence*, edited by Mrs Herschel (1876).

SIR JOHN FREDERICK WILLIAM HERSCHEL, the only son of Sir William, was born at Slough, 7th March 1792, and educated at Eton and St John's, Cambridge, where, in 1813, he was senior wrangler and first Smith's prizeman. His first publication was *A Collection of Examples of the Application of the Calculus of Finite Differences* (1820). In 1822 he applied himself especially to astronomy, using his father's methods and instruments in observing the heavens. For a time he worked with Sir James South in re-examining the nebulae and clusters of stars described in his father's catalogues. The results of the re-examination were given in 1833 to the Royal Society in the form of a catalogue of stars in order of their right ascension. The catalogue contained observations on 525 nebulae and clusters of stars not noticed by his father, and on a great number of double stars—in all between 3000 and 4000. This important contribution to science led to his being acknowledged as the worthy successor of his father; so early, indeed, as 1826 the Royal Society had voted to him and South a gold medal apiece for their observations on double stars; but by 1833 his pre-eminence was beyond the

necessity of being marked by acknowledgments. His treatises on Sound and on the Theory of Light had appeared in the *Encyclopædia Metropolitana* (1830-31); his treatise on Astronomy (1831) and the 'Preliminary Discourse on the Study of Natural Philosophy' in Lardner's *Cyclopædia*; not to mention his papers in the *Transactions of the Astronomical Society*. In January 1834 Herschel arrived at the Cape of Good Hope, with the intention of completing the survey of the sidereal heavens, by examining the southern hemisphere as he had done the northern. Here he established his observatory at Feldhausen, six miles from Table Bay; and in four years, working all the time at his own expense, he completed his observations. The public interest taken in his labours was, as might be supposed, very great; but though now and then gratified by partial statements of his results, it was not till 1847, nine years after his return from the Cape, that it received full gratification in the publication of a volume of *Astronomical Observations made at the Cape; being the Completion of a Telescopic Survey of the whole Surface of the Visible Heavens commenced in 1825*. It need not be said that the results of these labours are invaluable. They are now incorporated into all books on astronomy. Herschel, when at the Cape, gave an impulse to the science of meteorology, having the merit of having suggested the scheme for taking meteorological observations simultaneously at different places.

On his return to England honours were showered on him—he was made D.C.L. of Oxford, and, on Queen Victoria's coronation, a baronet. He was president of the Astronomical Society, and in 1850 became Master of the Mint. His articles on Meteorology, Physical Geography, and the Telescope, contributed to the *Encyclopædia Britannica*, were published separately; and his *Popular Lectures on Scientific Subjects and Collected Addresses* are well-known works. Herschel was also a distinguished chemist, and attained important results in photography independent of Fox Talbot. His researches on the undulatory theory of light were very valuable, and he made verse translations from Schiller and from the *Iliad*. He died at Collingwood, in Kent, on 12th (not 11th) May 1871, and was buried in Westminster Abbey near Sir Isaac Newton. His *Scientific Papers* (2 vols.) were published by the Royal Astronomical Society in 1912. See Miss Clerke, *The Herschels and Modern Astronomy* (1896).

Herschel, or URANUS. See PLANET.

Hersfeld, an old town of Hesse-Nassau, on the river Fulda, 25 miles N. of Fulda. Here are a fine Gothic church, built in 1320; the ruins of the cathedral, destroyed by the French in 1761; and the famous Benedictine Abbey, founded in 769.

Hership, an old Scots law term for the offence of carrying off cattle by force.

Herstal. See HERISTAL.

Hertford, the county town of Hertfordshire, 26 miles N. of London by rail, is situated on the Lea, which is navigable for barges up to this point. It contains few buildings of any architectural importance, save one ancient church. There is much trade in corn, malt, and flour. Hertford returned two members till 1867, but in 1885 ceased to be a parliamentary borough. Pop. 11,000. (See SEYMOUR; WALLACE, SIR RICHARD.) The New River (q.v.) has its source a mile east of the town. Of the old castle of Hertford, commenced by Edward the Elder about 905 to protect the inhabitants from the incursions of the Danes, and strengthened by William the Conqueror, but a small portion now remains; the present castle was built by William Cecil, Earl of Salisbury, or Sir William Harrington,

in the reign of James I., and in 1805-9 was occupied by the East India Company as a temporary college during the erection of Haileybury (q.v.). See Turner's *History of Hertford* (1830).

Hertfordshire, or **HERTS**, an inland county of England, extending 35 miles in a north-easterly direction and 20 miles in mean breadth, is bounded N. by Cambridge, E. by Essex, S. by Middlesex, and W. by Buckingham. It contains 632 sq. m., of which more than one-half is under tillage, one-fourth pasture, and one-seventeenth in wood; is divided into 8 hundreds, and contains the city of St Albans, and 2 other municipal boroughs—viz. Hertford (the county town) and Hemel Hempstead. Other towns are Cheshunt, Barnet, Letchworth, Watford, Hitchin, and Bishop-Stortford. Pop. (1801) 97,577; (1841) 156,660; (1881) 203,140; (1911) 311,284; (1921) 333,236. The surface is mostly level, except in the north, where a branch of the Chiltern Hills skirts the county, Kensworth Hill (904 feet) being the highest elevation. The principal rivers are the Lea, the Stort, and the Colne, all affluents of the Thames, and the artificial stream called the New River (q.v.): the Grand Junction Canal, too, passes through the south-western extremity of the county. Chalk, at a greater or less depth below the surface, forms the basis of the soil, which is various, but principally loam and clay, the former being met with in nearly all its gradations, more or less intermingled with flint or sand. The climate is mild and healthy. As a manufacturing county Herts does not stand high. Its agriculture has improved very much of late years, the quantity of barley and wheat grown being very considerable; immense quantities of hay, too, are sold off the land, and sent to London. Ware is the chief seat of the malting trade in the kingdom; Cheshunt, Waltham Cross, and Bishop-Stortford are famous for their rose-gardens, and in some districts watercress is extensively cultivated for the London market. Herts is almost entirely in the diocese of St Albans and in the South-eastern Circuit, and since 1918 has returned one member to parliament for each of its five divisions—Hemel Hempstead, Hitchin, Hertford, St Albans, and Watford. Many historical events are connected with the county: it was the scene, at Verulam near the present town of St Albans (q.v.), of contests with the Romans, and of the martyrdom of St Alban; in it, too, were fought three of the most important battles in England's history—the first in 1455, when Henry VI. was wounded and taken prisoner at St Albans by the Yorkists; again at St Albans six years later, when victory decided for the opposite party; and lastly in 1471, at Barnet, when the decisive battle was fought, in which the Lancastrians were utterly routed by the Yorkists. Rye House was the residence of Rumbold, one of the persons engaged in the alleged plot against the life of Charles II. Kings Langley, Hunsdon House, and Hatfield were royal residences, and at Theobalds James I. ended his days. Amongst the worthies of Herts mention may be made of Nicholas Brakespeare, afterwards Pope Adrian IV.; Francis Bacon, afterwards created Lord Verulam; Richard Gough, the antiquary; the poet Cowper; Bulwer Lytton; Charles Lamb; and John Leech. Hertford gave a title to a branch of the family of Seymour (q.v.; and see EDWARD VI.). See the 'Victoria History,' and Cussan's (1870-81).

Hertha (true reading in Tacitus, *Nerthus*), the North German deity identified with 'Mother Earth' to whom, according to some, the Hertha Lake in Rügen was sacred.

Hertogenbosch. See BOIS-LE-DUC.

Hertz, JOSEPH HERMAN, born at Rebrin, in Czechoslovakia, in 1872, went in childhood to New

York, and studied at Columbia University. He was rabbi at Syracuse (N.Y.) and at Johannesburg, but was expelled by President Kruger. In 1906 he became professor of Philosophy in Transvaal University College, and in 1912 returned to New York. In the next year he was made Chief Rabbi of the British Empire. His publications include *The Ethical System of James Martineau*, *The Jew in South Africa*, *The Place of the University in Modern Life*, and *A Book of Jewish Thoughts*.

Hertz, HEINRICH, physicist, was born 22d February 1857, at Hamburg, and studied at Berlin, where in 1880 he became assistant to Helmholtz. In 1883 he began to lecture in Kiel, in 1885 was called to the technical school at Karlsruhe, and in 1889 succeeded Clausius at Bonn. He greatly advanced the science of electricity, was the continuator of the work of Faraday and Clerk-Maxwell, and was a singularly ingenious experimenter. He died 1st January 1894. In the three volumes of his collected works (1894) the most important discussions are those on the relation of light and electricity, on the diffusion of electric force, and on the principles of mechanics. See the *éloge* by Planck (1894), *Lodge in Nature* for June 1894, and RADIUM.

Hertz, HENRIK, Danish poet, was born of Jewish parents in Copenhagen, 25th August 1798, and studied for the bar. *Gjengangrebrevne* ('Letters of a Ghost'), a rhymed satirical poem, created a sensation in 1830. His finest dramatic writings are *Spænd Dyring's Huns* (1837), a romantic drama; and *Kong René's Datter* (1845), a lyric drama (often translated into English—in 1850 by Sir Theodore Martin). He also wrote many lyrics (4 vols. 1857-62), a lyrical comedy, and a humorous novel. He died 25th February 1870.

Hertzog, JAMES BARRY MUNNIK, Dutch South African politician, born at Wellington, Cape Colony, in 1866, and educated at Stellenbosch and Amsterdam, was called to the bar, and in 1895 became a judge. He served as a Boer general from 1899 to 1902. Afterwards he held out against the moderate leaders, such as Generals Botha and Smuts. In 1907 he became attorney-general of the Orange River Colony and minister of education. He introduced the bilingual law into educational methods, and took office under Botha as first minister of justice to the Union of South Africa in 1910. Two years later, however, old bitterness breaking out, General Botha left him out of his reconstructed ministry. He became leader of the Nationalist Party. During the rebellion of 1914 he hesitated, and later he opposed South African co-operation in the War. In 1924, on the resignation of General Smuts, he became prime minister with a joint Nationalist and Labour cabinet.

Heruli, an ancient Germanic people, of unknown seat, associated with the Goths (q.v.) from the 4th century B.C.

Hervé, whose proper name was FLORIMOND RONGER, a musical composer, was born on 30th June 1825 at Houdain, near Arras. In 1848 he made his first appearance in an operetta composed by himself, *Don Quichotte et Sancho Pança*. Then, after officiating for three years as director of the orchestra at the theatre of the Palais Royal, he worked as singer, composer, director, and actor in various theatres. Some of his light operas have had very successful runs, such as *L'Œil Crevé*, *Chilpéric*, and *Le Petit Faust*. He died November 4, 1892.

Hervey, JAMES, author of *Meditations among the Tombs*, was born at Hardingstone, near Northampton, on 26th February 1714. The facts of his life are few. He was educated at Northampton and Lincoln College, Oxford, and was first curate and afterwards incumbent of Weston-Favel and Collingtree, both near Northampton. He died on

Christmas-day 1758. Hervey adopted a Calvinistic creed, and in the 18th century his works, though not distinguished by any extraordinary qualities, enjoyed great favour with the people. The best of them are *Meditations and Contemplations* (1746), including his most famous production, 'Meditations among the Tombs,' and also 'Reflections on a Flower Garden' and 'A Descant on Creation'; *Contemplations on the Night and Starry Heavens* (1747); and *Theron and Aspasio, or a Series of Dialogues and Letters on the Most Important Subjects* (3 vols. 1755). This last gave rise to the Sandemanian controversy as to the nature of saving faith. A complete edition of his works, with a memoir, appeared in 1797. See also his *Life and Letters* (2 vols. 1760).

Hervey Islands. See COOK ISLANDS.

Herwarth von Bittenfeld, KARL EBERHARD, Prussian general, was born in 1796, and gained his first laurels in the war of liberation, especially in the battle of Leipzig. In 1864, raised to the rank of general, he acquired great fame through his daring capture of the isle of Alsén. In the campaign of 1866 he was entrusted with the occupation of Saxony, and then with the command of the army which advanced from Saxony into Bohemia. He contributed largely to the brilliant victories of Hühnerwasser, Münchengrätz, and Königgrätz. In 1870, on the outbreak of the Franco-German war, he was made governor of the Rhine provinces, in 1871 a general field-marshal; and he died at Bonn, 2d September 1884. In the war of 1866 one of his sons fell; in that of 1870 two were killed.

Herz, HENRI, a pianist and composer for the pianoforte, was born of Jewish parentage at Vienna in 1806, and educated principally in Paris, where his talent was early recognised. His compositions became popular over Europe, and he was received with great applause on visiting England in 1834, and America in 1846. In 1837 he received the decoration of the Legion of Honour; and from 1842 till 1874 he was professor of Music at the Conservatoire of Paris. At the same time he managed a pianoforte factory, and in 1855 gained with his pianofortes the first prize at the Paris exhibition. His compositions, more than 200 in number, are mostly for the piano, and are characterised by melodic charm and a certain originality. He died 5th January 1888.

Herz, HENRIETTE, a lady of great beauty, high intelligence, and wide culture, and a Jewess, who, in the beginning of the 19th century, made her home at Berlin a gathering-place for the intellectual life of the city. Amongst those who either met in her salon or were in correspondence with her were the Humboldts, Fr. Schlegel, Gentz, Varnhagen von Ense, Rahel, Schleiermacher, and Börne. She was born at Berlin, on 5th September 1764, the daughter of a Jewish doctor of Portuguese origin, Benjamin de Lemos, and was married in 1779 to another doctor, Markus Herz. In 1817 she went over to Protestantism. She died on 22d October 1847. See her *Life* by Fürst (2d ed. 1858), and her correspondence with Börne (1861).

Herzego'vina. See BOSNIA.

Herzen, ALEXANDER, a Russian author, was born at Moscow, 25th March 1812. In 1834, while yet a student, he was imprisoned for his political opinions. From 1842 he published much, principally novels and political works. In 1847 he left Russia, and eventually established himself in 1851 in London. At this time his voice had great weight in influencing public opinion in Russia, chiefly by means of his paper *Kolokol*, of which thousands of copies were smuggled into

Russia, in spite of the government prohibition. But Herzen gradually lost his influence as he became more and more a party-man, and especially by his advocacy of the cause of the Poles at the outbreak of their rebellion in 1863. He died at Paris, 21st January 1870. Of his numerous works may be mentioned the novels *Who is to Blame?* and *Dr Krupoff*, and *From the Other Shore, Letters from Italy and France, Development of Revolutionary Ideas in Russia, Baptised Property* (Serfdom), and *The Social Condition of Russia*. Many of these appeared under the pseudonym of Iskander. He also edited *Mémoires de l'Impératrice Cathérine* (1859), and the works of Pushkin, Lermontoff, &c. His collected works appeared in Russian in 11 vols. at Basel, 1875 *et seq.* See his *Mémoires* (trans. Duff, 1923 *et seq.*; trans. Mrs Garnett, 1924 *et seq.*).

Herzog, JOHANN JAKOB, a theologian of the Reformed creed, was born at Basel, 12th September 1805, and, after studying at Berlin, became professor at Lausanne (1830), Halle (1847), and Erlangen (1854). He died 30th September 1882. Amongst his works are a book on the Plymouth Brethren (Lausanne, 1845), lives of Calvin and Ecolampadius, a work on the Waldenses, and a church-history; but his name is best known for the great theological encyclopædia edited by him, *Realencyklopädie für Protestantische Theologie und Kirche* (22 vols. Gotha, 1854-68); 3d ed. by Hauck (24 vols. 1896-1913); English abridged ed. by Schaff (3 vols. 1883-84); English edition based on 3d ed. (12 vols. 1908-12).

Hesiod, the earliest didactic poet of Greece of whom we have any knowledge, was born in Ascra, a small village at the foot of Mount Helicon. As he himself informs us, in his boyhood he tended flocks on the mountain. On the death of his father he became engaged with his brother, Perses, in a lawsuit as to the division of their patrimony. His brother bribed the 'kings' or judges, and thus gained unjust possession of the property, which, however, he soon dissipated. But Hesiod prospered, and when Perses in his poverty applied to him for aid Hesiod gave him the good advice which forms the larger part of his *Works and Days*. According to a passage (if genuine, 646-662) in the same poem, Hesiod attended the funeral games of Amphidamas at Chalcis, in Eubœa, and there recited a hymn of his composition which gained him the prize. It was probably for some such festival that he composed the *Theogony*. Where or how Hesiod died we do not know. The only data we possess for fixing the time at which Hesiod lived are those contained in his works, for although Herodotus makes Hesiod contemporary with Homer, he can have had no sufficient evidence to go upon. The poems of Hesiod show acquaintance with a wider geographical horizon, especially westwards, than do those of Homer; the language is in a later stage, the digamma more frequently neglected; and, finally, in Hesiod there are unmistakable imitations of Homer. We may therefore safely conclude that Hesiod was later than Homer—possibly belongs to the end of the 8th century B.C.

The *Works and Days* is generally considered to consist of two originally distinct poems, one containing the good advice to his brother, preaching up honest labour and denouncing corrupt and unjust judges; the other, the real *Works and Days*, containing advice as to the days lucky or unlucky, proper or improper, for the farmer's work. The *Theogony* teaches the origin of the universe out of Chaos, the creation of earth and hell, of night and day, sea and sky, sun and moon, and the history of the gods. Bœotian tradition denied that the *Theogony* was the work of Hesiod, but Herodotus affirms it (ii. 53), and the internal testimony and the

similarity of the language of the *Theogony* and the *Works and Days* confirms Herodotus. On the other hand, the *Shield of Heracles*, which has been preserved, and the *Catalogue of Women* and the *Eoæ*, which have not, were not genuine. The corrosive criticism which has been poured on the Homeric poems has also been applied to the Hesiodic; and here too the critics are not agreed whether the unity of the poems is the work of the original composer, and has been disturbed by interpolations, or is the work of some late editor harmonising lays originally unconnected. The dialect (Old Ionic) in which the Hesiodic poems are composed has also been attacked. Fick maintains that the *Theogony* was composed in the Delphic dialect, the *Works and Days* in ancient Æolic, and that they were subsequently rewritten in artificial Ionic.

Hesiod wrote not to please the imagination, but to improve the mind. Homer told tales, the tale of Troy, of Achilles, of Odysseus, 'lies like unto the truth,' as Hesiod would say. Hesiod's object was to tell the truth. His poetry is not very poetical, but it has its interest. In the first place, it is what the Greeks learned by heart as children and quoted as men for their moral guidance. In the next place, the *Works and Days* gives us an invaluable picture of the village-community as it existed in Greece in the 8th century B.C., and of the 'kings' of Homer as they appeared to the villagers. Finally, the *Theogony* is of the utmost importance to the comparative mythologist.

Hesperides, the sisters who, assisted by the dragon Ladon, guarded the golden apples which Hera had received, on her marriage with Zeus, from Gæa. Their genealogy and their number are variously given by mythologists. The gardens of the Hesperides were placed far in the west, on the verge of the ocean, or in the land of the Hyperboreans. The apples were stolen by Herakles, but were afterwards restored by Athena. See ATLANTIS.

Hesperis. See BENGASI, DAME'S VIOLET.

Hesperopithecus, a supposed early man (*H. Haroldcookii*)—or as some think a bear—represented by a single much-worn molar tooth from Nebraska, described in 1922.

Hesperornis, a remarkable extinct form of bird, the remains of which have been met with in the American Cretaceous deposits. As described by Professor Marsh, it possessed small pointed reptilian teeth, which were implanted in a deep

type than that of any adult bird as yet examined. It appears to have been a large diving-bird, measuring over 5 feet from the point of the bill to the end of the toes. Its wings were rudimentary, its legs powerful, and its feet well adapted for rapid progression in water. The tail was broad, could move up and down, and was probably used as a rudder or swimming-paddle. The long slender jaws were united in front only by cartilage, as in serpents, and had on each side a joint which admitted of some motion, so that 'the power of swallowing was doubtless equal to almost any emergency.' See ODONTORNITHES.

Hesperus, the Greek name (Lat. *Vesper*) for Venus as the evening star (see PLANET). Hence the Alexandrian grammarians called Italy, and sometimes all western Europe, *Hesperia*, 'the western land.'

Hesse (Ger. *Hessen*), or HESSE-DARMSTADT, a state (former grand-duchy) of Germany, between 7° 51' and 9° 39' E. long., and 49° 24' and 50° 50' N. lat. A strip of Hesse-Nassau divides it into a northern part, Oberhessen, completely enclosed by Prussia, and a southern part, comprising the two provinces of Starkenburg, east of the Rhine, and Rheinhessen, west of the Rhine. Besides these two main parts there are eleven enclaves in Baden and Prussia, the largest Wimpfen and Hohenstadt. Oberhessen is partly occupied in the east by the Vogelsberg, culminating in Taufstein (2532 feet), in the south-west by a ramification of the Taunus, the fertile and undulating valley of Wetterau lying between them. Starkenburg, in the south-east, is covered by the larger part of the Odenwald. The Bergstrasse divides the uplands of Starkenburg on the east from the plain of the Rhine on the west. This plain merges in the north into the plain of the Main. Rheinhessen, fertile and populous uplands, laid out largely in vineyards, the principal industry of the province, lies between the three points, Kreuznach, Mainz, and Worms. With the exception of the streams to the east of Vogelsberg draining into the Fulda, the waters of Hesse—Rhine, Main, Neckar, and Lahn—belong to the Rhine system. Of the total surface, comprising 3000 sq. m., 63 per cent. is tilled land and garden, and 31 forest. The most important products are corn—particularly in the Rhine and Main plains, and in Wetterau—pulse, potatoes, rape, poppy, tobacco, flax, fruit, and vines. Hesse yields iron, manganese ore, and peat. The industries—mainly in Mainz, Offenbach, and Worms—include the making of leather, boots, upholstery, tobacco, cigars, chemicals, &c. For an old Hessian trade, see MERCENARIES.

The total population amounted in 1875 to 882,349, in 1885 to 956,611, in 1910 to 1,282,219, in 1919 to 1,291,249. Of these about half belonged to Starkenburg. Two-thirds are Protestants, nearly a third Catholics, and 2 per cent. Jews. Mainz (q.v.) is the largest town; Darmstadt is the capital. Hesse has a university at Giessen, and a technical university at Darmstadt.

The Hessen were an ancient German tribe, and their territory came to be included in the principality of Thuringia. We first hear of the land-grave of Hesse in the 13th century. On the death of Philip the Magnanimous in 1567 the land-graviate of Hesse was quartered among his four sons, into Cassel, Marburg, Rheinfels, and Darmstadt. The House of Rheinfels becoming extinct in 1583, and that of Marburg in 1604, Hesse was reconstituted in two divisions—Hesse-Cassel and Hesse-Darmstadt. After the French Revolution Louis X., under pressure of France, signed a treaty of neutrality, and (1805-13) supplied Napoleon

Restoration of Skeleton of *Hesperornis regalis*:
a, tooth of do. with germ of second tooth (magnified).

continuous groove, somewhat like those of Ichthyosaurus. Its brain was small and more reptilian in

with a contingent of troops against the other Germans. In 1806 Louis assumed the title of grand-duke. In 1813, after the battle of Leipzig, Louis joined the allies, and in 1815 had to acknowledge the independence of Hesse-Homburg. In 1866 Hesse, having sided with Austria, had to yield up certain territories, including Hesse-Homburg, recently acquired, to Prussia. In 1820 a new constitution was set up, modified in 1856, 1862, 1872, and 1900. The grand-duchy became a republic in November 1918. The republican constitution dates from 1919. French troops occupied Rheinhessen in 1918, and parts of Starkenburg in 1918 and 1923.

Hesse-Cassel, till 1866 a German electorate, now forming the Prussian government district of Cassel. The landgraviate of Hesse-Cassel was formed by William IV., eldest son of Philip the Magnanimous, who died in 1567. Constituted an electorate in 1803, it was occupied by the French in 1806, incorporated with Westphalia in 1807, and reconstituted an electorate in 1813. The elector having joined Austria in 1866, Hesse-Cassel was incorporated with Prussia as part of the province of Hesse-Nassau (q.v.).

Hesse-Homburg, till 1866 a landgraviate of Germany, consisting of the lordship of Homburg vor der Höhe, on the right bank of the Rhine, and the lordship of Meisenheim, on the left bank. Area, 106 sq. m.; pop. then 25,000. Since 1866 Hesse-Homburg has been incorporated with Prussia, Homburg now forming part of the district of Hesse-Cassel, and Meisenheim of that of Coblenz. Hesse-Homburg was constituted a landgraviate in 1596. In 1806 Hesse-Homburg became again incorporated with Hesse-Darmstadt, but in 1815 was decreed independent, while it was enlarged by the addition of the district of Meisenheim. In 1866 Hesse-Homburg reverted to Hesse-Darmstadt; but the grand-duke, having espoused the cause of Austria in the seven weeks' war, was forced to surrender Hesse-Homburg to Prussia.

Hesse-Nassau, a province of Prussia, between Bavaria and Saxony on the east and the Rhine on the west, was formed (1867-68) out of parts of the former electorate of Hesse-Cassel, of the former duchy of Nassau, of the lordship of Homburg forming part of the former countship of Hesse-Homburg, of the larger part of the former free town of Frankfurt-on-the-Main, and small parts of Bavaria. It comprises 6000 sq. m. The surface consists mostly of uplands, contrasting with the Main plain and part of Wetterau in the south, and with the narrow valleys of the Werra and Fulda, and the fertile basin of the Schwalm in the north. The hills covering its surface include the Taunus and the Westerwald, rising to 2886 feet; the Hohe Rhön, rising in Grosse Wasserkuppe to 3096 feet; the Lahn Mountains, &c. The Thüringerwald traversing Schmalkalden culminates in the Inselsberg. Among the minerals are iron, copper, lead, manganese, and building-stone. It is rich in mineral waters, such as at Wiesbaden, Ems, Kronthal, Homburg, &c. The manufactures include gold and silver wares at Cassel, leather at Eschwege, damasks and other stuffs at Fulda, iron-foundries at Hanau, &c. The population in 1875 was 1,467,898; in 1919, 2,273,502. Over two-thirds are Protestants, over a fourth Catholics, 3½ per cent. Jews. It has over 100 towns, several, including Frankfurt, Cassel, Wiesbaden, Hanau, Bockenheim, Marburg, and Fulda, having more than 10,000 inhabitants each. Hesse-Nassau has a university at Marburg, and is duly furnished with gymnasiums, 'Real-' commercial, and higher schools, teachers' seminaries, deaf and dumb and

blind institutes. The principal occupations are agriculture, cattle-rearing, the usual industries, and mining.

Hessian Fly (*Cecidomyia destructor*), a dipterous insect, which in its larval state is one of the most important crop-pests, attacking stems of barley, wheat, and rye. The eggs are usually laid on the leaves twice a year, in May and September, and the larvæ, which hatch in a fortnight, bore into the stem, suck the juices, and destroy the plant. The larvæ turn to pupæ in the end of July, or in spring, and thence the flies develop in about ten days. The egg is very minute, about $\frac{1}{100}$ th of an inch, and pale red towards hatching. The larva or maggot has a shining, oval body, white or yellowish, with a soft fleshy head and twelve segments.

Hessian Fly (*Cecidomyia destructor*):

a, magnified; b, natural size; c, pupa cases ('flax-seeds') in different stages, natural size and magnified; d, barley stem, showing 'flax-seeds' in situ; e, stem elbowed down. (From Miss Ormerod.)

The mouth parts are very delicate, but near the hind end is a chitinous 'anchor process,' which is probably used as a digger or scraper. The pupa-cases, which are called 'flax-seeds,' are about $\frac{1}{10}$ th of an inch in length, of a long oval shape, and of a brownish or chestnut colour. The fly itself is a little stout-made black and brown gnat, about $\frac{1}{10}$ th of an inch in length.

The fly was first known as a scourge in North America during the years 1786 and 1789, and owes its name to the erroneous supposition that it was imported by the Hessian troops, mercenaries of Great Britain. In England it appeared in 1788, and was described by Sir Joseph Banks. 'It is now known to exist in the south of France, Austria, Hungary, and southern Russia, and its original habitat is considered most probably to have been southern Europe and Western Asia.' See CECIDOMYIA, CORN INSECTS.

Hestia, a Greek goddess of fire and the hearth, identified with the Roman Vesta (q.v.).

Hesychasts (Gr. *hēsychazein*, 'to be quiet'), a mystic and contemplative sect of the Greek Church in the 14th century, who may be described as the Quietists of the East. A Basilian monk, named Barlaam, a native of Calabria, in the course of a visit to the monasteries of Greece, observed among the monks of Mount Athos several practices and doctrines which he considered grievously reprehensible, but one in especial. Believing that in the soul lay hidden a certain divine light, which it was the office of contemplation to evoke, the monks withdrew at stated times to a retired place, seated themselves on the earth, and fixed their eyes steadfastly on the centre of the stomach (whence the sobriquet by which they were known, *omphalo-*

psychoi, 'navel souls'); and they averred that, after the allotted time of contemplation, a kind of heavenly light beamed forth upon them from the soul (whose seat, they held, was in that region), and filled them with ecstasy and supernatural delight. The monks were defended by Gregory Palamas, the Archbishop of Thessalonica; and councils in 1341 and 1351 pronounced in their favour. But the public voice was hostile to the sect, and they soon fell into obscurity. See Stein's monograph (Vienna, 1874).

Hesychius, a Greek grammarian of Alexandria, flourished probably towards the end of the 4th century A.D. He was the author of a Greek lexicon, containing words and phrases, obscure, rare, and dialectical, which, in spite of the corruption of the text, is one of the most useful books we have for understanding the works of the great classic writers of Greece.—**HESYCHIUS** of Miletus wrote a work on eminent Greek writers, and a universal history (mostly lost) down to 518 A.D.

Hetairai, or **HETÆRÆ** (Gr., 'female companions'), the courtesans of Athens, who enjoyed a social standing not elsewhere accorded to them, were often women of high culture, and exercised great influence. See **ASPASIA**, **LAIS**, **PHRYNE**.

Hetairists. See **YPSILANTI**.

Heterocera. See **MOTHS**.

Heterocercal (Gr. *heteros*, 'unequal,' and *kerkos*, 'tail'), Agassiz's term for the tail of Elasmobranch and most Ganoid fishes, in which the vertebral axis is bent upwards in the tail, making the upper lobe much the larger (see the article **STURGEON**). In bony fishes also the axis is somewhat bent upwards in its termination, but the asymmetry is disguised, and the tail looks equal-lobed or *homocercal*. In some Teleosteans and Ganoids, in a few Elasmobranchs, and in Dipnoi, the tail is genuinely symmetrical or *diphycercal*.

Heterogenesis. See **SPONTANEOUS GENERATION**.

Heterop'oda, pelagic Gasteropods, in which the 'foot' has become a swimming organ. In association with their active life on the surface of the ocean must be noted not only the locomotor foot, but the protective transparency, the highly-developed nervous system and sensory structures, eyes, ears, and smelling organ. The toothed ribbon in the mouth is also very elaborate. Technically the Heteropods are included among the Azygo-branchs. Atlanta, with a large visceral dome and shell; Carinaria, with a reduced hump and small cap-like shell; and Pterotrachea, without a hump or shell, are the three types. See **GASTEROPODA**, **MOLLUSCS**.

Heterop'tera. See **HEMIPTERA**, **WATER-BUG**.

Heterosporous Ferns, also called Hydropteridæ (water-ferns) and Rhizocarps, a group (probably artificial) differing from ordinary (homosporous) ferns in having two kinds of spores, of which the megaspore produces a small female prothallus, bearing archegonia, and the microspore a rudimentary male prothallus with an antheridium. There are two families, Marsileaceæ (genera Marsilea and Pilularia) and Salviniaceæ (genera Salvinia and Azolla). See **SALVINIA**.

Hetman, or **ATAMAN**, the name given to the supreme head of the Cossacks. The word is believed to be of Germanic origin, and identical with *hauptmann* and *headman*. See **COSSACKS**.

Hevea. See **INDIA-RUBBER**.

Hevelius (**HOVEL** or **HÖVELKE**), **JOHANN** (1611–87), astronomer, was born at Danzig. He was wealthy, and in 1641 he erected an observatory in his own house, and for forty years carried on astronomical observations. He laid down the results

of his observations in *Selenographia* (1647), *Cometographia* (1668), and *Machina Cœlestis* (1673; reprinted, with an English trans. by Prince, in 1832).

Heves, a town of Hungary, 60 miles ENE. of Budapest; pop. 10,000.

Hewlett, **MAURICE HENRY** (1861–1923), called to the bar in 1891, was keeper of Land Revenue Records (1896–1900), and made a name as author of *The Forest Lovers*, *Richard Yea-and-Nay*, *New Canterbury Tales*, *The Queen's Quair*, *Artemision*, *The Song of the Plow*, *Flowers in the Grass*, and other romances, poems, and essays. *The Agonists* (1911), a drama, was described as 'a trilogy of gods and men.'

Hexachord, in modern music, denotes the six diatonic degrees of which Guido formed his scale. See **GUIDO**, and **SCALE**.

Hexameter, the name applied to the most important form of classical verse. It is the heroic or epic verse of the Greeks and Romans, the grandest examples of which are the *Iliad* and *Odyssey* in Greek, and the *Æneid* in Latin. It consists, as its name implies, of six feet or measures, the last of which must be a spondee (a measure composed of two long syllables), and the penultimate normally a dactyl (one long syllable and two short). If the penultimate is also a spondee, the verse is said to be spondaic. Klopstock, Goethe, and Voss produced notable hexameter verse in German. Longfellow's *Evangeline*, Kingsley's *Andromeda*, and Clough's *Bothie of Tober-na-Vuolich* and *Amours de Voyage* are the best-known specimens in English—the *Bothie* being very rough and shambling. The following lines from the last show the only varieties of the hexameter which are endurable to the ear—i.e. those in which the accent on each foot falls on its first syllable:

Fēit shē in | mýrīād | springs hēr | sōurcēs | fār in thē | moūn-
tāins,
Stīrring, cōl | lēcting, | hēaving ūp, | rīsing, | fōrth oūt | fōwing.

It will be observed that on whatever syllable here the metrical accent falls, that syllable is precisely the same which the voice naturally accentuates. Whether this was the case in ancient Greek and Latin hexameters we do not know, but, if the present system of Greek accentuation represents the natural accent of Homeric words, it is certain that Homer disregarded the natural accents, or did not observe our rule of always placing the metrical accent on the first syllable of each foot; and we still pronounce Latin hexameters by preserving what we take to be the natural accent of each word, whether that corresponds to the metrical accent or not. Thus in the line

Itali | am fá | to prófu | gus La | vīniasque | vēnit

we disregard the metrical accent, which should fall on the first syllable of each foot (and actually does so in the fifth and sixth), and in reading the line give effect to the natural accents only, as we conceive them, of the words *Italian*, *fate*, *profugus*. When English hexameters were first written they were constructed in the same manner; they were to be read in the same way as Latin hexameters. The natural accent, except in the last two feet, overruled the metrical. In the following lines from Stanihurst's translation of the *Æneid* it will at once be seen that the effect is absurd if we read the lines as modern English hexameters are read:

Either here | are couch | ing some | troops of | Greekish as |
sembly,
Or to crush | our bul | warks this | work is | forged, all | houses
For to pry, | surmount | ing the | town; some | practice or |
other
Here lurks | of cun | ning; trust | not this | treacherous |
ensign.

If we read by the natural accent the effect is rough and harsh to the ear; if by the modern metrical,

ridiculous and absurd. Such are the limitations of the hexameter in English.

Hexapla (Gr. *hexapla*, 'the sixfold'), a celebrated edition by Origen of the Old Testament Scriptures, consisting of the Hebrew text, with a transcript in Greek letters, the Septuagint, and the versions of Aquila, Symmachus, and Theodotion. It is no longer extant. See ORIGEN, SEPTUAGINT.

Hexham, an ancient town of Northumberland, beautifully situated on the right bank of the Tyne, 24 miles W. of Newcastle by rail. A stone bridge of nine arches spans the river, and the town is intersected from east to west by one long street, called in its different parts by the names of Priest-poppo, Battle-hill, and Hencotes. Two narrow streets connect with the market-place, one of the most interesting and picturesque in England, from which again other narrow streets diverge irregularly. The Abbey Church of St Andrew is a noble monument of 13th-century architecture, of which the greater part of the choir, except the eastern chapels, and both the transepts alone remain, the building having been subjected to shameful restoration. The monastery was originally founded by St Wilfrid in 674, and his church was long celebrated by the chroniclers as the finest on this side the Alps. Here in 681 a bishopric was established which lasted till 821, when Tidferth, the last bishop, died on a voyage to Rome, having been driven off by the Danes. The ruined church was rebuilt in 1112, and a priory of Austin canons founded, but the monastery was suppressed under Henry VIII., and its last prior hanged at Tyburn for taking part in the Pilgrimage of Grace. The nave of the church was destroyed by the Scots in 1296, and was never rebuilt. Under its ruins was discovered the Saxon crypt of St Wilfrid, a wonderful survival of our earliest architecture, with strange barrel vaults, lamp niches, and funnel-shaped apertures, only to be matched at Ripon. It has been discovered that it was built of Roman stones, most likely carried from the old Roman station of *Corstopitum*, but $3\frac{1}{2}$ miles distant. The central tower is 100 feet high, and of its eight ancient bells one is still called the 'Fray Bell,' from having been rung to give warning in Border alarms. The stone Frith-stool is supposed to have been Wilfrid's chair. The best remains of the monastery are the refectory and the abbey gateway of Norman architecture. To the west of the churchyard is the Seal, once the park of the monks, now a public promenade. Near Hexham the Lancastrians were severely defeated, May 15, 1464. The manufacture of gloves was once important. Pop. (1871) 5331; (1901) 7071; (1911) 8417; (1921) 8849.

See the admirable and sumptuous work by Charles Clement Hodges, *The Abbey of St Andrew, Hexham* (privately printed, 1888); and *Hexham and its Abbey* (1919), by C. C. Hodges and Gibson.

Heyden, JAN VAN DER (1637-1712), Dutch landscape and architectural painter, born at Gorkum.

Heylin, PETER, an English divine of considerable note in his own day, was descended from an ancient Welsh family belonging to Montgomeryshire, and was born at Burford, in Oxfordshire, 29th November 1599. He studied at Oxford, where he took the degree of D.D. Through the interest of Laud (q.v.) Heylin was appointed chaplain-in-ordinary to King Charles in 1629. He was deprived of his livings under the Commonwealth; but after the Restoration was made sub-dean of Westminster. He died 8th May 1662. Heylin was a very voluminous controversial writer on the anti-Puritan side, and wrote cosmographies, histories of England, of the Reformation, and of the Presbyterians. See FULLER (THOMAS).

Heyne, CHRISTIAN GOTTLÖB, a German classical scholar, was born at Chemnitz, in Upper Saxony, 25th September 1729, the son of a poor weaver. In spite of extreme poverty and often absolute hunger, Heyne struggled perseveringly at Leipzig; and in 1753 he obtained the situation of under-clerk in the Brühl library at Dresden. An edition of *Tibullus* and one of the *Enchiridion* of Epictetus, which he published about this time, gained for him the patronage of the celebrated scholar, Ruhnken of Leyden. But the outbreak of the Seven Years' War threw Heyne out of employment, and for some time he led a precarious life, being often without bread, and supporting himself as best he could by writing for booksellers. But in 1763, on the recommendation of Ruhnken, he was appointed professor of Eloquence at Göttingen, and the rest of his long life was spent in comfort and professional activity. By his lectures and the thorough knowledge he displayed of all departments of ancient Greek and Roman life, he was chiefly instrumental in raising Göttingen to its pre-eminent position as a school of classical study. He is said to have trained more than 130 professors. Heyne died 14th July 1812. His principal works, besides those mentioned, are his editions of Virgil (1767; new ed. 1830-44), Pindar (1773), Apollodorus (1782), and Homer's *Iliad* (3 vols. 1802); numerous translations; six volumes of *Opuscula Academica* (1785-1812); and about 7500 reviews of books in the *Göttinger Gelehrte Anzeigen*, of which he was editor from 1770. Compare the Life of Heyne by his son-in-law, Ludwig Heeren (1813), and Carlyle's essay in vol. ii. of the *Miscellanies*.

Heyse, PAUL JOHANN LUDWIG (VON), German poet, dramatist, and novelist, was born in Berlin on 15th March 1830, and educated at Berlin and Bonn. He was one of the band of writers whom King Max of Bavaria gathered around him in Munich in 1854. As a writer of short stories he soon became an acknowledged master, his work being mostly of the nature of genre-pictures in words, marked not so much by powers of character-drawing as by executive skill and fertility of invention, artistic attention to details, a graceful style, sly humour, and sometimes sensuality. He published more than a score of collections of *Novellen* under various titles, for example, *Das Buch der Freundschaft* (1883-84). He opposed the contemporary realistic school. His poetic works include narrative poems, such as *Urica* (1852), and epics, such as *Die Braut von Cypern* (1856) and *Thekla* (1858). In his dramas (some fifty in number) he showed the same amazing fertility and industry as in his short stories, but with less success. He also wrote several more ambitious novels, *Die Kinder der Welt* (1873), *Im Paradiese* (1875), *Ueber allen Gipfeln* (1895), &c., besides reminiscences (*Jugenderinnerungen*, 1900), and critical works. He translated Leopardi and other Italian poets. In 1910 he was ennobled and was awarded the Nobel prize for literature. He died on 2d April 1914.

Heysham, a port on Morecambe Bay, 5 miles SW. of Lancaster, opened for traffic with Ireland and the Isle of Man by the Midland Railway in 1904; pop. 5000.

Heywood, a municipal borough of Lancashire, 3 miles E. of Bury and 9 N. of Manchester. It is connected with the Rochdale Canal by a branch canal. Incorporated in 1881, Heywood increased with great rapidity, both in population and wealth, partly in consequence of extensive coal-mines in the neighbourhood and partly in consequence of the enterprise of the Peel family, who introduced there the cotton manufacture. Iron and brass founding, boiler making, and the manufacture of cotton, woollens, machinery, railway plant, and chemicals are carried on. Pop. 27,000.

Heywood, JOHN, dramatist and epigrammatist, was born in London about 1497. After his studies at Oxford he was introduced at court by Sir Thomas More, and soon made himself by his merry wit and his skill in music a favourite with Henry VIII., and later with Mary. He was a devout Catholic, and in Elizabeth's reign betook himself to Malines, and afterwards to Antwerp and to Louvain, where, probably, he died about 1578. He is best known as a writer of interludes. The name had hitherto meant short dramatic pieces performed in the intervals of a banquet or court-pagant, in which the characters were merely personified qualities, or little more, but Heywood, influenced by French farce, introduced the novelty of making these individual persons represent classes, as the Pedlar, the Pardoner, and the like, instead of Youth, Felicity, &c. His interludes thus form an important stage between the old moralities and the modern drama. Among them are *Johan, Tyb his wife, and Sir Johan the preeste*; *A Merry Play betwene the Pardoner and the Frere, the Curate and Neighbour Pratte*; and *The Play called the four P's, a new and very Merry Interlude of a Palmer, a Pardoner, a Poticary, and a Pedlar*. His three collections of *Epigrams* reach the number of six hundred. His longest work is the wearisome allegorical poem, *The Spider and the Fly*, in which the relative merits of Catholics and Protestants are contrasted. See books by A. W. Reed (1917, 1918) and R. W. Bolwell (1922); Bang in *Englische Studien* (xxxviii.); and F. S. Boas in the *Cambridge English Literature* (vol. v. 1910).

Heywood, THOMAS, dramatist and actor, a Lincolnshire man, was educated at Cambridge. He seems to have been writing plays as early as October 1596; and on 25th March 1598 he was regularly engaged by Philip Henslowe as an actor. Of all the old dramatists he was the most prolific. We learn from the preface to *The English Traveller* that down to 1633 he had 'had either an entire hand, or at the least a main finger,' in the composition of 220 plays; and he continued for some years after that date to write for the stage. He was also the author of an historical poem, *Troja Britannica* (1609, folio); an *Apology for Actors* (1612); *Nine Books of Various History concerninge Women* (1624); a folio of nearly five hundred pages, which was planned, written, and printed within the space of seventeen weeks; a long poem, with learned and curious annotations, *The Hierarchie of the Blessed Angells* (1635, folio); a volume of rhymed translations from Lucian's *Dialogues*, Erasmus, Ovid, &c.; various mayoralty pageants, and divers tracts and treatises. His projected *Lives of all the Poets, Modern and Foreign*, was unfortunately never published. In 1624, and again in 1635, he refers to this work; and we know from Richard Brathwait's *Scholar's Medley* that he was engaged upon it as early as 1614. *The Life of Ambrosius Merlin* is one of several works published in 1641. In August of that year he was buried at St James's, Clerkenwell. See Professor Katharine L. Bates's edition of *A Woman killed with Kindness*, &c. (1919).

Twenty-four of Heywood's plays have come down. The best is *A Woman killed with Kindness* (1607), a pathetic tragedy of domestic life; and with this may be coupled *The English Traveller* (1633), which contains some admirable scenes, but ends somewhat abruptly. Heywood was particularly successful in depicting blameless English gentlemen, such characters as Master Frankford in the earlier play and young Geraldine in the later. His work is usually distinguished by naturalness and simplicity; but he wrote at the beginning of his career one absurdly grandiose play, *The*

Four Prentises of London, printed in 1615, which was parodied in Beaumont and Fletcher's *Knight of the Burning Pestle*. In the two parts of *The Fair Maid of the West* (1631), and in *Fortune by Land and Sea*, partly written by William Rowley and first printed in 1655, he gives us some spirited descriptions of sea-fights. *The Fyve Mayde of the Exchange* (1607), a sentimental comedy, has a very improbable plot; *The Rape of Lucrece* (1608) is chiefly noticeable for its songs; *Love's Maistrasse* (1636), dealing with the story of Cupid and Psyche, is fanciful and ingenious; and there is much tenderness in *A Challenge for Beautie* (1636). In the *Four Ages*—*The Golden Age* (1611), *The Silver Age* (1613), *The Brazen Age* (1613), and the two parts of *The Iron Age* (1632)—Heywood dramatised classical mythology, 'from Jupiter and Saturn to the utter subversion of Troy.' These plays are undeniably tedious, but contain some charming poetry. *The Late Lancashire Witches* (1634), written in conjunction with Richard Brome, is largely of a farcical character; and *The Wise Woman of Hogsdon* (1638) exposes the trickeries of fortune-tellers. In *The Royall King and Loyall Subject* (1637) the doctrine of passive obedience to kingly authority is carried to extreme lengths. The early plays, *Edward IV.* (2 parts, 1600) and *If You know not Me You know No Bodie*; or, *the Troubles of Queen Elizabeth* (1605-32), are of small account; nor can much be said in favour of *A Mayden-Head Well Lost* (1634). *The Captives, or the Lost Recovered*, an interesting play acted in 1624, was first published in 1885 from Egerton MS 1994 (Bullen's 'Old Plays,' 1st series, vol. iv.). A collection of Heywood's plays, in six volumes, was issued in 1874 (London, John Pearson). In tragic power he was deficient, but his gentleness and sincerity endear him to students.

Hezekiah (Heb. *Hiskiah*, *Yehiskiyahu*, 'May Jehovah strengthen him'), a reforming king of Judah, son and successor of Ahaz, reigned from c. 728 to c. 697 B.C. His reign is remarkable for the invasions by the Assyrians under Sargon, and again under Sennacherib. When Sennacherib appeared before Jerusalem 'an Angel of the Lord' (explained variously to mean the plague, an earthquake, a sudden attack by Tirhaka, or the simoom) slew during one single night 180,000 men in the Assyrian camp, and Sennacherib was obliged to retreat. (See 2 Kings, xviii.-xx., and 2 Chron. xxix.-xxxii.) The events of this period as recorded in Assyrian records are treated at Assyria (q.v.). After the war he collected great treasures and executed many highly useful works, among which the aqueducts of Jerusalem (q.v.) take a foremost place. His was also the golden age of prophetic poetry. He was succeeded by his son Manasseh.

Hiawatha (*Hai-en Wat-ha*), a chief of the Unondaga clan of North American Indians. He founded the remarkable confederation known as the Great League, made up from the Six Nations of the Long House. He was the great lawgiver of the forest, and is looked upon as the incarnation of human progress. Time has inclined to make a legend out of an actual personality.

Hibbert Lectures, a foundation instituted by the trustees of Robert Hibbert (1770-1849), a West India merchant. For many years the trustees applied the funds mainly to the higher culture of students for the Unitarian ministry, but in 1878 resolved to institute Hibbert Lectures, with a view to capable and really honest treatment of unsettled problems in theology, apart from the interest of any particular church or system. Amongst the lecturers have been Max Müller, Page Renouf, Renan, Rhys Davids, Kuenen, Beard, Reville, Pfeiderer, Rhys, Sayce, and Hatch.

Hibernation (Latin, *hibernare*, 'to pass the winter'), a peculiar physiological condition into which some mammals, such as hedgehog and dormouse, pass in times of scarcity and cold. It resembles the aestivation which a few mammals (e.g. the tenrec, *Centetes ecaudatus*, of Madagascar) exhibit in warm countries in times of great heat and drought; but very little is known of this 'summer-sleep.' Hibernation is also comparable to the various states of dormancy, lethargy, and coma exhibited by cold-blooded animals, but it is perhaps useful to restrict the term to the warm-blooded mammals. It is not exhibited by birds, who elude by migration the practical problems raised by the scarcity and cold of the winter.

Occurrence of Hibernation.—The capacity for winter-sleep is a physiological adaptation, and an inquiry into its sporadic distribution among mammals shows that it does not occur when other ways of meeting the winter are available. The mole belongs to the same order as the hedgehog, and both are largely insectivorous. But the mole does not hibernate, whereas the hedgehog does. Part of the reason is probably that the mole, differing from the hedgehog in being a burrower, can get beyond the frost's grip, and has food-supplies (such as earthworms) which are not available except under the ground. Similarly, reasons may be found why shrews need not hibernate, while bats must. Or an intelligible contrast may be made between true squirrels, rabbits, hares, lemmings, water-voles, porcupines, beavers, ermine, foxes, which do not hibernate, and ground-squirrels, true marmots, dormice, hamsters, Canadian jumping-mice, racoons, skunks, and spiny ant-eaters, which do. It seems probable that the capacity for winter-sleep is an adaptive capacity, which arose as a physiological variation, and became established in the course of natural selection. It is not an inevitable direct result of cold and scarcity operating on certain constitutions. An interesting point is that polar mammals do not illustrate winter-sleep, for the hibernation of a warm-blooded animal ends fatally if the exposure to very low temperature is very prolonged. The polar mammals have thick fur and accumulations of fat, or they migrate, and so on, but none of them (not even the polar bear) is a winter-sleeper. There is good reason to believe that hibernation is primarily adaptive to scarcity of food, and secondarily to cold. Thus mammals that make stores of food are never continuous hibernators, but sometimes have an interrupted winter-sleep, and display a good appetite in their waking intervals. Moreover, by cutting off supplies it is possible to send a hibernator asleep as early as August, as Horvath did with one of his *sousliks* (*Spermophilus*).

Degrees of Hibernation.—There is considerable diversity in the duration and the depth of the winter-sleep, but there has been a tendency to exaggerate its continuousness. Bats sometimes sleep for months without known interruption, but careful study of some species has shown that there is a good deal of creeping about within their retreats, and they are occasionally seen flying in winter in Britain. Similarly, the true marmots (*Arctomys*) may sleep for six months on end, buried deep in their burrows, but cases are recorded of repeated awakenings in the course of the winter. The hedgehog is one of the best examples of profound hibernation; the dormice are true hibernators that sleep lightly. The same kind of animal may exhibit different degrees of hibernation in different localities and seasons, and it is difficult, without more data, to discriminate between cases of drowsy inactivity (such as is circumstantially described for human beings in very cold countries) and true hibernation, which has definite physiological characteristics.

Characteristics of Hibernating Mammals.—It may be said that those mammals which hibernate differ from ordinary mammals in being imperfectly warm-blooded (or stenothermal)—that is to say, they are not able to keep the temperature of the blood constant. Even in their summer activity they may show, as the porcupine ant-eater does, an unusual variability of body-temperature, and it seems that in the ordinary nocturnal or diurnal sleep in the summer the hibernators reveal the interesting fact that the thermotaxic arrangements are not working rightly, that is, as they do in non-hibernating mammals, and there is a considerable drop in body-temperature. But the absence of hard-and-fast lines may be inferred from the fact that in some non-hibernating mammals, such as man, there is a slight fall of temperature in ordinary sleep. In the hibernators there is a partial relapse towards the cold-bloodedness of reptiles and the like (poikilothermal), which approximate in their temperature to that of the surrounding medium. This leads to a recognition of a second characteristic of hibernating mammals, that they seek out retreats (hibernacula), or bury themselves in the ground, or get into confined quarters, such as hollow trees, or surround themselves with non-conducting materials. The result is that the temperature in the immediate vicinity of the sleeper, to which its body-temperature approximates, is much higher than that of the outer world. Exposure to the extreme cold of the outer world would first waken the sleeper, and then, if prolonged, kill it. For with the lapse of warm-bloodedness the body-temperature rapidly sinks, and the tissues freeze fatally. In the third place, the hibernating capacity is significantly associated with a tendency to deposit fat, in part beneath the skin, as is usual, but also in special places, such as the walls of the chest, the arm-pit, the loins. The so-called 'hibernating gland' is no gland at all, but a mass of fat traversed by blood-vessels. It is this stored fat that ensures during hibernation the essential minimum of animal heat. Experiments show that, in some cases, a captive hibernator prevented from accumulating fat will not go to sleep, while one with an extra amount of fat will go to sleep earlier than usual.

The State of the Body during Hibernation.—The stoppage of nutrition is associated with an all-round reduction of the metabolism of the body. The ordinary functions are slowed down—the heart-beats are greatly reduced in number; the circulation is sluggish; the breathing movements may wholly cease in profound hibernation, or may be weak and at long intervals; the output of carbon dioxide is minute or absent, though there may be an accumulation in the blood; excretion is practically at a standstill; the fat is consumed away; some of the tissues, as Carlier has shown for the hedgehog, are different from their summer condition; there is an increase in the excitability of the muscles, especially of the left side of the heart, and the temperature sinks to near that of the immediate surroundings. Pembrey and Hale found hibernating dormice with a temperature of $9^{\circ}\text{--}14^{\circ}\text{.}5\text{ C.}$ instead of the normal $31^{\circ}\text{--}36^{\circ}\text{ C.}$; and Mares found bats in a grotto at Maestricht with a temperature of $7^{\circ}\text{--}7^{\circ}\text{.}2\text{ C.}$ when the external temperature was $6^{\circ}\text{.}4\text{--}7^{\circ}\text{.}7\text{ C.}$ Horvath found that zizels confined in a room at 2° C. had that body-temperature. In connection with the suspension of respiration in the profound sleepers, it may be noted that they can be immersed for many minutes in water or in poisonous gas. The hibernating hedgehog has been kept under water without injury for $22\frac{1}{2}$ minutes; and, according to Spallanzani, hibernating bats and marmots can survive four hours' exposure to carbon dioxide. The cessation of breathing movements and

of exchange with the outer world does not imply that there is not some exchange of gases in the lungs, or that the distinction between arterial and venous blood disappears.

Theory.—The hibernating capacity, taken in the strict sense, is to be regarded as an adaptive physiological peculiarity of a few mammals, and there is much to learn in regard to its nature; but there seems good reason for believing that the primary feature is a regularised collapse of the thermotaxic adjustments (perhaps dependent on a heat-regulating centre in the brain) when scarcity pulls the trigger. The attempt to continue being warm-blooded or stenothermal is abandoned, and though in the course of mammalian evolution variations in this direction have probably enough been repeatedly fatal to those that tried them, the relapse to relative cold-bloodedness or poikilothermy has proved eminently successful in other types which had also varied in the direction of laying up reserves of fat and of seeking out shelters from the cold. This problem of historical origin is likely to remain untouched save by speculation, but experiment will probably throw light on the nearer problem of the immediate causes of the winter-sleep, and on the not less interesting problem of the re-awakening. As to the inducing of sleep, it has been pointed out that the relapse to relative cold-bloodedness (the poikilothermal condition) means a depression of vitality, a sluggish circulation, a lowered blood-pressure, a reduction of excretion, and a probable auto-intoxication of the system, as Errera insists, with its own waste-products. Or, to lay emphasis on one kind of waste-product, it may be that the accumulation of carbon dioxide in the blood, well marked in the American marmot, first induces narcosis, and later a hyper-excitability of the muscular tissue, and finally—after a certain limit is passed—a toxic excitement, accompanied in some cases by demonstrable rise of temperature, which awakens the respiratory centres and the whole creature as well. When the hedgehog awakens from its profound winter-sleep there is a quick rise of temperature, which is directly due to a rapid combustion of glycogen along with a small quantity of fat. Horvath's observation that the rise of temperature in an awaking zibel (*Spermophilus citellus*) occurs, although there is no rise in the temperature of the surroundings, has been confirmed.

Analogous Conditions.—Often included under the title hibernation are various states of dormancy, coma, or lethargy exhibited by cold-blooded animals in times of scarcity and cold, or it may be drought and great heat. This is illustrated by some tortoises, which bury themselves in the ground; by some lizards, which lie motionless with no perceptible breathing (the British viviparous lizard is said to lie dormant for nine months of the year at Archangel); by frogs, which lie buried in the mud, not asleep in any strict sense, but with mouth shut, nostrils shut, eyes shut, breathing cutaneously, and with the heart beating feebly; and by some fishes, for instance, of the carp and eel families, which burrow into the mud at very low temperatures (5° C.), and become extremely lethargic. These cases have in common a marked reduction of the rate of metabolism, a cessation of ordinary activities, and a consumption of reserves of fat and the like, but there are considerable differences in the various types. These differences increase when we include the dormancy of backboneless animals. Thus the Roman snail makes a hole in the ground in a sheltered place, and goes to rest with the mouth of the shell upwards, but closed with a calcareous lid and several membranous ones within. For nearly six months it may remain inert; the heart beats twice or thrice a minute instead of the fifty times observed in

summer, the respiration is a slow diffusion, the glycogen stored in the liver is used up, there is also a consumption of fat, and some of the tissues are considerably changed. Thus the cilia of the cylindrical cells lining the alimentary canal disappear, and the nuclei of these cells become poorer in chromatin. In dry cold it can be kept continuously asleep for twenty months. Familiar illustrations are to be found among insects, where the winter may be passed in the larval, pupal, or even adult stage. The series passes gradually into cases where a quiescent stage occurs in the course of the life-history without any present-day relation to scarcity or temperature.

Hibernia. See IRELAND. The Hibernian School, of the type of the Royal Military Asylum (q.v.), was abolished in 1924.

Hibiscus, a genus of plants of the natural order Malvaceæ, the type of a tribe or sub-order distinguished by an epicalyx and fruit of three or more many-seeded carpels united into a many-celled capsule. The species are numerous, natives of warm climates, some of them trees or shrubs, but most of them large herbaceous plants, annual or perennial. The flowers of many are very beautiful; in the South Sea Islands they are much used for personal adornment. *H. syriacus*, sometimes but erroneously called *Althæa frutex*, a native of western Asia, has long been in cultivation as an ornamental shrub, and proves sufficiently hardy in many parts of Britain. Many are favourite hothouse plants. The characteristic mucilaginous and fibrous properties of the Malvaceæ are very strongly developed in this tribe. The fruit of *H. esculentus* (or *Abelmoschus esculentus*) is in general use both in the East and West Indies as an article of food; its name in the West Indies is Gobbo. It is an annual plant, with a soft herbaceous stem, 3 to 5 feet high, crenate leaves, axillary sulphur-coloured flowers, and pyramidal, somewhat pod-like capsules. It is cultivated in some parts of the south of Europe. The fruit is used in an unripe state.

It is generally much esteemed, but is disliked by some on account of its viscidty. It enters, as an important ingredient, into the *pepper-pot* of the West Indies. The ripe seeds are sometimes used in soups as barley. The

Hibiscus esculentus, upper part of a flowering plant:

a, unripe fruit; b, section of do.
(Bentley and Trimen.)

bark of *H. tiliaceus*—a tree 20 feet high, with a very thick bole—so abounds in mucilage that by chewing it the natives of the South Sea Islands obtain nourishment in times of scarcity. This tree is one of the most abundant trees of the South Sea Islands; and the wood, being light, tough, and durable, is much used for many purposes. From its fibre the Tahitians manufacture matting fine and coarse, the latter for sleeping upon, the former for protection from wet during the rainy season, and they also make ropes and twine of the same. The bark is very fibrous, and cordage and matting are made of the fibre in various tropical countries. Many other species yield fibres, some of them coarse, some of them fine and beautiful, which are used in different countries; but the most important in this respect is *H. cannabinus*, the Deccan Hemp of western India (see FIBROUS SUBSTANCES). *H. sabdariffa* is very generally cultivated in warm countries, on account of its calyx, which, as the fruit ripens, becomes fleshy, and acquires a very pleasant acidity. It is much used for making tarts and jelly, and a decoction of it, sweetened and fermented, affords a refreshing beverage, well known in the West Indies as *Sorrel Cool Drink*, the plant being called Red Sorrel; and in the Madras territories it is used for similar purposes, and is named *Rozelle* or *Rouselle*. *H. Abelmoschus* (or *Abelmoschus moschatus*), sometimes called Musk Seed, another plant common in widely separated tropical countries, is cultivated for its seeds, which have a fragrance between that of musk and that of amber. They are much used by perfumers, and are called *Ambrette* or *Graines d'Ambrette*. In Egypt and Arabia they are mixed with coffee, and stimulant and stomachic qualities are ascribed to them. The petals of *H. Rosa-Sinensis* possess astringent properties, and they are also used by the Chinese to stain their eyebrows and their shoes black.

Hiccup, or HICCUGH, is caused by an involuntary contraction of the Diaphragm (q.v.), while the glottis is spasmodically closed. The inward current of air through the narrowed aperture, and its sudden arrest when the glottis closes, cause the characteristic sound. Usually the paroxysm only lasts for a few minutes, but it may sometimes extend to hours or days. The most common cause of hiccup is some disordered condition of the stomach. Very obstinate hiccup sometimes occurs in various diseases, especially fevers and diseases of the lungs and liver; and may be a very serious complication in consequence of the exhaustion it produces. Sometimes it has a nervous origin.

When the attack is slight it may often be stopped by making a very full inspiration, and then holding the breath as long as possible, the diaphragm being thus kept in a state of voluntary contraction. A draught of cold water, a start or blow, or strong pressure round the waist will sometimes give relief. In more obstinate cases a combination of camphor or of opium with chloroform, and the frequent swallowing of small rounded pieces of ice, are perhaps the most efficient remedies. Bismuth, nuxvomica, bromide of potassium, and many other drugs have also been recommended.

Hickes, GEORGE, nonjuror and philologist, was born at Newsham, Yorkshire, June 20, 1642. He studied at Oxford, in 1664 was elected Fellow of Lincoln College, and in 1666 took holy orders. In 1676 he became chaplain to the Duke of Lauderdale, whom he accompanied to Edinburgh. In 1678 he received the degree of D.D. from the university of Glasgow, and next year from Oxford. In 1682 he was appointed one of the king's chaplains, and the following year made Dean of Wor-

cester. Refusing at the Revolution to take the oaths to King William III., he was deprived of all his benefices. In 1693 he was sent with a list of the nonjuring clergy to the exiled king at St Germain, and in 1694 was consecrated by a prelate of his own party Suffragan Bishop of Thetford. His publications in controversial and practical divinity are numerous. His greatest work, entitled *Thesaurus Grammatico-Criticus et Archæologicus Linguarum Veterum Septentrionalium*, appeared at Oxford in 1705, 3 vols. fol., and in 1689 he had published a grammar of Anglo-Saxon and Mæso-Gothic. He died December 15, 1715.

Hickory (*Carya*), a genus of trees formerly included among Walnuts (*Juglans*). The hickories are exclusively North American. They are large and beautiful trees, attaining a height of 70 or 80 or even 100 feet, with pinnate compound leaves. The timber of all of them is very heavy, strong, and tenacious, but decays speedily when exposed to heat and moisture, and is said to be peculiarly liable to injury from worms. Great quantities of hickory are used to make hoops for casks. It is much used for handspikes, and shafts of carriages, handles of axes and golf-clubs, large screws, &c. are made of it. It is greatly esteemed for fuel. The nuts of some of the species are excellent eating, and in flavour resemble walnuts. They are enclosed in husks which split up into four equal valves; the surface of the nut is smooth, with four or more ridges running lengthwise, and meeting, especially in *C. sulcata*, in sharp points at either end.—*C. alba*, the Shell-bark or Shag-bark Hickory, so called from its shaggy outer bark, which peels off in long narrow plates, yields the common *hickory-nut* of the northern parts of the United States. The trunk is slender, and the tree occasionally reaches a height of from 80 to 100 feet. Its compound leaves are often 20 inches long. The nuts have a delicious flavour, and are in considerable request. The shell is thin but hard, the kernel sweet.—*C. sulcata*, the Shell-bark Hickory of the West, is a very similar tree, found from Pennsylvania to Wisconsin.—*C. oliviformis*, a western and southern species, yields the well-known Pecan Nut—in which the internal partitions common to the other hickories with the walnut are lacking. It is a handsome tree of 60 or 70 feet high—in some cases reaching 90 feet.—*C. tomentosa* yields the Mocker Nut, and *C. amara* the Bitter Nut; while the Pig-nut Hickory, also with a bitter nut, is *C. porcina*.

Hicks, ELIAS, a celebrated American preacher of the Society of Friends, was born at Hempstead, Long Island, March 19, 1748. At the age of twenty-seven he was already a well-known preacher, and for many years he travelled through the States and Canada, receiving no compensation for his labours, and when not preaching labouring on his own farm. He was one of the first in his body to agitate against slavery. An able preacher, he exercised great influence among his co-religionists until his unitarianism, or denial of the divinity of Christ and a vicarious atonement, brought him into disfavour with orthodox Friends; but he published his own views with perseverance, and at the age of eighty still travelled and preached. The result of his labours was a schism of the society into two divisions, popularly known as Orthodox and Hicksite Friends (see FRIENDS). He died at Jericho, Long Island, February 27, 1830. See his *Journal* (Phila. 1828) and *Letters* (1834).

Hidalgo, a word explained as being originally *hijo de algo*, 'son of something,' is the title of a member of the lowest class of Spanish nobility.

Hide, in old English law, denoted a certain area of land, the exact quantity of which is variously

given as 60, 80, 100, and 120 acres. According to Maitland it was 'a lame compromise between a unit of area and a unit of value.'

Hides. See LEATHER.

Hidēyoshi (1536-98), Japanese military leader and statesman, born to great poverty at Owari, became a groom and then a soldier. His rise was rapid. He commanded the army which brought the island of Shikoku into subjection; to avenge a private insult he invaded Kyushu, defeating the Satsuma forces; and by 1590 the whole land was united under his rule. He founded the city of Osaka. As a step to the conquest of China he invaded Korea (1592); and in the six years to his death war was waged with a brutality perhaps never equalled, inflicting wounds from which Korea never recovered.

Hieracium. See HAWKWEED.

Hierakōnopolis, or NEKHEN, now Kôm el Ahmar, on the Nile below Edfu, was one of the chief cities of Upper Egypt before the unification of the kingdom.

Hierapolis, two ancient cities of the Orient.

(1) Hierapolis, or on coins Hieropolis, was a city of Syria Cyrrhēstia, and stood on the high-road from Antioch to Mesopotamia, 14 miles W. of the Euphrates. Under the Seleucid kings this city was an important centre of trade, particularly in cotton and silk. The great temple of Atargatis (locally known as *Bambyke* or *Mambog*) was plundered by Crassus in 53 B.C. With the growth and spread of Christianity, Hierapolis, refortified by Haroun al-Raschid, was captured by Romanus Diogenes in 1068, and was again stormed by Saladin in 1175. Its decay dates from the Mongol invasion. —(2) Hierapolis was a city of Phrygia, situated between the rivers Lycus and Meander, 5 miles N. of Laodicea. It was celebrated for its hot springs, and for a cave, called Plutonium, whence issued mephitic vapours that proved fatal to life. At Hierapolis, the birthplace of Epictetus, Cybele was much worshipped; and there St Paul founded a Christian church. See Ramsay, *Cities and Bishops of Phrygia* (1895).

Hierarchy (Gr. *hieros*, 'sacred,' and *archō*, 'I govern'), the name used to designate the whole sacred governing and ministering body in the church, distributed according to its several gradations. See ORDERS (HOLY), BISHOP, PRIEST, DEACON; also POPE.

Hieratic Writing. See HIEROGLYPHICS.

Hiero I., king of Syracuse, succeeded his brother Gelon in 478 B.C. The most important event of his reign was the naval victory gained by his fleet and that of the Cumani over the Etruscans in 474, which deprived the latter of their supremacy in the Tyrrhenian Sea. Though violent and rapacious, he was a lover of poetry, and the patron of Simonides, Æschylus, Bacchylides, and Pindar. Hiero died at Catana in 467 B.C.

Hiero II., king of Syracuse (270-215 B.C.), was the son of a noble Syracusan named Hierocles. During the troubles which prevailed in Sicily after the retreat of Pyrrhus (275 B.C.) Hiero greatly distinguished himself, and was first appointed commander-in-chief and then elected king of the Syracusans. He joined the Carthaginians in besieging Messina, which had surrendered to the Romans; but he was beaten by Appius Claudius, the Roman consul, and compelled to return to Syracuse. In 263, however, he concluded a peace with the Romans for fifteen years, during which he proved so faithful to his engagements that in 248 peace was permanently established. In the second Punic war Hiero likewise proved himself the faithful ally of the Romans, and supported them with

money and troops, especially after their defeat at the lake of Thrasyraene. He died in 215, and was succeeded by his grandson Hieronymus. Hiero, by his clemency, wisdom, and simplicity, quite gained the affections of the Syracusans, and his financial arrangements were adopted by the Romans when they subsequently conquered Syracuse. He devoted great attention to the improvement of agriculture, and his laws respecting the tithe of corn, &c. (*Leges Hieronicæ*) were still in force in the country in Cicero's time. He was likewise a patron of the arts, particularly architecture; and Archimedes was his relative and friend.

Hierocles, the Neoplatonist, lived at Alexandria about the middle of the 5th century, and enjoyed a great reputation. He is usually reckoned the author of a commentary on the golden verses of Pythagoras (edited by Mullach, 1853). A collection of jests (*Asteia*) used also erroneously to be fathered on him.

Hieroglyphics (literally 'sacred sculptures; from *hieros* and *glyphō*), a term applied to the representations of objects used to express language, especially those which the ancient Egyptians, Mexicans, and other nations employed for that purpose. The term *hieroglyphs* would, however, be more correctly applied to these figures. The number of those used by the ancient Egyptians was probably about 1700, and by means of them they were enabled to express all their ideas with correctness, clearness, and facility. They consist of representations of figures of men and women and their limbs; quadrupeds, birds, fishes, and reptiles; plants, trees, and flowers; celestial bodies; mountains, islands, stones, water; towns, buildings, rooms and parts of a house; fighting implements and sceptres; articles of furniture; musical instruments; mathematical figures; crowns and baskets; ships and their various parts, &c. Hieroglyphics were inscribed upon granite, basalt, porphyry, and sandstone; they were cut or painted upon wood and plaster; and they were written upon papyrus, slabs of calcareous stone, and leather. A reed pen,

gash, was used for writing upon papyrus.

The palette used for holding the ink was usually a flat, rectangular piece of wood or ivory measuring about 2½ inches by 12. At one end of this two or more holes were hollowed out for holding ink. The colours most commonly used were black, red, and green; the first was made from vegetable, the second and third from mineral substances.

Inscriptions on Egyptian monuments are sometimes inlaid with colours, an attempt being made to imitate the natural colours of the animals and objects, representations of which are employed to form the inscription. The painted inscriptions which are found upon the inner coffins in the tombs of the 18th and 19th dynasty usually follow a conventional design; the number of colours used upon them being comparatively few, six at the most. But on the Ani papyrus in the British Museum as many as thirteen colours are used. On papyrus they are usually drawn in outline in black. The rubrics and initial words are usually written in red. Hieroglyphics are written in horizontal lines or perpendicular columns, which are separated by lines drawn in black ink. Usually they are to be read in the direction in which they face, and are so arranged as to cover completely all the parts of the papyrus which were to be written on. Egyptian hieroglyphics are read in the order in which they are written; this order is sometimes broken for the sake of symmetrical arrangement.

Hieroglyphics are either phonetic or ideographic; the former class comprises signs which represent sounds, and the latter those which represent ideas.

Phonetic signs are either alphabetic or syllabic. The hieroglyphic alphabet is as follows :

	a		h
	â		h
	â		χ
	i		s
	u		sh
	b		q
	p		k
	f		k
	m		t
	n		t
	l or r		th
	r or l		t

The earliest Egyptian hieroglyphic inscriptions known to us are filled with the alphabetic signs here given; this fact shows that so far back as 3800 B.C. the use of phonetic signs was well known and used. The other phonetic signs have syllabic values. A large number of the hieroglyphics are employed as *ideographs*, or representations of ideas. Every word in Egyptian has one *determinative* or more at the end of it. Thus, after the word for tree

we have the picture of a tree, ; and after the word

for dog we have the picture of a dog, . An abstract idea, such as joy or gladness, was expressed by the figure of a woman beating a tambourine, or a man dancing, or by the figure of some object possessing it, as a jackal, to express the idea of cunning or craft; a seated man, signifying man, was applied to all relationships, functions, and offices of men, as *âtf*, 'father'; *sen*, 'brother'; *mer*, 'governor'; *hen*, 'priest'; *bak*, 'labourer'; the special meaning which it conveyed being shown by the phonetic groups which preceded it. In the same way all beasts, or objects made of leather, were expressed by a skin, ; all precious stones or objects made of the same, by ; all actions of moving, standing, or stretching, by two legs, ; and all actions in which the idea of strength was to be conveyed, by an arm and a stick, . The number of these signs may be computed at about 150, and they resemble in their use those of the Assyrian cuneiform, in which, although to a more limited extent, the leading classes of thought were determined by a character prefixed or affixed to the phonetic group giving the particular idea. Thus, in the Assyrian, all names of men are preceded by a single upright wedge, ; all countries by ; names of horned cattle by ; and after the names of certain places, Babylon, for example, is affixed. In the Egyptian system, however, the determinatives are always placed after the phonetic groups, and are more numerous. The Chinese system of writing approaches still more closely to the Egyptian, 242 radicals, as they are called, but really determinatives, being placed after other groups and symbols, which indicate the special idea intended. In this last language the radicals are generally

placed to the left, except in those instances in which they enclose the phonetic or special groups. In the Egyptian hieroglyphs every word not expressing an abstract idea, such as the verb 'to be,' or the grammatical forms and pronouns, is accompanied by its determinative, and is incomplete without it. The following examples will illustrate the use of determinatives in Egyptian :

	sesh,	a bird's nest.
	uâa,	a boat.
	hebs,	clothes.
	âneb,	wall.
	ket,	little.
	tebhû,	to pray.
	sexsex,	to run away.
	nehes,	to awake.

SPECIMENS OF ALPHABETIC AND SYLLABIC HIEROGLYPHIC CHARACTERS.*

	an eagle, A.		leg of a stool, Âhâ.
	an arm, Â.		a house, H.
	a reed, Â.		a sieve, χ.
	a calf, Uâ.		a garment, Ūa.
	a heron, Ba.		a lion, R or L.
	a leg, B.		a mouth, L or R.
	a cerastes, F.		a pen, M.
	a wild fowl, Tâ.		a weight, Mâ.

	a papyrus plant, Hâ.		a bolt, S.
	fore-part of lion, Hâ.		back of chair, S.
	twisted cord, H.		a garden, Sha.
	a tusk, Hn.		a pool, SH.
	a finger, Teb.		a spindle, θ.

* The first fount of hieroglyphic type was cut in England from drawings by the late Mr Bonomi. For the hieroglyphics used in this article we are indebted to Messrs Harrison, printers, London.

 two reeds, I.	 a hand, T.
 { two oblique strokes, I.	 tongs, θ.
 a bowl, K.	 a cake, T.
 part of dress, χα.	 a chicken, U.
 { leaf of water-lily, χα.	 a twisted cord, U.

Under the rule of the Ptolemies in Egypt the values of the hieroglyphs were systematically changed. Thus , *χεν*, became *m*; , *nes*, became *n*, and so on. The various forms of the same vowel were confused with one another, and many changes between consonants took place.

The language of the hieroglyphs is most nearly represented by Coptic. Coptic is a name given to the Egyptian language written with the letters of the Greek alphabet, and a few signs borrowed from the demotic forms of some of the hieroglyphs. The Bible was translated into Coptic early in the 3d century A.D., and the greater part of this work, indispensable for the proper study of the hieroglyphs, has come down to our time. Coptic literature is chiefly theological, and the texts are full of Greek words. The forms of Egyptian words as given in the hieroglyphs are often considerably modified in Coptic; many of the changes are caused by phonetic decay. The Coptic language ceased to be spoken about a century ago. See COPTS.

In Egyptian the noun has two genders, masculine and feminine; feminine nouns usually end in *t*. Plural nouns end in *u* or *iu*, and are generally followed by  or . In Egyptian nouns have no declensions, and the cases are expressed by particles placed before nouns. Adjectives have no grammatical forms to indicate degrees of comparison. The following are the principal Egyptian numerals:

 uā	1	 paut	9
 sen	2	 meti	10
 xemt	3	 'taut	20
 ftu	4	 māb	30
 tūa	5	 shaā	100
 suu	6	 xā	1000
 sexef	7	 teb	10,000
 xemennu	8	 hefnu	100,000
		 heh	1,000,000
		 shen	10,000,000

The personal pronouns are: *nuk* or *ānuk*, 'I,' *entuk* (masc.), *entut* (fem.), 'thou'; *entuf*, 'he,' *entus*, 'she'; *entuten*, 'you' (plur.); *entusen*, *entu*, 'they.' The personal suffixes are *ā*, 'I,' *k*, 'thou' (masc.), *t*, 'thou' (fem.); *f*, 'he,' *s*, 'she,' *n*, 'we'; *ten*, 'you'; *sen*, *set*, 'they.' The Egyptian verb has no tenses, moods, voices, conjugations, or personal endings. The exact meaning of a verb must be gathered from the context or the syntax of the sentence. The Egyptian verb is often accompanied by one of the following auxiliary verbs: *āu*, 'be,' *un*, 'be,' 'to arise'; *āri*, 'do,' *āhā*, 'stand'; *tā*, 'give.'

Considered as one of the most ancient written languages, Egyptian throws great light upon com-

parative philology, the relative antiquity of various words and locutions, the general construction of language itself, and the development of picture-writing into the abstract ciphers of sound, called letters. During the 19th dynasty, or about 1400 B.C., many Semitic words were introduced into the language by the success of the Egyptian arms in the East, and such words as *bata* for *Beth*, 'a house,' *makaturu* for *Migdol*, 'a tower,' and others, appear; they are, however, rare and few in number compared to the body of the language.

The invention of hieroglyphs, called *Neter kharu*, or 'divine words,' was attributed to the god Thoth, the scribe of the gods, and lord of the hieroglyphs. Pliny attributes their invention to Menon. The literature of the Egyptians was in fact styled Hermaic or Hermetic, on account of its supposed divine origin, and the knowledge of hieroglyphs was, to a certain extent, a mystery to the ignorant, although universally employed by the sacerdotal and instructed classes. To foreign nations the hieroglyphs always remained a mystery, although Moses is supposed to have been versed in the knowledge of them (Philo, *Vita Moyses*). The Greeks, who had settled on the coast as early as the 6th century B.C., appear not to have possessed more than a colloquial knowledge of the language; and although Solon, 538 B.C., is said to have studied Egyptian doctrines at Sebennytus and Heliopolis, and the doctrines of Pythagoras are thought to have been derived from Egypt, these sages could only have acquired their knowledge from interpretations of hieroglyphic writings. Hecataeus (521 B.C.) and Herodotus (456 B.C.), who visited Egypt in their travels, obtained from similar sources the information they have afforded of the language or monuments of the country. Democritus of Abdera, indeed, about the same period (459 B.C.), described both the Ethiopian hieroglyphs and the Babylonian cuneiform, but his work has disappeared. After the conquest of Egypt by Alexander, the Greek rulers began to pay attention to the language and history of their subjects; and Eratosthenes, the keeper of the museum at Alexandria, and Manetho, the high-priest of Sebennytus, drew up accounts of the national chronology and history from hieroglyphic sources. Under the Roman empire, in the reign of Augustus, one Chæremon, the keeper of the library at the Serapeum, compiled a dictionary of the hieroglyphs; and both Diodorus and Strabo mention them, and describe their nature. Tacitus, later under the empire, gives the account of the monuments of Thebes translated by the Egyptian priests to Germanicus; but after his time the knowledge of them beyond Egypt itself was exceedingly limited, and does not reappear till the third and subsequent centuries A.D., when they are mentioned by Ammianus Marcellinus, who notes the translation of one of the obelisks at Rome by one Hermapion, and by Julius Valerius, the translator into Latin of the apocryphal life of Alexander, who gives that of another. Heliodorus, a novelist who flourished 400 A.D., describes (iv. 8) a hieroglyphic letter written by Queen Candace. The first positive information on the subject is by Clement of Alexandria (211 A.D.), who mentions the symbolical and phonetic, or, as he calls it, cyriologic nature of hieroglyphics. Porphyry (304 A.D.) divides them also into cœnologic or phonetic and enigmatic or symbolic. Horapollo or Horus-Apollon, who is supposed to have flourished about 500 A.D., wrote two books explanatory of the hieroglyphs, a rude, ill-assorted confusion of truth and fiction, in which are given the interpretation of many hieroglyphs and their esoteric meaning. After this writer all knowledge of them disappeared till the revival of letters. At the beginning of the 17th century these symbols first attracted atten-

tion, and about 1650 Athanasius Kircher, a learned Jesuit, pretended to interpret them by vague esoteric notions derived from his own fancy, on the supposition that the hieroglyphs were ideographic—a theory which barred all progress, and which was held in its full extent by the learned, till Zoega in 1787 first enunciated the proposition that the ovals or cartouches contained royal names, and that the hieroglyphs, or some of them, were used to express sounds. More monuments were known, and more correct ideas had begun to dawn on the European mind; and the discovery by the French, in 1799, of the Rosetta Stone, a slab of black basalt, having inscribed upon it, first in hieroglyphics, secondly in demotic or enchorial (a cursive popular form of writing extant at the period), and thirdly in Greek, a decree of the priests of Egypt assembled in synod at Memphis, in honour of Ptolemy V., gave the first clue to the decipherment. The first attempts were made upon the demotic text by Silvestre de Sacy with some success, but it was soon discovered that the demotic was not purely alphabetic. Crude notions of the ideographic nature of the hieroglyphs prevailed till Dr Young, in 1818, first gave out the hypothesis that the hieroglyphs were used as sounds in royal proper names. He was led to this conclusion by tracing the hieroglyphs through the cursive hieratic to the more cursive demotic; and, as this last was known to be alphabetic, he inferred that the corresponding hieroglyphic signs were also alphabetic. In this manner he came to the conclusion that the first hieroglyph

in the name of Ptolemy  in the

Rosetta Stone (a door) represented a P, the second (hemisphere) a T; the third (a loop) he supposed to be superfluous; the fourth (a lion) he read OLE; the fifth and sixth, the syllable MI; and seventh, the back of a seat, an S. Unaided by bilingual monuments, he essayed to decipher the name of Berenice, and altogether established the value of five hieroglyphs as letters out of two names, but was unable to proceed further. Champollion (q.v.), in 1822, by means of an inscription found on an obelisk at Philæ, which had at the base a Greek inscription, recognised the name of Cleopatra, and by comparison with that of Ptolemy, at once proved the purely alphabetic, not syllabico-alphabetic nature of the signs. Extending the principle, he read by its means the names of the Greek and Roman, and finally those of the native monarchs. It was soon seen that the same hieroglyphs as those employed in these names were extensively used in the texts for words, and these words turned out in most instances to be analogous to the Coptic. Although the discoveries of Champollion were received by many of the learned in Europe with distrust, yet his method of research was slowly adopted by Rosellini and Salvolini in 1832, and subsequently extended methodically by Lepsius in 1837, and by Bunsen, Hincks, De Rongé, Birch, Goodwin, Chabas, Brugsch, and others.

The method of interpretation adopted has been strictly inductive, the value of the characters being deduced from the equation of sounds, or homophones of similar groups. The meaning of the groups or words has been determined by examining all known instances in which they occur in passages capable of being interpreted, that of the ideographs by observing the form of the symbols; many of them have been made out from the pictures which they explain, or the phonetic groups which accompany them. A careful comparison has been instituted with corresponding Coptic forms when they exist. In short, a careful principle of induction has been applied to the study of the hieroglyphs.

The discovery of another trilingual inscription, that of the tablet at San or Tanis, recording a synodical act of the priests in the reign of Ptolemy Euergetes II., 238 B.C., has confirmed the results obtained by Egyptologists, the meaning of almost all the words having been previously determined; while the power of reading all documents and inscriptions afforded by their researches has resulted in the resuscitation of a knowledge of the history, science, and literature of the ancient Egyptians. The study has long passed into the category of a recognised branch of oriental learning, and the researches have assumed a more critical form. This has been owing to the number of students and the abundance of the material which exists. The doubts with which the interpretations were at first received have succumbed to the conviction that nothing but a logical system of interpretation could have obtained such results. Whatever doubt, in fact, may exist as to the minor details and more delicate shades of language, all the grammatical forms and three-fourths of the words of the old Egyptian language have been established.

The hieroglyphs stood in the same relation to the other two forms of the characters, called hieratic and demotic, as type does to handwriting. Their use was chiefly for official inscriptions on public or private monuments, religious formulae and prayers, and rituals or Hermetic Books (q.v.). The most remarkable hieroglyphic inscriptions are the texts found inscribed upon the pyramids of Pepi, Teta, and Unas; that of Una, recording the conquest of the lands of the negroes at the time of the 6th dynasty; that in honour of Khnumhetp at Benihassan, recording the investiture of his family with the order of the gold collar; the campaigns of Ahmes against the Hykshos at El-Kab; the annals of Thothmes III. at Karnak; the campaign of Rameses II. against the Khita, and the treaty with them; the account of the tanks for gold-washings in the reigns of Seti I. and Rameses II. at Kouban and Redesich; the invasion of Egypt in the reign of Meneptah by the allied forces of the Libyans and other people of the basin of the Mediterranean; the star-risings on the tomb of Rameses V.; the journey of the ark of Khons to Bakhtan, in the reign of Rameses X.; the account of Cambyes and Darius on the statue of the Vatican; the already-cited synodical act of the priests in honour of Ptolemy Euergetes II.; and that of the priests assembled at Memphis, on the Rosetta Stone, in the reign of Ptolemy V.; the sepulchral tablets of the family of Pasheremtah, and the long series of sepulchral tablets of the bull Apis found in the Serapeion, recording the birth, installation, and death of the bulls from the 18th dynasty to the Persians.

In connection with the hieroglyphics are two forms of writing them in common use, first the *hieratic* writing, or a cursive form of hieroglyphic. The number of these written characters is fewer than that of the hieroglyphs, the generic determinatives being more employed, and the vocalic complements of the consonants being constantly written in order to distinguish similar forms. This writing was more extensively used than the hieroglyphic, being employed for state papers, legal documents, memoranda, accounts, religious books, rituals, and all the purposes of private and public life. Books were generally written in hieratic. It commences as early as the 4th or 5th dynasty, and terminates only about the 3d or 4th century of our era. At the earliest period it is occasionally written perpendicularly, but it was afterwards only written horizontally, and has generally portions in red ink, corresponding to our initial illuminated letters or rubrics. Many scholars have held it proved that the hieratic alphabet gave rise to the Phœnician, and have

traced the Phœnician alphabet from hieratic sources (see ALPHABET for a table of the hieroglyphs, the hieratic characters, and the Phœnician alphabet). Others affirm that the precise source of Phœnician writing remains involved in obscurity. The second kind of hieroglyphic handwriting was the *demotic*. It is, like all cursive hands, more difficult to decipher than the hieratic. It was used as far back as the commencement of the 26th dynasty, or the 6th century B.C., and continued in use till the 3d century A.D. This was the last native form of writing in Egypt, the early Christians having introduced the Greek alphabet, with a few characters borrowed from the demotic. This script is rarely used for public monuments, although it appears on the Rosetta Stone; but it was universally employed for contracts, public documents, and occasionally for religious formulæ, owing to the decreasing knowledge of hieroglyphics. At the time of Clement it was the first learned by beginners. With it the Greek language began to appear in public use.

Besides the Egyptian hieroglyphics there are those of the Aztecs or Mexican, which were developed to a stage far above the rude picture-writing of the hunting tribes of American Indians. The system was mainly pictorial, but had made important advances toward attaining phonetic value, especially in the picture-names of persons and places. The simplest kind is where a name meaning 'bird-mountain' is represented by a bird and a mountain; another stage is where a personal name of five syllables is represented by five pictures, each representing a thing whose name corresponds to one syllable of the person's name. After the Spanish conquest, the Franciscans used the Mexican symbols for teaching Christianity. Thus

in the Lord's Prayer in Latin, , a flag, pronounced *Pantti*, was used for the syllable *Pa*; , a stone, *Tetl* for *tē*, the two expressing *Pater*; , a cactus fruit, *Nochtli*, for *Noch*; and a stone, , as above for *te*: these four groups expressing *Pate(r) Nochte, or Noster*; and so forth. Some of the missionaries complained of their difficulties when overwhelmed by converted Mexicans giving their confessions written in this puzzling manner. Some have absurdly affirmed, indeed, that all the Mexican manuscripts are monkish impostures. The most important—religious, administrative, historical—are on parchment or on maguey paper. The Toltec symbols of Central America were different in their method from those of Mexico.—The term hieroglyphic was also used by the writers of emblemata or devices, symbolising Gnomonic sentences taken from the Greek and Latin poets, and having no relation to Egyptian hieroglyphs.—In recent times, too, the astrological almanacs have had their symbolical representations and supposed prognostics of future events, which they called hieroglyphs.

Hieronymites, one of the many hermit orders established in the course of the 13th and 14th centuries. The Hieronymites grew out of the Tertiaries or third order of Franciscans (q.v.). Some of the followers of Thomas of Siena, one of the Franciscan rigorists, having established themselves in various places among the wild districts which skirt the Sierra Morena in Spain, by degrees formed into a community, and obtained in 1374 the approval of Pope Gregory XI., who confirmed their rule, which was founded on that of St Augustine. The institute extended into other provinces of Spain, into Portugal, later into Italy, Tyrol, and Bavaria.

Higden, or HIGDON, RALPH, author of the *Polychronicon*, a general chronicle, in 7 books, detailing events from the beginning of the world to the death of Edward III. Higden's own share in the work is believed to extend down to 1326 or 1327 only, the rest having been written by two continuators. Higden himself was a monk of St Werburgh's monastery in Chester; he is said to have lived there sixty-four years, and to have died in 1364. An English translation of the *Polychronicon* by John of Trevisa was printed by Caxton in 1482. This and another early translation, with the text, have been edited for the Rolls Series (9 vols. 1865–86) by C. Babington (vols. i, ii.) and Professor Lumby (vols. iii.–ix.).

Higgins, MATTHEW JAMES, English essayist, better known by his principal *nom de guerre* of 'Jacob Omnium,' was born at Benown, County Meath, Ireland, on 4th December 1810; was educated at Eton and New College, Oxford; and died at Kingston House, near Abingdon, on 14th August 1868. His intellectual force, his humour and irony were enlisted in the warfare against the abuses and backslidings and minor evils of social and public life, such as the heaping up of legal costs as sung by Thackeray. He wrote no great book, but was a steady contributor to a series of journals, such as the *New Monthly Magazine*, *Morning Chronicle*, *Times*, *Cornhill*, *Edinburgh Review*, *Pall Mall Gazette*, &c. He particularly 'excelled in the implication of the most pungent meaning in a demure simplicity of statement.' He was a man of gigantic stature—6 feet 8 inches high. A few of his sketches were collected by their author, and printed for private circulation in 1857. They appeared again, with others, as *Essays on Social Subjects*, with a Memoir by Sir W. Stirling Maxwell (1875).

Higginson, THOMAS WENTWORTH, an American author, was born at Cambridge, Massachusetts, 22d December 1823, graduated at Harvard in 1841 and at the divinity school in 1847, and was ordained in the same year. He retired from the ministry in 1858. Meanwhile he had been active in the anti-slavery agitation, and, with Theodore Parker, Wendell Phillips, and others, had been indicted for the murder of a man killed during an attempt to rescue a fugitive slave, but escaped through a flaw in the indictment. In the struggle to make Kansas a free state he took a conspicuous part. In the civil war he rose to the command of the first regiment that was raised from among the former slaves. He afterwards returned to literature, and in 1880–81 was a member of the Massachusetts

legislature. He died 9th May 1911. His books include, besides works on American history, biography, and literature, a translation of Epictetus, *Out-door Papers* (1863); *Malbone, an Oldport Romance* (1869), and *Oldport Days* (1873); *Army Life in a Black Regiment* (1870); *Atlantic Essays* (1871); *Common-Sense about Women* (1881); *Cheerful Yesterdays* (1898); *Old Cambridge* (1899); *Contemporaries* (1899); and *Part of a Man's Life* (1905)—the last four autobiographical.

Higham Ferrers, a municipal borough of Northamptonshire, 15½ miles ENE. of Northampton, was till 1832 a parliamentary borough; pop. 3000.

High Commission Court, a court or judicial committee established in 1559 by Queen Elizabeth to investigate ecclesiastical cases, the members being nominated by the crown. In the reign of James I. disputes arose between the common-law courts and the High Commission as to the powers of the latter. In 1611 Coke decided that it had no right to fine or imprison, save in cases of heresy and schism. Laud employed it freely to enforce uniformity and prevent immorality; but the number of clergy punished by it was never great. In two years of its greatest activity only three were deprived and seven suspended. Complaints were made against this extraordinary tribunal, the counterpart for ecclesiastical persons to the Star Chamber for lay offenders, that it exceeded its powers, and was in itself illegal; and it was abolished by the Long Parliament in 1641. See a book by R. G. Usher (1913). A court of commission for ecclesiastical cases, established by James II. in 1686, was abolished by the Bill of Rights (1689). The High Commission Court established in Scotland in 1608 was abolished in 1638.

High Court of Justice. See APPEAL, CHANCERY, COMMON LAW, JUDICATURE ACTS.

Highgate, a northern suburb of London, in the county of Middlesex, 4½ miles NNW. of King's Cross Station by rail. Here Bacon and Coleridge died; Whittington's Stone at the foot of Highgate Hill marks the spot where Dick heard Bow Bells, and turned again; Coleridge's remains, buried in the old churchyard, are now covered by the chapel of the Highgate grammar-school; and in the great cemetery (consecrated 1839) have been buried Faraday, Lord Lyndhurst, 'George Eliot,' and many other famous persons.

Highland Park, a north-western suburb of Detroit, with great automobile works; pop. 46,000.

Highlands, a term applied to the higher parts of a country, as, for example, Highlands of the Hudson, in the state of New York; but commonly used of a particular district in Scotland. This district has no political or civil boundary. Separated by only a vague line of demarcation from the division called the Lowlands, the Scottish Highlands may be briefly described as that portion of the north and north-west of Scotland in which the Celtic language and manners have less or more lingered until modern times. The Highland line, as it is usually called, extends diagonally across the country from Nairn on the Moray Firth to Dumbarton on the Clyde; but the mountainous parts of the counties of Moray, Banff, Aberdeen, Kincardine, and Perth are also understood to be included in the designation Highlands. Caithness might be excluded as being a generally level country; but throughout the Highlands there are rich level tracts, none being more so than the eastern division of Ross-shire. The Hebrides (q.v.) or Western Isles are included in the Highlands, but the Isles of Orkney and Shetland, though to the north, are distinctly excluded, by reason of the Norwegian origin of the inhabitants.

The Highlands are full of lofty hills, some green and pastoral with tracts of heath, and others rugged and bare; seven reach a height of 4000 feet and upwards, and nearly fifty are between 3500 and 4000 feet. Besides the grander features, there are impetuous mountain-torrents, picturesque ravines, and valleys or glens, lakes of singular beauty, and fiords, or narrow arms of the sea (like the lakes, called *lochs*). Perhaps the most remarkable feature in the country is the line of valleys from Inverness to Fort-William, in which lies a series of navigable lochs, united by artificial channels to form the Caledonian Canal. Growing up under a system of clanship, the state of society in the Highlands was antiquated and alien, from a national point of view; while the country was almost impenetrable to travellers or to any species of traffic. The first great attempt to reform this state of affairs was the opening up of the country by roads in different directions, under the superintendence of General Wade, about 1725-26. The next great act of melioration was the abolition of Heritable Jurisdictions (q.v.), including the ancient privileges of the heads of clans, about 1748. And lastly, not to speak of the planting of schools and churches, much was done by the establishment of the Highland and Agricultural Society in 1784. Since these events the ancient patriarchal system has given place to improvements as regards communication, agriculture, dwellings, education, and other modern conditions, including a gradual substitution of English for the Gaelic language. Great numbers of the Celtic inhabitants emigrated in the last quarter of the 18th century. An enormous increase of population had arisen with no corresponding increase of food. The mountains were practically waste; the discovery that sheep thrive upon those natural pastures led of necessity to the letting of them to such tenants as could supply stock. The half-starving people were at various times dispossessed, and their place taken by stock-farmers with capital from the Lowlands; the 'Sutherland clearances,' which have been the subject of so much controversy, took place between 1810 and 1820. While a new character was thus given to extensive Highland pasturages, the value of estates has been very remarkably advanced by being let for the pursuit of game to sportsmen, chiefly persons of rank and opulence from England. What, therefore, with improved farming and shootings, Highland estates in the 19th century rose immensely in value. Inverness is usually spoken of as the capital of the Highlands.

The physical geography of the Highlands is discussed under GREAT BRITAIN; see also SCOTLAND. The clan system is treated at CLAN, and the language of the Highlands at GAELIC; see also CELTS. The condition of the CROFTERS and the measures taken for ameliorating it form the subject of a separate article; and DEER-FORESTS are treated under that head. See also AGRICULTURE, for the Highland and Agricultural Society; HEBRIDES and articles on the several Highland counties and islands; Sir A. Geikie's *Scenery of Scotland*; the guide-books by Anderson, Black, Baddeley, Murray.

HIGHLAND COSTUME.—There is little doubt about the antiquity of the 'garb of old Gaul,' although several writers have adopted the theory that the kilt was introduced by an Englishman early in the 18th century. The idea that the kilt is modern seems to have originated with a writer in the *Scots Magazine* in 1798. The original dress of the Highlander was the Celtic *Fèile-breacan* (or belted plaid). This was a piece of tartan cloth, 2 yards broad and 4 long, which was drawn round the waist in nicely adjusted folds, and tightly buckled with a belt. The lower part came down to the knees in much

the same manner as the modern kilt, while the upper part was drawn up and adjusted to the left shoulder, so that the right arm might be perfectly free. This upper part was the plaid, which was used as a covering for the shoulders and body in wet weather; and when the use of both arms was required it was fastened across the breast with a brooch, often curiously enriched. A brooch was also used to fasten the plaid on the left shoulder. To attire himself in the belted plaid required on the part of the Highlander no small amount of dexterity. The usual way was to lay it on the floor, and after carefully arranging the folds, to lie down upon it, and then buckle it on.

The utility of such a dress in the Highlands is obvious, for the plaid rendered the man indifferent to storms, and prepared to pass a night in the open air in the most inclement weather, while the loose undergarment enabled him to wade rivers or ascend mountains with equal ease. It was thus peculiarly adapted to the warrior, the hunter, and the shepherd. If benighted, the Highlander of old would dip his plaid in water, and then wrap it round him, the woollen cloth swollen with moisture being supposed to resist the wind, while the exhalations from the body during sleep surrounded him with a warm vapour. Heron's *History of Scotland* says that 'in Argyle and the Hebrides, before the middle of the fifteenth century, tartan was manufactured of one or two colours for the poor; more varied for the rich.' The author of *Certain Matters concerning Scotland*, who wrote prior to 1597, said of the Highlanders that 'they delight in marbled cloths especially that have long stripes of sundrie colours; they love chiefly purple and blue.' Martin says that every tribe and every island differed from the rest in the fancy of making plaids, as to the stripes in breadth and colours.

The *Feile-breacan* is now abandoned for the *Feile-beag* (*philabeg* or *filibeg*) as more convenient. The difference is simply this, that, whereas formerly the lower and upper parts of the dress were attached, they are now separated. The lower part has the folds fixed by sewing, and is known as the kilt, which is probably akin to the Danish *kilte*, 'to tuck up,' though the Gaelic *cealt* means apparel in general. The shoulder-plaid, however, is now worn more for ornament than use.

The original garb of the Highlanders, then, was the *Feile-breacan*, and both in its materials and arrangement it was peculiarly the invention of the Gael. Other articles of the costume were Celtic, and are now peculiar to Scotland, but were not distinctively Highland. The *truis* or 'trews' were worn by gentlemen when on horseback, and occasionally by others, especially old men. They were breeches and stockings in one piece, always of tartan, and made to fit very close to the limbs. General Stewart (1822) said that his grandfather always wore the trews on horseback, and the kilt at home. Then there was worn a waistcoat and short-coat, each adorned with silver buttons, and, in the case of gentlemen, with lace and embroidery. A large purse of goats' or badgers' skin was suspended from the belt, and answered the purpose of a pocket. This was the *sporrán*, usually ornamented with silver or brass work and tassels. Brogues and tartan stockings, fastened with broad garters in rich colours; a dirk, with a knife and fork, and sometimes a spoon, stuck in the side of the sheath, and a pair of pistols completed the attire. That of the common people differed only in the deficiency of colours and of silver ornaments. The Highland garb was proscribed in 1747, when it was enacted that any person who should wear the plaid, *filibeg*, trews, or shoulder-belts, tartans or parti-coloured stuffs,

should be imprisoned six months for the first offence, and on second conviction be transported for seven years. This harsh law was repealed in 1782 at the instance of the Duke of Montrose.

Gentlemen, says Stewart, wore one or more feathers in the bonnet, and the common people a tuft of heather, pine, holly, or oak. All, however, had the right to a solitary eagle's plume, whereas only the son of a chief could wear two plumes, and a chief of a clan, three. This was the old clan rule.

The plumed bonnet of the Highland regiments is said to be an adaptation from the knights of medieval Europe. On the island of Inishail, Loch Awe, there is on a tombstone (of 16th century) a figure, with long sweeping ostrich plumes such as those worn by German knights in Dürer's drawings. Similar plumes were also worn by the Earl of Moray in Charles II.'s time, and there are also examples in *The Black Book of Taymouth*. Logan says that the Highland soldiers wore short plumes at the side of the bonnet. The head-dress of the first Highland infantry regiment raised was a simple black cap, with a tuft of feathers added in token of gentility and the right to bear arms. From this the feather-bonnet seems to have gradually developed.

The 'modern' fashion of the kilt (*filibeg*) is found in armorial bearings of the Burnetts of Leys (1626) and the Mackenzies of Coul (1693).

See *Sketches of the Character, Manners, and Present State of the Highlanders*, by Major-general David Stewart. For details of the costume, &c. of the Highlanders, see *The Scottish Gael*, by James Logan; Campbell of Islay's *Tales of the West Highlands*; *The Highlanders of Scotland*, by W. F. Skene; *History of the Highlands, Highland Clans, &c.*, edited by Sir J. S. Keltie; *The Black Book of Taymouth*; *Clan Tartans*, by James Grant (1886), &c. In *The Records of Argyll, Waifs and Strays of Celtic Tradition, and Highland Arms, Dress and Accoutrements*, Lord Archibald Campbell collected an immense amount of interesting and valuable information bearing upon the whole subject; as has Mr Frank Adam in *The Clans, Septs, and Regiments of the Highlands* (new ed. 1924).

HIGHLAND REGIMENTS.—The origin of the first of these regiments, the 42d, has been given under the head **BLACK WATCH**. The valuable services of this regiment encouraged the government to augment the force; and accordingly seven other Highland regiments were soon raised—viz. the 71st in 1777; the 72d, or Duke of Albany's Own, in the same year; the 74th in 1787; the 78th, or Ross-shire Buffs, in 1793; the 79th, or Cameron Highlanders, in 1805; the 92d, or Gordon Highlanders, in 1796; and the 93d, or Sutherland Highlanders, in 1800. In connection with the territorial reorganisation of regiments, the old numerical designations have been dropped, and the battalions linked. There are now 6 Highland regiments, comprising 12 battalions of regulars, 8 battalions of militia (special reserve), 16 battalions of territorials, 8 Canadian battalions, and the Shetland companies (territorials). The regiments are the Black Watch (Royal Highlanders), containing the old 42d and 73rd; Highland Light Infantry, 71st and 74th; Seaforth Highlanders, 72d and 78th; Gordon Highlanders, 75th and 92d; Argyll and Sutherland Highlanders, 91st and 93rd; Queen's Own Cameron Highlanders, 79th (2 battalions). Each regiment has one or more Canadian battalions affiliated to it. With the exception of the Highland Light Infantry, whose uniform is trews and shako, the Highland regiments wear kilts and feather bonnets.

Highness, a title of honour given to princes and minor reigning potentates. The titles 'Highness' and sometimes 'Kingly Highness' were both used in England for the sovereign until the reign of Henry VIII., when they were superseded by

'Majesty.' The children of emperors are or were usually addressed as 'Your Imperial Highness,' of kings as 'Your Royal Highness,' whilst members of princely families have had the titles of 'Serene Highness' and 'Highness.'

High-priest, the chief of the Jewish priesthood, the dignity being hereditary in the line of Eleazar, the son of Aaron. The high-priest was only allowed to marry a virgin, and one who was of his own tribe. Contact with anything unclean, even the dead bodies of his own parents, was strictly forbidden to him. His functions consisted principally in the general administration of the sanctuary and of all that belonged to the sacred service. He alone was allowed to enter the Holy of Holies on the Day of Atonement, and to consult by the Urim and Thummim (q.v.). His costume was of surpassing splendour, purple-red, purple-blue, scarlet, golden, and white being the predominating colours of the ephod, girdle, and breastplate, which he wore above robes of pure whiteness. His revenues were in the main the same as those of the other priests; but, according to the Talmud, he was to be richer than these in virtue of his exalted position, and, if his own means were insufficient, he was to be provided with means by his brethren. This points, however, to post-exilic times, when the high-priest had exchanged his character of *primus inter pares* for that of priestly head of the nation, thereby becoming invested, in so far as the political subjection of the Jews to a foreign power would admit of it, with the prerogatives of ancient kingly power. Nevertheless, in the eyes of the law, the high-priest was only the equal of other Israelites. It is doubtful at what time the office of *Sagan*, or vice-high-priest, was created. See **PRIEST**.

High Seas, the open sea, including the whole extent of sea so far as it is not the exclusive property of any particular country. The rule of international law is that every country bordering on the sea has the exclusive sovereignty over what are called its territorial waters, i.e. all sea to the extent of three miles from its shores, and all sea *intra fauces terræ* (i.e. bays) to an extent but vaguely defined. The rest of the ocean is open or common to all countries. The distinction has little effect on the right of navigation, but as regards fishing it is otherwise. Thus, foreign fishermen may not fish in British waters except under licence or treaty. The three-mile limit is not stereotyped. Many nations claim more, and as it is based on effective control by artillery, it needs revision. See **FISHERIES**, **COOPERAGE**.

High Steward, a title given to several important officers. The peer appointed by the crown to preside at the trial of a peer or peeress for treason or felony is called the Lord High Steward; and there is a permanent officer of the royal household who bears the same designation. The universities of Oxford and Cambridge have each a high steward, whose duty it is to assert and protect the privileges of the university courts.

High-treason. See **TREASON**.

Highway, in Law. See **ROADS**.

Highwaymen, robbers who attack passengers on the public road; those who rob on foot being further distinguished as footpads. Famous English highwaymen were Claude Duval (1643-70), Swift Nick Nevison (hanged at York in 1684), Dick Turpin (1705-39) and his comrade Tom King, and Jerry Abershaw (1773-95). Turpin's famous ride to York is a myth, based on a story told of Nevison, whose fame has even gained him a place in Macaulay's *History of England*. The best-known romances of the road are W. H. Ainsworth's *Rookwood* and Lord Lytton's *Paul Clifford*. There are lists of books bearing on Highwaymen in *Notes and*

Queries, 5th series, vol. viii.; and biographical notices of most knights of the road ultimately came to appear in the pages of the *Newgate Calendar*.

High Wycombe. See **WYCOMBE**.

Hiiumaa, the Esthonian of the island of Dagö (q.v.).

Hijar, a small town of Spain in the province of Teruel, on the river Martín; pop. 4000.

Hijaz. See **HEJAZ**.

Hijra. See **HEGIRA**.

Hike'. See **MAGIC**.

Hilarion, founder of the monastic system in Palestine, was born, according to the account of Jerome (which is adjudged by modern criticism to be no longer historical), at Tabatha, about 290, educated at Alexandria, and converted to the monastic system by St Anthony. He then lived as a hermit in the desert between Gaza and Egypt for many years, and finally died in Cyprus in 372. His memory is celebrated on 21st October.

Hilary, St, Bishop of Poitiers, although by no means among the most voluminous of the Latin Fathers, yet, from the nature of the subjects on which he wrote, chiefly connected with the Arian controversy, occupies an important place in the patristic literature of the Western Church. He was born of pagan parents at Limonum (Poitiers) in the early part of the 4th century. His conversion to Christianity was mainly the result of his own study of the prophecies, and did not take place till he was advanced in life. About the year 350 he was elected bishop of his native city, and immediately rose to the first place in the animated contest of parties in the Arian controversy. Having provoked the displeasure of the court party, he was imprisoned, and sent into exile in Phrygia; but he appears again in the Council of Seleucia in 359, and soon afterwards was permitted to resume possession of his see, where he died in 367. The church holds his day on the 13th January. His most important work is that on the Trinity, but his three addresses to the Emperor Constantius, by their vehemence, and by the boldness of their language, have most attracted the notice of critics. Hilary's theological writings are especially valuable for the history of the Arian party, and particularly for the doctrinal variations of that sect, and the successive phases through which it passed between the Council of Nice and the first Council of Constantinople. He is often styled 'Malleus Arianorum,' and the 'Athanasius of the West,' and was formally recognised as 'universæ ecclesiæ doctor' by Pius IX. in 1851. The most celebrated of the hymns attributed to him is the 'Beata nobis gaudia Anni reduxit orbita,' which was early inserted in western liturgies. The English Hilary term begins on the 11th and ends on 31st January.

See two German Lives by Reinkens (1864) and Baltzer (1881); also J. G. Cazenove's *Saint Hilary of Poitiers and Saint Martin of Tours* in the series of 'Fathers for English Readers' (1883). The best edition of the works of St Hilary is that of the Benedictine Dom. Coutant (Paris, 1693; new ed. 1844-45).

Hilary of Arles, Sr, was born about 403, educated at the celebrated monastic school of Lerins, and made bishop of his native city in 429. As metropolitan of Arles (*Arelate*) he presided at several synods, and especially at Orange in 441, the proceedings of which involved him in a serious controversy with the pope, Leo the Great. A deposed bishop, named Chelidonius, having carried an appeal to Rome, a council was summoned by Pope Leo, at which Hilary was present, and in which the condemnation of Chelidonius, as well as that of another bishop, Projectus, was reversed. Hilary, however, refused to submit to the decision, and soon afterwards quitted Rome—a proceeding

which drew upon himself a very severe animadversion. He did not question the authority in itself, but he maintained that it was uncanonically exercised. In the end, however, he sought a reconciliation with Pope Leo, and the dispute was brought to an amicable termination. Hilary died at Arles in 449, and was canonised, his day being the 5th May.

Hilda, or **HILD**, ST, patroness of Whitby, was daughter of Hereric, a nephew of Edwin of Northumbria, and was baptised at fourteen by Paulinus. Recalled by Bishop Aidan from her retreat in a French monastery, she became abbess of Heorta or Hartlepool in 649. In the year 657 she founded the famous monastery of Streoneshalh or Whitby, a double house for nuns and monks, over which she ruled with remarkable wisdom for twenty-two years, dying in 680. Scott's *Marmion* commemorates the belief that the fossil ammonites found here were snakes 'changed into a coil of stone' by Hilda's prayers. Her effigy still stands on the ancient seal of Hartlepool, and churches preserve her name both there and at South Shields.

Hildburghausen. See SAXE-MEININGEN.

Hildebrand. See GREGORY VII.

Hilden, a town of Rheinland, 8 miles SE. from Düsseldorf, has woollen, silk, velvet, and carpet manufactures, calico-printing, and machine-shops; pop. 17,000.

Hildesheim, a town in the Prussian province of Hanover, stands on a feeder of the Weser, 24 miles by rail SSE. of Hanover. It is to a large extent an antique town, with narrow streets, high-gabled houses (ornamented with bay-windows and carved woodwork), and many towers. The churches are the most notable buildings, and first amongst them stands the cathedral, dating from the 11th century. It is especially interesting for its antiquarian and artistic treasures, as the bronze gates (1015) with bas-reliefs, the church utensils, the so-called Irmin (q.v.) pillar, a rose-tree said to be a thousand years old, the brazen Christ pillar (1022), the carillon, &c. The St Godehard Church (1133-72) and St Michael's are splendid examples of Romanesque architecture. The so-called Templar House, the town-house (*circa* 1440), and certain antique private houses are interesting buildings. Pop. (1880) 25,887; (1910) 54,821; (1919) 53,499. A bishop's see since 822, Hildesheim first came to Prussia in 1803, and finally in 1866. In 1868 a very valuable find of Roman silver ware was made near Hildesheim.

Hilgenfeld, **ADOLF** (1823-1907), theologian, was born at Stappenbeck near Salzwedel, studied at Halle and Berlin, and settled at Jena as professor of Theology (1850), representing the liberal school. Among his works are books on the Clementines, the Gospel of Mark, the Epistle to the Galatians, the Apostolic Fathers (1853), the Gospels (1854), *Das Urchristenthum* (1855), the Jewish Apocalyptic Writings (1857), Ezra and Daniel (1863), *Novum Testamentum extra Canonem receptum* (4 parts, 1866; 2d edition, 1876-84), *Messias Judæorum* (1869), *Hermas* (1873), an Introduction to the New Testament (1875), and the *Ketzergeschichte des Urchristenthums* (1884). From 1858 he edited the *Zeitschrift für wissenschaftliche Theologie*.

Hill, **AARON** (1685-1750), the son of a Wiltshire squire, was born in London, wrote poems to Peterborough and Peter the Great, was attacked by Pope in the *Dunciad*, and produced a dozen plays, of which *Zara* (after Voltaire's) was successful. His various schemes for making potash, beech-mast oil, &c., and rafting timber for the navy down the Spey, did not enrich him. See study by D. Brewster (1913).

Hill, **OCTAVIA**, improver of working-men's houses, was the grand-daughter of Dr Southwood

Smith, a well-known sanitary reformer, and was born about 1838. She laboured amongst the London poor under Frederick D. Maurice; and in 1864, supported by Ruskin, she commenced her great work of improving the homes of working-men in the slums, by teaching the people to help themselves, and by inculcating cleanliness, order, and self-respect. Her efforts were crowned with singular success. She wrote *Homes of the London Poor* (1875), *Our Common Land and other Essays* (1878). She died 13th August 1912. See Life by C. E. Maurice (1913).

Hill, **REV. ROWLAND**, a popular but eccentric preacher, was born 12th August 1744, at Hawkeston, the sixth son of a Shropshire baronet. Whilst a student of St John's College, Cambridge, he fell under the influence of Whitefield, the Methodist preacher, and at once began to tread in his footsteps. All his life through Hill retained his passion for open-air preaching; and the first ten years after his ordination were spent in itinerant preaching throughout England. But having built for himself Surrey Chapel in Blackfriars Road, London, in 1783, he regularly preached there to his life's end; and, although a Dissenter, he used the services, and regarded himself as a member of the Church of England, of which he had indeed been ordained a deacon. It is said that the 'first Sunday-school in the metropolis was established by Rowland Hill soon after the opening of Surrey Chapel.' He died on 11th April 1833. Rowland Hill was undoubtedly eloquent, and possessed a rich fund of genuine humour, but at times his manner verged upon buffoonery. His *Village Dialogues* (1801) was sold in large numbers. Besides this he wrote several pamphlets, as *Imposture Detected* (1777), *Aphoristic Observations* (1790), *Spiritual Characteristics* (1803), some volumes of *Sermons, Hymns*, and other works. See Lives by Sidney (1834), W. Jones (1834), Sherman (1857), Broome (1881), and Charlesworth (1876).

Hill, **ROWLAND**, **VISCOUNT HILL**, was son of Sir John Hill of Hawkeston and nephew of the preceding, and was born at Prees Hall, in Shropshire, August 11, 1772. Entering the army at fifteen, he became captain at twenty, commanded the 90th regiment in Sir Ralph Abercromby's Egyptian expedition, and was gazetted brigadier-general in 1803. He accompanied Sir Arthur Wellesley to Spain in 1808, and was his right arm throughout the whole Peninsular war. His conduct and courage earned him a C.B. in 1811, and three years later he was made Baron Hill of Almaraz for his capture of the forts of Almaraz. At Waterloo he led the brigade which swept the Old Guard from the field, and he remained with the army of occupation as second in command until it evacuated the French territory. He succeeded Wellington as commander-in-chief of the army in 1828, but resigned in 1842, when he was made Viscount Hill. He died unmarried at Hardwicke Grange, Shropshire, December 10, 1842, and was succeeded in his titles and estates by his nephew Sir Rowland Hill, Bart. See his Life by the Rev. Edwin Sidney (1845).

Hill, **SIR ROWLAND**, **K.C.B.**, originator of the uniform penny postage system and reformer of the post-office, was born at Kidderminster on 3d December 1795. From a very early age down to 1833 he taught in his father's school—from 1819 in Hazlewood, near Birmingham, a school-house built by himself, and afterwards at Bruce Castle, Tottenham. Rowland was always of an inquiring and ambitious turn of mind, with a decided talent for initiating reforms. At first he busied himself with mechanical and other inventions, later in life with questions of public concern. In 1826 he was one of the founders of the Society for the Diffusion of

Useful Knowledge. After he had ceased to teach, he took an interest in the socialistic schemes that were being discussed and experimented with about that time, especially by Robert Owen. Then his restless mind led him to take an active share in the colonisation of South Australia, under Wakefield's system of colonising. Amongst other things his attention had been drawn at different periods to postal questions; and he became sensible that there existed an urgent need for a diminution in the high rates of postage, which practically excluded all but the wealthy from postal intercourse. His views on the subject, advocating a low and uniform rate of postage, to be prepaid by stamps, between all places in the British Isles irrespective of distance, were published in the form of a pamphlet, *Post-Office Reform*, in 1837. His plan was eagerly taken up by Robert Wallace, M.P. for Greenock, who gave essential help in fighting the case through parliament. Two years later Hill was attached to the Treasury for the purpose of putting his projected reforms into execution; and on 10th January 1840 the uniform penny rate came into force. On 6th May following stamped envelopes and adhesive stamps were issued to the public, but the preference for the latter was soon made manifest. In 1841 the Conservative government, which had consistently opposed the reduction of postage, came into office, and in the following year, through the influence of certain government officials who strongly resented all innovations, Rowland Hill was dismissed from his position. Four years later a sum of £13,000, raised by public subscription, was presented to him as a token of public esteem to a national benefactor. In the same year the Liberals returned to power, and Hill was appointed secretary to the Postmaster-general. This office was exchanged in 1854 for that of secretary to the post-office. In 1864 he was compelled to resign owing to ill-health, and was then awarded a pension of £2000 for life, together with a parliamentary grant of £20,000. The effect of his reforms in the United Kingdom has been to raise the number of inland letters from about 77 millions annually to about 1900 millions, or about twenty-five fold, and it may be stated generally that the main principles of his plan have now been adopted in every civilised country throughout the world. Sir Rowland Hill was made a Knight Commander of the Bath in 1860. He died at Hampstead on 27th August 1879, and was buried in Westminster Abbey. Amongst the other improvements he effected in the post-office system must be mentioned the establishment of the book-post (1848), the reform of the money-order office (1848), and of the packet service. See POST-OFFICE, STAMPS; *Sir Rowland Hill, the Story of a Great Reformer* (1907), by his daughter, and the *Life* (1880), by his nephew George Birkbeck Norman Hill (1835-1903), the editor of Boswell's *Life of Johnson*, sometime a schoolmaster, but long an invalid. His eldest brother, MATTHEW DAVENPORT HILL (1792-1872), recorder of Birmingham from 1839 to 1866, distinguished himself by his labours for education and the reformation of criminals. See *Memoir* by his daughters (1878).

Hilla, or HILLAH, a town of Iraq, on the river Euphrates, 60 miles S. of Bagdad, on the site of Babylon, out of the ruins of which it was built about 1100 A.D. Tanning and the manufacture of silk, cottons, and woollens are carried on. The population fluctuates. A branch of the Bagdad railway runs from Hilla by Hindiya barrage to Keibela.

Hillel, called HABABLI ('the Babylonian') and HAZAKEN ('the Elder'), one of the greatest and most influential doctors of the Jewish law, was born about 60 B.C. in Babylonia, of poor

parents, but in the female line of royal (Davidian) descent. When forty years old—so runs the Talmudic account—he migrated into Palestine for the purpose of studying the law under Shemaia and Abtalion, the great masters of the period. Five or six years after Herod had mounted the throne Hillel was elected president of the sanhedrim. The range of his acquirements is said to have been immense, embracing not only Scripture and tradition, but nearly all branches of human and superhuman knowledge. Yet he was one of the meekest, most modest, kind, and simple-hearted men. Hillel was the first who collected the numberless traditions of the oral law, and arranged them under six heads (see MISHNA). Between him and his contemporary Shammai and their respective followers there arose a spirit of keen rivalry, the latter being advocates of greater strictness and rigour in the interpretation of the law. Hillel died about 10 A.D. His doctrine has often been compared with the early teaching of Jesus. See Delitzsch's *Jesus und Hillel* (3d ed. 1879).

Hiller, FERDINAND, pianist, composer, and writer on music, was born at Frankfurt-on-Main on 24th October 1811. Having been a pupil of Hummel, he began to teach in his native town; but from 1829 to 1836 he laboured in Paris. The next nine years he spent partly in Italy, partly in Germany; it was during this period that he produced his best work, the oratorio *Die Zerstörung von Jerusalem* (1839). Then, after three years' service as municipal music-director in Düsseldorf (1847-50), he proceeded to Cologne, where he filled a similar post until his death, 10th May 1885. Amongst nearly 200 musical works which he published only a small number have retained their footing. But as a writer on musical subjects Hiller claims a higher place. His *Uebungen zum Studium der Harmonie und des Kontrapunktes* (12th ed. 1886) is extensively used; and there is much valuable criticism in *Aus dem Tonleben unserer Zeit* (1868-71), monographs on Beethoven (1871) and Mendelssohn (1874; 2d ed. 1878), *Musikalisches und Persönliches* (1876), *Briefe an eine Ungeannte* (1877), *Künstlerleben* (1880), and *Erinnerungsblätter* (1884).

Hillern, WILHELMINE. See BIRCH-PFEIFFER.

Hill-forts, the refuges and strongholds of the early inhabitants, exist in every country of Europe. Their range in time extends from the early prehistoric through the early historic periods of the racial areas in which they are found. They have no more definite form than that of a prevailing but irregular circularity. The site selected is usually enclosed and fortified with due regard to its specialities of situation and defensibility. Sometimes the fort instead of occupying the whole hill-top may occupy only the most defensible part of it. In other cases the whole eminence may be surrounded by defensive constructions completely encircling and protecting its upper portion. Occasionally these forts, though situated among the hills, are planted in the lower ground, commanding an extent of meadow-land or pasture. With regard to their construction, the hill-forts are usually either earthworks or stoneworks, rarely a mixture of both. In France the Gaulish forts of the pre-Roman period were often such extensive works as to be termed *oppida* by the invading Romans. Though built of dry-stone masonry, the parts of the walls most exposed to attack were bound together by great logs of wood, placed both longitudinally and transversely within the thickness of the rampart, so as to resist as much as possible the assaults of the battering-ram. The great dry-built stone rampart of the prehistoric fort at Burghhead, in Elginshire, is similarly strengthened by logs of oak, but it is the only example of this method of construc-

tion yet known in Scotland, where hill-forts are perhaps more numerous than in any other European country. They are generally called 'duns' (see DUN) in the northern and 'camps' in the southern districts, where the older term survives in connection with a number of the principal forts, as Dumbarton (*Dun Bhreathan*), Dundonald in Ayrshire, and Dimpelder in Lothian, not to mention Dun Edin as an old name of Edinburgh. Among the most remarkable of the hill-forts of Scotland may be mentioned those of the two Caterthuns in Forfarshire—one a good example of the fort with earthen rampart, and the other with walls of dry stone—the Tap o' Noth, and the twin-summits of Benachie, each with its massive fortifications of stone, in Aberdeenshire, the remarkable stone fort of Dun Tuathal on Drummond Hill, overlooking the junction of the waters of the Lyon and the Tay, and one equally remarkable, called Dun-dalamb, in a similar situation in Laggan on the Spey, Inverness-shire. Dunadd in Argyllshire, which has the reputation of being the place of inauguration of the Dalriadic kings, was excavated by the Society of Antiquaries of Scotland in 1904. It was found to be a dry-stone fort, occupying, like Dumbarton, one of the summits of a steep rock rising abruptly from the level moor, the wall 12 feet thick and well built, enclosing a space 100 feet long and 45 feet wide at one end, narrowing to the other end to suit the site, and having three annexes of much greater extent lower down the ridge. Upwards of fifty querns were found. The relics were all of the Iron Age, including spearheads and a sword-blade. The occupation seemed to have been long and continuous.

Many of the dry-stone forts in Scotland present the peculiar feature of a partial vitrification of the materials of their walls. The same thing has been observed in similar forts in Ireland, France, and elsewhere. The attempt to account for the existence of this peculiarity has given rise to much speculation and controversy. But it seems to be clearly established that the so-called vitrified forts do not differ from the other dry-stone forts, if the vitrification be not regarded as a process of construction. But no relevant and conclusive evidence on this point has been obtained from examination of the structures themselves. Among the best known of the so-called vitrified forts in Scotland are the Tap o' Noth in Aberdeenshire, Craig Phadric and Dunbhairdgal in Inverness-shire, Knockfarril in Ross-shire, Dun Mac Uisneachan in Argyllshire, and Finhaven in Forfarshire. In Wales stone forts are most numerous, while in England earthworks predominate. The earthen forts of Sussex explored by Colonel Lane Fox are sometimes of considerable magnitude, that of Cissbury, for instance, enclosing a space of 60 acres. They are, as a rule, of prehistoric origin. Some of the stone forts of Ireland, especially those of the Aran Isles, are of great magnitude and well preserved. Photographic views of them are given in Lord Dunraven's book on Early Irish Architecture.

Consult also Dr Christison's 'Prehistoric Forts of Scotland' in the *Proceedings of the Society of Antiquaries of Scotland* (vol. xxxix.); 'Mémoires sur les Ouvrages de Fortifications Gauloises,' &c. in the *Compte Rendu du Congrès Archéologique de France*, at Toulouse in 1874 (p. 427); 'Les Camps Barbares fortifiés en Hongrie,' by F. F. Romer, in the *Compte Rendu of the Congress of Prehistoric Archaeology held at Budapest in 1876* (vol. ii. p. 78); and 'Helvetische Denkmäler,' by Dr F. Keller, in *Mittheilungen der Antiquarischen Gesellschaft in Zürich* (vol. xvi.).

Hill Mustard. See BUNIAS.

Hilversum, a village in North Holland, 18 miles by rail S.E. from Amsterdam, manufactures woollens and carpets; pop. 41,000.

Himalaya (properly *Himālaya*; from two Sanskrit words meaning 'snow-abode') is, strictly speaking, the southern escarpment of the great Central-Asian plateau in so far as it falls between the Indus and the Brahmaputra. Thus limited, it extends from 73° to 95° E. long., over a distance of some 1500 miles. The Himalayas are not a single range, but a system of for the most part parallel ranges lying obliquely to the general direction of the system. They front the plain of the Ganges in northern India like a stupendous mountain wall, bending back in the west like a scimitar, the sharp edge turned next India. On the east the system is connected with the mountain-ranges of south-west China, and northern Burma and Siam. On the north it is backed by the lofty plateau of Tibet, which ranges in elevation from 10,000 to 17,000 feet. At its north-western extremity it runs up into the Pamir plateau, from which radiate also the Hindu-Kush and the Kuen-Lun Mountains. The southern foot of the system rests upon the plain of the Ganges, which nowhere rises more than 1000 feet above the level of the sea. The edge of the outermost hills is skirted, for a distance varying in width from 10 to 15 miles, by a belt of swampy grass-land, traversed by numerous sluggish streams. These in many places overflow and form standing swamps, fringed with gigantic reeds. This belt, called the Tarai, does not extend west of the point where the Ganges breaks through from the mountains. These districts, owing to the great quantity of stagnant water and the great profusion of rank vegetation, are extremely unhealthy; many parts reek with fivers of a very malignant type. Next above the Tarai lies a belt of forest of about the same width, called the Bhabar. Its soil consists of sand, liberally strewn with shingle beds and boulders. The waters of the minor streams that come down from the higher mountains are generally absorbed by this spongy talus-slope, and, passing through it underneath the surface, accumulate again on the upper edge of the lower-lying Tarai.

Above the Bhabar rise the foot-hills of the Himalayan system, generally designated the Siwalik Hills, or sub-Himalayan ranges. They vary in height from a few hundred feet up to 4000, and present steep faces to the plains; on the northern side the slope is gentler, being mostly met at short distances from the summit by the southern flanks of the inner ranges. Geologically the Siwalik Hills belong to the Tertiary formation, and to the Pliocene rather than to the Miocene period. From the ranges near the Jumna great quantities of fossils, mostly mammals and reptiles, all land and fresh-water animals, have been obtained. It is on the north side of the Siwalik foot-hills that the first mountains appear. They rise up abruptly to elevations ranging for the most part from 7000 to 10,000 feet, and cover a surface zone of 50 miles in breadth. This division embraces a large number of irregular ridges, characterised by great complexity of geological structure. They yield marine fossils. On these ranges stand the sanatoriums, such as Simla, Darjiling, Almora, &c., which are so essential to Europeans during the hot months. The space between the outer members of these ranges and the Siwalik foot-hills is occupied by narrow, shallow, longitudinal valleys, called Dun in the west and Mari in Nepal. They are partly covered with loose shingle and boulders, partly worn into terrace-like steps, partly broken by low, obliquely lying, watershed ridges, which throw off numerous small streams.

In the Himalayas two main axes can be determined with tolerable distinctness. One, the southern, contains the line of the great snowy

peaks; the other, the northern, forms the watershed between the rivers of India and the rivers of Tibet. The mountains in the southern chain are amongst the loftiest in the world; a very great number of them exceed 20,000 feet ($3\frac{1}{2}$ miles) in height. One of these, Mount Everest (29,002 feet), is the highest measured mountain in the world. Other lofty peaks in this division of the Himalayan system are Namcha Barwa (25,445); Kinchinjinga (23,156); Dhawalagiri (26,286); Nanda-Devi (25,700); Trisul (23,400), and several others more than 22,000 feet in altitude. The chain of great snowy peaks is, strictly speaking, a series of mountain-groups, each of which is connected with the watershed chain to the north by a transverse ridge, covered with snow and frequently bearing on its shoulders peaks that tower up to the height of 25,000 feet. For the northern chain the name of Trans-Himalaya has been proposed by Sven Hedin. It, too, is composed of a close-set series of parallel ranges, independent in a manner, yet even more continuous than those of the southern chain. For while the highest summits are lower, Nien-chen-tang-la, the highest known, being 23,950 feet, the average height of the principal passes from north to south is computed to be 1600 feet greater in the Trans-Himalaya than in the Himalaya proper. Its valleys are shallower and broader and its crests flatter. The Trans-Himalaya is 1400 miles or more long; if it should turn out to be continuous with the mountains of the Salwin and with the Hindu-Kush, its length would be 2500 miles. If the Karakorams be included, however, the northern range possesses the second highest summit of the whole in Mount Godwin-Austen (28,278 feet). As a watershed the northern range is the more important. It divides the rivers of the Indian Ocean from those that flow into the fringe of salt-lakes on its northern side. The Indus alone cuts across it. In the long trough between the two ranges flow the Brahmaputra and the Sutlej, both rising in glaciers of the southern wall. The rivers of the Himalayas mostly make their way through the mountains at the bottom of wild and narrow gorges, often several thousands of feet deep, the path through the various chains being mostly at right angles to the strike of the ridge. The inclination of the rivers is, however, nowhere very steep, except along one line: about ten miles south of the chain of great peaks the rivers descend about 5000 feet in the course of a few miles.

This indicates that the whole region must at one time have been bodily upheaved, and before the period of upheaval there existed here a natural ridge or fold of the earth. Geology indeed teaches that the entire site of the Himalayan system, taken in its widest extent, in which it embraces the whole of the Tibetan plateau as far as the outer Kuen-Lun Mountains, was in distant ages the bed of a vast sea or ocean. The mountains are believed to be the result of mechanical forces operating upon the crust of the earth where it was softest and most pliable. The rocks of this part of the system are principally crystalline gneiss and mica schist, with veins and zones of granite intruding. The snowy region of the Himalayas is plentifully studded with glaciers, some of them of great extent: one has been surveyed in the western part of the system 36 miles in length. In the same region they descend to 11,000 and 12,000 feet, in the eastern part of the system not lower than 13,000 and 14,000 feet; and on the Tibetan side they are seldom found to come lower than 15,000 and 16,000 feet. This difference is partly due to the difference between the angles of declivity on the north and on the south sides of the chief ranges, partly also to differences in climatic conditions, the principal being the heavier snowfall

and the greater rainfall which take place on the south, and the greater dryness of the atmosphere on the Tibetan plateau. Conformably with these facts, the snow-line ranges higher on the Tibetan side than on the Indian; whereas, on the watershed chain, it seldom descends lower than 18,000 feet, and on the tableland remains at 20,000; on the southern faces of the mountains it runs at 15,000 or 16,000 feet. The watershed chain has been little explored; it lies chiefly within Tibetan territory. The only exception to the former statement occurs on the west, where the Mustagh range, which is crossed by the pass of Karakoram (18,350), towers above the mountain valley of Kashmir, forming its northern wall, as the Pir-panjal, a range of the outer Himalaya division rising to 14,000 or 15,000 feet, shuts it in on the south. Much has been added to our knowledge, however, by Sven Hedin, who has crossed the Trans-Himalaya at many points.

The Himalayas proper possess few lakes. In the east, north of Sikkim, are Yamdok-tso or Palti, and Chomto-dong. More to the west lie the holy Tibetan lakes of Manasarowar and Rakas-tal, which give birth to the river Sutlej. Besides these there are Naini-tal in Kumaon and the Lake of Kashmir. The Trans-Himalayan range is bordered to the north by an extensive series of salt-lakes, such as Nam-tso, Zilling-tso, Kyaiing-tso, Dangrayum-tso, and Ngangtse-tso. These receive the whole northern drainage of the range. Though they stand very high they occupy a depression, and have no outlet. In nearly all parts of the Himalayas metallic ores have been ascertained to exist. But gold, iron, copper, and lead are the only minerals extracted. Gold is largely mined in Tibet; copper and iron ore are worked in Kumaon and Garhwal.

In the lower, hotter, and moister parts of the Himalayas, chiefly towards the east, the flora is closely related to that of the Malay Peninsula and islands. Farther west it approximates to the European flora. On the lower ranges the chief vegetative forms are sals, sissus, bamboos, palms, acacias, rhododendrons, ferns, orchids, &c. in the east, and oaks, pines, spruces, firs, cedars, and others in the west. On the highest ranges the principal trees are conifers and poplars, and there are many alpine plants. The European beech does not grow on the Himalayas. Cultivation does not ascend higher than 7000 feet, except in a few of the warmer valleys. The plants of greatest commercial importance cultivated on the Himalayan slopes are tea and cinchona. In respect of its fauna this region is one of the richest in the world, particularly in birds. Among the more remarkable animals may be mentioned bears, wild cats, leopards, tigers, sun-bears, cat-bears, yaks, musk-deer, wild goats, wild sheep, wild dogs, flying squirrels, the bamboo-rat, and water-shrews. Insects are almost as numerous as birds.

Within Indian territory most of the inhabitants of these mountains are Hindus. The Tibetan portions are occupied by peoples of Turanian stock. No statement can be given of the total number of these mountaineers; many of them live in remote valleys, and are almost unknown, whilst many others dwell outside the limits of the British dominions. In Hindu mythology these majestic mountains are invested with great sanctity. Thousands of pilgrims travel year after year to the holy sources of the Ganges. The temples they visit stand beside the glaciers from which the river emerges, at Gangotri, Kedarnath, and Badrinath. Other temples, scarcely less sacred, stand beside the source of the Jumna at Jannotri.

Him'era, an ancient city on the north coast of Sicily, east of Panormus (*Palermo*), and near the mouth of the river Himera, was a Greek colony established 649 B.C., and destroyed in 409 by the Carthaginians, who afterwards built Thermæ (mod. *Termini*) across the river. Stesichorus was a native of Himera, Agathocles of Thermæ.

Himilco. See CARTHAGE.

Himyaritic, a name formerly in use for the language of the ancient Sabæan inscriptions in the south-west of Arabia. See ARABIAN LANGUAGE, SABÆANS, SEMITES.

Hinckley, an ancient town (an urban district) of Leicestershire, 13 miles SSW. of Leicester. Its parish church, with a beautiful oak roof, is supposed to have been erected during the reign of Edward III. Hinckley has manufactures of cotton hosiery and of boots and shoes. It stands on the old Watling Street. Pop. (1851) 6111; (1901) 11,304; (1911) 12,837; (1921) 13,644.

Hincmar, a celebrated churchman of the 9th century, of the family of the Counts of Toulouse, was born in 806. He was educated in the monastery of St Denis; was named abbot of the abbeys of Compiègne and St Germain; and in 845 was elected Archbishop of Rheims. Rothadius, Bishop of Soissons, and suffragan of Hincmar, deposed a priest of his diocese, who appealed to Hincmar, as metropolitan, and was ordered by him to be restored to office. Rothadius, resisting this order, and having been in consequence excommunicated by the archbishop, appealed to the pope, Nicholas I., in 862, who at once ordered Hincmar to restore Rothadius, or to appear at Rome to vindicate the sentence. Ultimately Nicholas annulled the sentence. Hincmar, after some demur, was forced to acquiesce, and Rothadius was restored to his see. Hincmar wrote much against the strong predestinarian views of the monk Gottschalk, whom he united with others in degrading and imprisoning. Gottschalk died in prison after eighteen years' confinement.

The conduct of Hincmar is also historically interesting in relation to the temporal power of the medieval papacy. Under Adrian II. a question arose as to the succession to the sovereignty of Lorraine on the death of King Lothaire, the pope favouring the pretensions of the Emperor Lewis in opposition to those of Charles the Bold of France. To the mandate which Adrian addressed to the subjects of Charles and to the nobles of Lorraine, accompanied by a menace of the censures of the church, Hincmar offered a firm and persistent opposition. He was equally firm in resisting the undue extension of the royal prerogative in ecclesiastical affairs. When the Emperor Lewis III. sought to obtrude an unworthy favourite upon the see of Beauvais, Hincmar boldly remonstrated, and fearlessly denounced the unjustifiable usurpation. Hincmar died in the year 882.

His works were collected by the Jesuit Sirmond (1645), and are to be found in Migne's *Cursus Patr. Compl.* His *Annales Bertiniani*, from 861 to 882, are in vol. i. of Pertz's *Monumenta*. See Prichard, *Life and Times of Hincmar* (1849), and German works by Noorden (1862), Sdralek (1881), and Schrörs (1884).

Hind, JOHN RUSSELL, astronomer, was born at Nottingham, May 12, 1823. At an early period he became an enthusiast in the study of astronomy, and in 1840 obtained, through the influence of Professor Wheatstone, a situation in the Royal Observatory at Greenwich, where he remained till June 1844. Hind was then sent as one of the commission appointed to determine the exact longitude of Valentia, and on his return became the observer in Mr Bishop's Observatory, Regent's Park, London. Here he calculated the orbits and declination of more than seventy planets and comets, noted a number of new movable stars, and between 1847 and 1854 discovered ten minor planets (see PLANETOIDES). In 1851 Hind obtained from the Academy of Sciences at Paris their Lalande medal, and was elected a corresponding member; in 1852 he obtained the Astronomical Society of London's gold medal, and a pension of £200 a year from the British government; in 1853 he undertook the editing of the *Nautical Almanac*. Hind's scientific papers were generally published in the *Transactions of the Astronomical Society*, in the *Comptes Rendus* of Paris, and the *Astronomische Nachrichten* of Altona. Amongst his works are *Astronomical Vocabulary* (1852), *The Comets* (1852), *The Solar System* (1852), *Illustrated London Astronomy* (1853), *Elements of Algebra* (1855), and *Descriptive Treatise on Comets* (1857). For a time president of the Royal Astronomical Society, he died 23rd December 1895.

Hindenburg, formerly ZABRZE, a town of Prussian Upper Silesia, 50 miles SE. of Oppeln. It has large coal-mines, and manufactures cables and machine-oil. Its name was changed in honour of the field-marshal. Pop. (1919) 66,911.

Hindenburg und Beneckendorff, PAUL VON, German soldier, was born at Posen in 1847. He joined the army in 1865, and served in the Franco-Prussian war of 1870; but his promotion was slow, and it was only in 1904 that he was appointed to command the 4th Army Corps, then stationed on the Eastern frontier. From then until his retirement in 1911, he studied the geography and strategical possibilities of this district minutely, gaining knowledge which he was to turn to good account in later years. In 1914, when East Prussia was overrun with the Russians under Rennenkampf, Von Hindenburg was called to command the 8th Army, and in the months following he won the great victories of Tannenberg and the Masurian Lakes, which saved Germany from the menace of a Russian invasion. In 1915 he advanced against Riga and Dvinsk, and in November of that year took over command of all the Eastern armies of Germany, as well as part of the Austrian forces, with the rank of field-marshal. Finally, in August 1916 he was made chief of the Great General Staff, with Ludendorff as his executive officer, and as such he controlled all the operations of the German armies, both East and West. He became the personification of the German spirit, and a national figure-head with enormous power and prestige; in fact, so great was his position that after the Armistice the Republican party appealed to him to lead the army home for demobilisation, a task to which his patriotic devotion and genius was given with great success. He retired in 1919, to live as a private citizen at Hanover. In 1920 he published *Aus Meinem Leben*, of which there is an English translation. In 1925 he was elected president of the Reich. For his battles, &c., see WAR (GREAT).

Hindi. See INDIA (*Languages*).

Hindiya Barrage, an engineering undertaking in Mesopotamia, which diverts the excess waters of the Euphrates past Hilla and Diwaniya and the valley of the ancient Pison, while a large area of land is irrigated by

means of a great central canal. It has brought prosperity to an area which was largely depopulated and had fallen into destitution.

Hindley, a town of Lancashire, 3 miles SE. of Wigan. There are numerous coal-works in the vicinity, and cotton is manufactured. Pop 4000.

Hinduism. See INDIA (*Religion*).

Hindu Kush (the 'Indian Caucasus' of Alexander the Great's historians) forms the westward continuation of the Himalayan system, of which it is sometimes reckoned a part, and from which it is separated by the chasm through which the Indus breaks its way to the plains. It strikes off from the south-west angle of the Pamir plateau, and extends westwards for 365 miles to the Bamian valley in Afghanistan, separating that country on the south from Turkestan on the north. Near its point of origin several rivers take their birth; the Oxus goes off north-west through Turkestan, and the Helmund south-west through Afghanistan. The main range breaks into four subsidiary ridges, and has a total width of about 200 miles. Unlike the Himalayas, it sinks suddenly to the plains of Turkestan on the north. It is crossed by several passes, at an average elevation of 12,000 or 13,000 feet. From the Bamian valley the range is continued westwards as a low watershed elevation, known as Koh-i-Baba. (Koh-i-Baba is also the name of a peak in the Hindu Kush.) The peak of Hindu Koh, about 80 miles to the north of the city of Kabul, is estimated to be more than 20,000 feet above the sea. The highest point in the range that has been yet measured exceeds 23,000 feet. The flanks of the mountains are mostly barren and destitute of cultivation; but minerals, especially iron, occur in great abundance. The inhabitants consist principally of Dards (see DARDISTAN) and Shins, the latter the descendants of the original colonists of the country. A loose kind of Mohammedanism is the prevalent form of religion. Conway ascended Pioneer Peak, 23,000 feet. See HIMALAYAS.

Hindus, Hindustan, Hindustani. See INDIA.

Hinnom, VALLEY OF. See GEHENNA.

Hinny, the hybrid produced between a horse and a female ass. It is smaller than a mule, but the body is more bulky in proportion to the legs, and its strength is inferior. It is less valuable than the mule, although it is more docile. The hinny is rare.

Hinojosa-del-Duque, a town of Spain, 45 miles NNW. of Córdoba, with some linen and woollen manufactures; pop. 12,000.

Hinton, JAMES, aurist and ethical writer, was born at Reading in 1822, son of a Baptist minister, studied medicine at St Bartholomew's Hospital, and, after much travel, settled about 1850 in London, ultimately becoming a specialist in aural surgery. From 1862 till 1874 he was a lecturer at Guy's Hospital. He died 16th December 1875. He published *Man and his Dwelling-place* (1859), *Life in Nature* (1862), and the *Mystery of Pain* (1865); and after his death appeared, with other works, *Philosophy and Religion* (1881) and *The Law-Breaker and Coming of the Law* (1884). See his *Life and Letters*, by Ellice Hopkins (1878); and for another side of his speculations, *Three Modern Seers*, by Mrs Havelock Ellis (1910).

Hlogo. See KOBE.

Hip-joint is a ball-and-socket joint formed by the reception of the globular head of the thigh-bone (or femur) into the deep pit or cup in the os innominatum, which is known as the acetabulum. If the variety of the movements of this joint—viz. flexion, extension, abduction, adduction, and rota-

tion inwards and outwards, and at the same time its great strength are considered, it may well claim to be regarded as the most perfect joint in the whole body. The reader will form a tolerably clear conception of the relative forms of the acetabulum and the head of the thigh-bone from a glance at the figure, in which the surrounding parts are cut away, and

Hip-joint:

1, 2, 3, pelvic ligaments; 4, 5, the greater and lesser sacro-sciatic foramina; 6, the cotyloid ligament; 7, the round ligament; 8, the cut edge of the lower part of the capsular ligament.

the thigh-bone is drawn out of its socket. The ligaments are usually described as five in number—the capsular (consisting of circular and longitudinal fibres, of which the most important are the *ilio-femoral* or Y-shaped band), *teres* or round, cotyloid, and transverse ligaments. Of these the capsular ligament, supposed to be removed in the figure, is the most important, and extends from the edge of the cup to the circumference of the neck upon which the ball is carried, enclosing the bony parts in a strong sheath. The great use of the capsular ligament is to limit the extension of the hip-joint, and thus to give steadiness to the erect posture. The *teres* or round ligament is in reality triangular rather than round, and has its apex attached to the head of the thigh-bone. The joint is much strengthened by a large number of surrounding muscles, some of which are of considerable power. The experiments of Weber show that atmospheric pressure is the real power by which the head of the femur is retained in the acetabulum when the muscles are at rest.

DISEASE OF THE HIP-JOINT.—Hip-disease differs in many points of importance from other joint-diseases. Its connection with tubercle is more distinctly marked than that of most other joint-diseases, and it almost always occurs before the age of puberty. It comes on, in children or young persons of a tubercular constitution, from very slight causes; thus, it is often traced to over-exertion in a long walk, a sprain in jumping, or a fall; and in many cases no apparent cause can be assigned. In the early stage of the disease the whole of the structures of the joint are inflamed, and by proper treatment at this period the morbid action may be sometimes subdued without any worse consequences than a more or less rigid joint. Usually, however, abscesses form around the joint, and often communicate with its interior; and the acetabulum and the head and neck of the thigh-bone become disintegrated, softened, and gritty. In a still more advanced stage dislocation of the head of the thigh-bone commonly occurs, either from the capsular ligament becoming more or less destroyed, and the head of the bone being drawn

out of its cavity by the action of the surrounding muscles, or from a fungous mass sprouting up from the bottom of the cavity, and pushing the head of the bone before it. It is of extreme importance that the symptoms should be detected in an early stage of the disease.

As the disease advances abscesses occur around the joint. True shortening of the limb now takes place, which at the same time becomes adducted and inverted. From this stage, if the health is pretty good, and the lungs are sound, the patient may be so fortunate as to recover with an ankylosed (or immovable) hip-joint; but the probability is that exhaustion and hectic will come on, and that death will supervene, from the wasting influence of the purulent discharges occasioned by the diseased bone. The duration of the disease may vary from two or three months to ten or more years.

As the treatment must be left entirely in the hands of the surgeon it is unnecessary to say more than that the most important points are *perfect rest* to the affected part, which may be effected in various ways, the internal administration of cod-liver oil and tonics, and the application of counter-irritation by means of an issue behind the great trochanter.

Hipparchus, the first systematic astronomer on record, was born at Nicæa, in Bithynia, and flourished between 160 and 125 B.C. Of his personal history nothing is known except that he observed at Rhodes. The only authority we have regarding his researches is the *Syntaxis* of Ptolemy; from it we learn that Hipparchus discovered the precession of the equinoxes and the eccentricity of the sun's path, determined the length of the solar year and the distances of the sun and moon respectively from the earth, invented the planisphere, drew up a catalogue of 1080 stars, and fixed the geographical position of places on the earth by giving their longitude and latitude. All that we have of his works is a commentary to the poetical description of the stars by Aratus, published in Petavius's *Uranologia* (1630). See the histories of astronomy by Delambre (1817), Wolf (1877), Giant (1852), Berry (1899), &c.

Hipparion, a fossil genus of Equidæ. See HORSE.

Hippius, ZINAIDA NIKOLAYEVNA, Russian poet, novelist, and critic, born in 1870, married Merezhkovsky.

Hippocampus antiquorum.

likeness which the head and neck bear to those of a horse, or perhaps even more strikingly to those of the knight in a set of chessmen. They are all characterised by the prehensile tail devoid of a fin, by which they cling to the stems of sea-

weeds or corals, or even to each other; the body is compressed and more or less elevated; the shields have more or less prominent tubercles or spines; the hinder part of the head forms a flattened crest, terminating above in a prominent knob (coronet); pectoral fins and a dorsal fin are present. The males have a pouch beneath the tail, in which they carry the eggs until they are hatched. As in all other fishes of the order, there is a long snout, and at its extremity a small toothless mouth. The fins vibrate with great rapidity, and present the appearance of a rotating wheel or a delicate waving web, but the animals move only slowly and for a short distance at a time, usually in a half upright posture. There are about twenty species, mostly inhabiting tropical seas; some have a wide area of distribution, as they are not unfrequently carried to great distances by floating materials to which they have attached themselves. *H. antiquorum* of Australia, the Atlantic, and Mediterranean, is occasionally found

Phyllopteryx equeus.

on British shores. The allied genus *Phyllopteryx*, of which three species are known from Australia, is remarkable for its long streaming filaments, which very closely mimic the fronds of the *Fucus* among which it lives.

Hippocampus. See BRAIN.

Hippocras (*vinum Hippocraticum*, 'wine of Hippocrates'), an aromatic medicated wine, formerly much used as a cordial. It was prepared from white wine, flavoured with cinnamon and other spices, lemon peel, almonds, &c., and sweetened with honey or sugar.

Hippocrates, the most celebrated physician of antiquity, was the son of Heracleides, who was also a physician, and belonged to the family of the Asclepiadæ, Hippocrates himself being either nineteenth or seventeenth in descent from Æsculapius. His mother, whose name was Phænarete, was said to be descended from Hercules. He was born in the island of Cos, probably about 460 B.C. He is said to have been instructed in medicine by his father and by Herodicus, and in philosophy by Gorgias of Leontini, the celebrated sophist, and Democritus of Abdera, whose cure, when he was mentally deranged, he afterwards effected. After visiting some parts of Greece, particularly Athens, then at its intellectual zenith, he settled in practice at Cos. He died at Larissa, in Thessaly, but at what age is uncertain, different ancient authors stating it to have been at 85, 90, 104, and 109 years. Clinton (*Fastr. Hell.*) places his death 357 B.C., at the age of 104. We know little more of his personal history than that he was greatly esteemed as a physician and an author, and that he raised the medical school of Cos to a very high reputation. His works were quoted by Plato, who compared

him to Polycletus and Phidias, and by Aristotle, who called him 'the great.' Various stories are recorded of him by Greek writers, to which, being undoubtedly fabulous, it is unnecessary to advert; and we find legends regarding him in the works of Arabic writers, who term him 'Bokrát,' while the European story-tellers of the middle ages celebrate him under the name of 'Ypocras,' and, in defiance of chronology, make him professor of medicine at Rome, with a nephew of wondrous medical skill, whom he despatched in his own stead to the king of Hungary.

The works bearing the name of Hippocrates, and termed the Hippocratic Collection, are more than sixty in number, and were divided by Dr Greenhill into eight classes. The first class comprises works *certainly* written by Hippocrates, including *Prognostica*; *Aphorismi*; *De Morbis Popularibus*; *De Ratione Victus in Morbis Acutis*; *De Aere, Aquis, et Locis*; and *De Capitis Vulneribus*. Some eminent critics doubt the genuineness of some portions of the *Aphorismi*, the work by which Hippocrates is most popularly known. The second class is composed of works *perhaps* written by Hippocrates. They are eleven in number, and one of them is the well-known *Jusjurandum*, or 'Hippocratic Oath.' The others consist of works written before Hippocrates, works whose author is conjectured, works by quite unknown authors, wilful forgeries, &c.

For anything like a full account of his views we must refer to the various writers who have treated of the history of medicine. We can here only mention that he divides the causes of disease into two principal classes: the first consisting of the influence of seasons, climates, water, situation, &c.; and the second of more personal causes, such as the food and exercise of the individual patient. To the influence which different climates exert on the human constitution he confidently ascribes both the conformation of the body and the disposition of the mind, and hence accounts for the differences between the Greek and the less hardy Asiatic. The four fluids or humours of the body (blood, phlegm, yellow bile, and black bile) were regarded by him as the primary seats of disease; health was the result of the due combination (or *crasis*) of these, the disturbance of which produced illness. When a disease was proceeding favourably these humours underwent a certain change (or *cocction*), which was the sign of returning health, as preparing for the expulsion of morbid matter, or *crisis*, these crises having a tendency to occur at definite periods, which were thence called 'critical days.' His treatment of diseases was cautious, and what we now term expectant; it consisted chiefly and often solely in attention to diet and regimen; and he was sometimes reproached with letting his patients die by doing nothing to keep them alive.

The works of Hippocrates were translated at an early period into Arabic. They were first printed in a Latin translation in 1525 at Rome. The first Greek edition (the Aldine) appeared the following year at Venice; an edition by Mercuriali appeared in 1588, one by Foes in 1595, and one by Van der Linden in 1665. Others have appeared under the editorship of Chartier, Kuhn, &c. The best edition, with an admirable French translation, is that of Littre (10 vols. 1839-61). A scholarly edition by Ermerius, with a Latin rendering, was published in 1859-65 at Utrecht, at the expense of the University of Amsterdam. A translation of the *Genuine Works* was published in 1849, in 2 vols., by Dr Adams of Banbury. An edition, with translation, by W. H. S. Jones appeared in the 'Loeb Library' in 1924.

Hippocrène (derived from *hippos*, 'a horse,' and *krênê*, 'a fountain'), a fountain on the northern slope of Mount Helicon, in Greece, sacred to the

Muses and Apollo, which, according to the mythical account, was produced by a stroke from the hoof of the horse Pegasus (q.v.). It is identified with a spring at the modern Makariotissa.

Hippodami'a, the beautiful daughter of Enomaus, king of Pisa, in Elis. It had been predicted to her father that he should be slain by his future son-in-law; he therefore stipulated that every suitor of his daughter should run a chariot-race with him, and that death should be the consequence of defeat. At length Pelops bribed the king's charioteer, and thus succeeded in reaching the goal before Enomaus, who, in despair, killed himself. Hippodamia became by Pelops the mother of Atreus and Thyestes.

Hippodrome (Gr. *hippos*, 'a horse,' and *dromos*, 'a racecourse'), the Greek name for the place set apart for horse and chariot races. Its dimensions were, according to the common opinion, half a mile in length, and one-eighth of a mile in breadth. In construction and all the most important points of arrangement it was the counterpart of the Roman Circus (q.v.). See also OLYMPIC GAMES, CONSTANTINOPLE.

Hippogriff, or HIPPOGRYPH (Gr. *hippos*, 'a horse,' and the word *gryph*, 'griffin'), a fabulous animal, unknown to the ancients, which is represented by modern writers as a winged horse with the head of a griffin. The hippogriff figures as the horse of the Muses, and plays a conspicuous rôle in the *Orlando Furioso* of Ariosto.

Hippolytus, a Christian writer who enjoyed great celebrity in the first half of the 3d century, but of whose personal history we know but little with certainty. He was born most likely about 155-160 A.D., and died about 235 or 236. The first to mention him is Eusebius, who says he was a bishop somewhere, and some writers have placed his diocese in Arabia, while almost all the eastern writers style him Bishop of Rome. He is usually described by modern writers as Bishop of Portus, near Rome, but for this title there is no evidence earlier than the middle of the 7th century. He may have been a native of the East, and he is said to have been a disciple of Irenæus; but this may have been either in Asia Minor, in Gaul, or in Rome itself, which Eusebius tells us that Irenæus visited about 178. An entry in the Liberian Catalogue of bishops of Rome tells that Pontianus the bishop and Hippolytus the presbyter were transported as exiles to the mines of Sardinia, where ere long they perished, their bodies being carried back to Rome. Prudentius (5th century) gives a different but much less credible account of the martyrdom of Hippolytus, according to which he was torn in pieces by wild horses like the Hippolytus of mythology. He tells us that he was infected with the Novatian heresy, but recanted on the way to martyrdom. Such was the unsatisfactory state of knowledge when the recovery at Mount Athos by Minoides Mynas in 1842 of the treatise against heresies cast fresh light upon Hippolytus as its presumptive author. It was contained in a 14th-century MS., and when published by Miller in 1851 was recognised as forming part of the fragment ascribed to Origen and entitled the *Philosophumena*. Its appearance opened up a grave discussion. The Origenistic authorship was soon abandoned, and attempts were made by Baur to ascribe it to Gaius, by De Rossi to Tertullian, by Armellini to Novatian. Jacobi advanced the claims of Hippolytus, and this theory was supported by Bunsen and Wordsworth, and so conclusively proved by Döllinger as to persuade almost every scholar save Lipsius, who still continued to describe the author as Pseudo-Origenes.

From the treatise itself we learn that the author

lived at Rome, and took an active part in church affairs under the bishops Zephyrinus and Callistus. Dollinger points out that throughout Hippolytus never recognises Callistus as bishop, and treats him only as the founder of a school. Besides he assails his moral character and his antecedents, charging him with dishonesty, with criminal laxity of discipline, and with the Patripassian heresy; while Callistus again retorted upon his opponent with a counter-charge of Ditheism. Dollinger held that Hippolytus claimed to be the real Bishop of Rome himself, and that he was thus the first antipope in the history of the Roman Church. This would explain the circumstance that a writer so learned and outstanding as Hippolytus could be taken by the Eastern Church for the actual Bishop of Rome, while to western writers who did not receive him as such he seemed guilty not only of schism but of heresy. But the grave difficulty remains of being obliged to believe that a schism so serious, headed by the most illustrious theologian of the time, and lasting at the very lowest five or six years, could have occurred without its being known outside of Rome, and still further could be utterly forgotten for fifteen centuries. Again, if Hippolytus had headed a party so inimical to the authority of the bishop, how comes it that his name has descended without a stain as that of a saint and a martyr? Dr Salmon suggests the explanation that Hippolytus may have been the head of the Greek Christians at Rome, and that as such he may have been specially entrusted with some episcopal functions—an anomalous state of matters which would come to an end with the necessity for it. His attacks on Callistus were written in Greek for Greek-speaking people, hence the faintness of the impression they made upon the Latin world; while at the same time most of the recollections of the earlier part of the century were lost in the severity of persecution under Decius and Valerian. At anyrate the state of the controversy shows that in the 3d century Christians elsewhere than at Rome itself were not much interested in the question who was Bishop of Rome at all. Hippolytus seems to have championed the severe and ultra-orthodox party in the Roman Church, and at the least to have been bitter and prejudiced as a controversialist. The ecclesiastical charges brought against Callistus in this famous treatise are his giving easy absolution to sinners excommunicated by Hippolytus and others, admitting digamists and trigamists to the ranks of the clergy, allowing the clergy to marry, and permitting Christian ladies to contract illegal marriages with men of inferior social rank.

Hippolytus was one of the most voluminous writers of the ancient church, comparable in this regard with Origen, and his works comprise treatises on exegesis, homiletics, apologetics, dogmatics, church law, and chronology. But most of them survive only in fragments of the Greek originals or in translations, mostly Slavonic. The best preserved are commentaries on Daniel and the Song of Songs, the oddly named *Philosophumena* (or *Refutation of All Heresies*), *On Christ and Antichrist*, which have been recently edited by Bonwetsch, Achelis, and others (1897-1902). The then extant writings were collected by Fabricius (1716-18), and were printed by Gallandi (in *Bibl. Vet. Pat.*), Migne (*Patr. Græca*), and Lagarde (1858). The so-called *Canons of Hippolytus* (extant in an Arabic version of a Coptic translation) were probably credited to him simply because he was known to have written on such subjects (ordination, admission of converts, virginity, baptism, the eucharist, fasting, &c.), and are more probably Græco-Egyptian in origin. English translations of the *Refutation*, as well as the other extant works and fragments, may be found in Clark's 'Ante-Nicene Christian Library.' See Bunsen, *Hippolytus and his Age* (2d ed. 1854); Wordsworth, *St Hippolytus and the Church of Rome*; (2d ed. 1880); Dollinger, *Hippolytus and Callistus* (1853; trans. 1876); Volkmar, *Hippolytus u. die Römischen*

Zeitgenossen (1855); Harnack, *Zur Quellen-kritik der Geschichte des Gnostizismus* (1873-74); Ficker, *Studien zur Hippolytfrage* (1893); Achelis, *Hippolytstudien* (1897); Neumann, *Hippolytus von Rom* (1902-13); Adhémar d'Alès, *La Théologie de Saint Hippolyte* (1906); and the article in Herzog-Hauck.

Hippophagy. Hippophagi (Gr., 'eaters of horse-flesh') was a name given by the Greeks to a Scythian people, living north-east of the Caspian Sea, and to a Sarmatian tribe north of the Euxine. In some parts of modern Europe horse-flesh is a regular and wholesome article of diet. In France a society of hippophagists was formed under the auspices of Geoffroy St Hilaire; in 1866 horse-flesh was put on sale in the Paris markets, and during the siege was gladly eaten. In Britain an act was passed in 1889 regulating the sale of horse-flesh, requiring that all horse-flesh (or flesh of asses and mules) exposed for sale shall be expressly so described in legible and conspicuous characters, and imposing a penalty of £20 on any one breaking this rule, or giving any one horse-flesh who has asked for meat other than horse-flesh.

Hippopotamus (Gr., 'river-horse'), a genus of artiodactyle ungulate mammals, constituting a family by itself. Till of late only one species was known as now existing, although the fossil remains of others indicate the greater abundance and wider distribution of the form in other periods of the earth's history. The largest and best-known species, *H. amphibius*, is—or, within historic periods, has been—found in almost all parts of Africa, to which

Hippopotamus amphibius.

quarter of the globe it is entirely confined. A smaller species, *H. liberiensis* (distinguished by some as a distinct genus, *Cheropsis*), was described in 1844 as an inhabitant of the rivers of western Africa within the tropics, and differs from the common species, and from all the fossil species, in having only two incisors, instead of four, in the lower jaw. But as the missing teeth occasionally exist there seems no valid reason for separating this form generically. The common hippopotamus is one of the largest of existing quadrupeds, the bulk of its body being little inferior to that of the elephant, although its legs are so short that its belly almost touches the ground, and its height is not much above five feet. It is extremely aquatic in its habits, living mostly in lakes or rivers, often in tidal estuaries (where the saltness of the water compels it to resort to springs for the purpose of drinking), and sometimes even in the sea, although it never proceeds to any considerable distance from the shore. Its skin is very thick—on the back and sides more than two inches; it is dark brown (albino and piebald individuals have been seen), destitute of hair, and exudes a reddish fluid, which has been said to have given rise to the legends of

sweating blood. The tail is short. The feet have each four toes, nearly equal in size, and hoofed. The neck is short and thick. The head is very large, with small ears, and small eyes placed high, so that they are easily raised above water, without much of the animal being exposed to view. The muzzle is very large, rounded, and tumid, with large nostrils and great lips concealing the large front teeth. The hippopotamus cuts grass or corn as if it were done with a scythe, or bites with its strong teeth a stem of considerable thickness neatly through. The skull, while it is distinguished by remarkable peculiarities, corresponds in the most important characters with that of the hog. The respiration of the hippopotamus is slow, and thus it is enabled to spend much of its time under water, only coming to the surface at intervals to breathe. It swims and dives with great ease, and often walks along the bottom, completely under water. Its food consists chiefly of the plants which grow in shallow waters and about the margins of lakes and rivers; and it probably renders no unimportant service in preventing slow streams from being choked up by the luxuriance of tropical vegetation, the effect of which would, of course, be an increase of the extent of swampy land. It often, however, leaves the water, chiefly by night, to feed on the banks, and makes inroads on cultivated fields, devouring and trampling the crops. It is a gregarious animal; and the havoc wrought by a herd of twenty or thirty is very great, so that wherever cultivation extends war is waged against the hippopotamus, and it disappears from regions where it formerly abounded. Thus it is no longer found in Lower Egypt, although still abundant farther up the Nile. It is taken in pits, which are dugged in its usual tracks; it is killed by poisoned spears, is pursued by means of canoes, is harpooned, and is shot. The flesh is highly esteemed; the fat, of which there is a thick layer immediately under the skin, is a favourite African delicacy, and when salted is known at the Cape of Good Hope as *Zee-koe speck* ('Lake-cow bacon'). The tongue and the jelly made from the feet are also much prized. The hide is used for a variety of purposes; and the great canine teeth, which sometimes weigh 8 or even 12 lb., are particularly valuable as ivory, and are a very considerable article of African commerce.

The hippopotamus is lively and playful in its native waters; it soon learns to avoid man; and, when it cannot retire among reeds for concealment, it dives and remains long under water, raising only its nose to the surface when another breath becomes necessary. The female may sometimes be seen swimming with her young one on her back. The hippopotamus is generally inoffensive, but is occasionally roused to fits of rage, in which it becomes extremely dangerous, particularly to those who pursue it in boats. The voice is loud and harsh, and is likened by Burckhardt to the creaking and groaning of a large wooden door. That the animal is capable of being tamed, and of becoming much attached to man, has been sufficiently proved by the instances of living specimens in London and Paris. The hippopotamus sometimes appeared in the spectacles of the ancient Romans. It is very generally supposed to be the Behemoth of the book of Job. The first specimen brought to Europe in modern times, a young one from the Nile, arrived in London in 1850. One reached England alive in 1884, and was sold for £2300. That in the Regent's Park collection in 1904 cost £500 when an infant. The range of the animal has of late been enormously restricted.

A number of species of hippopotamus have been described from the later Tertiary strata; but in those times the distribution was not, as it is now,

limited to the African continent. Their remains have been found in India and Madagascar as well as Europe. They occur in fresh-water marls, and in the bone-caves, into which they had been carried for food by the carnivorous animals that used the caves as dens. One species found in England and in considerable abundance in the southern countries of Europe was of a size as much greater than the living species as its companion, the mammoth, was greater than the living elephant. On the other hand, there are pigmy hippopotami in West Africa at the present day. See Lydekker's *Game Animals of Africa* (1908).

Hippuric Acid. See URINE.

Hippurites, a remarkable genus of fossil bivalves, with numerous species, peculiar to the Cretaceous strata. The external form of the shell is anomalous; the right valve is very large, and elongated into a cone, while the left valve is inconspicuous, often like a lid, a Hippurite, and perforated by radiating canals.

Hiring is of two kinds—the hiring of things, as of household furniture, and the hiring of work. In the first kind, it is the duty of the person letting out the thing to deliver it to the hirer, to refrain from interfering with the hirer's use of the thing during the subsistence of the contract, to do nothing to deprive the hirer of the use, to warrant that the thing hired is fit for the use for which it is let, and to keep the thing free from faults and defects inconsistent with the proper use of it, and in suitable order and repair. The hirer acquires no right of property in the thing hired, but acquires its possession and the exclusive right to its use for the period of the agreement. He has to use the thing well and with care, not to put it to any other use than that for which it is let, to restore it at the expiry of the time agreed on, and to pay the stipulated hire. In hiring on the 'hire-purchase' system—as where a piano is handed over by its owners to a purchaser under the conditions that a certain sum shall be paid periodically as hire, and that after a certain number of such periodical payments have been made the piano shall become the property of the person making the payment—it is always a question whether the contract is legally a contract of hiring or a contract of sale. The answer will depend upon the particular terms of each agreement. These are usually so framed as to make the contract not one of hiring, but one of sale with a suspensive condition that the thing delivered shall not become the property of the person to whom it is sold until he has paid the full number of periodical payments bargained for. By statute, however, the rights of one who has purchased the article in good faith or taken it in pledge from the 'hirer' are safeguarded, such a sale with suspensive condition being in this respect assimilated to an ordinary unconditional sale. Hiring of work may be subdivided into the hire of services, as where a shoemaker is employed to mend shoes; the hiring of care in custody, as where warehousemen or wharfingers are employed to store things; and the hiring of the carriage of goods. See LANDLORD AND TENANT, INN, MASTER AND SERVANT, CARRIER, &c.

Hirn, YRjö, Finnish æsthetician, was born at Villmanstrand (Lappeenranta) in 1870. His education included much study abroad, chiefly in England, France, and Italy. Having worked for a time in the library of the university of Helsingfors, he was in 1898 appointed to the teaching-staff, and became in 1910 professor of Æsthetics and Modern Literature. Among his numerous works

are *Origins of Art* (1900; Eng. trans. 1900); *The Sacred Shrine: a study of poetry and art of the Catholic Church* (1909; Eng. trans. 1912); *Det estetiska livet* ('The Aesthetic Life,' 1913); *Jonathan Swift* (1918); *Dr Johnson and James Boswell* (1922).

Hiroshige (1797–1858), a Japanese landscape artist, who, although a painter of merit, devoted himself almost entirely to the production of colour-prints, and, after Hokusai, was probably the most famous member of the *Ukiyo-ye* or popular school. He studied under Hōyō, and after a period spent in Kyoto he returned to Tokyo, where, on his death, he was succeeded by Hiroshige II. and Hiroshige III., artists who had been his pupils, and to whom, in the Japanese fashion, he had given his name. It is very difficult to differentiate their work, as all is of surpassing merit. A genius and breadth of outlook seldom equalled in the history of art, and never excelled, was brought by these artists to bear on the portrayal of landscape through the process of block printing in colour. Their work deals almost entirely with the country round Tokyo and the old high-road—the Tokaido—to Kyoto. 'Through the Rice-fields' is a magnificent example of Hiroshige's work.

See Capt. F. Brinkley, *The Art of Japan* (1901); E. F. Fenollosa, *Epochs of Chinese and Japanese Art* (1920); Louise Norton Brown, *Block Printing and Book Illustration in Japan* (1924).

Hiroshima, a seaport of Japan, at the south-western extremity of Honshū, and 190 miles W. of Osaka. There are bronze and lacquer ware industries, and the place is an important commercial centre. Pop. 160,000. Opposite the city is the sacred island of Itaku-Shima, dedicated to the goddess Bentin, and one of the three wonders of Japan; the chief temple dates from 587.

Hirschberg, in Lower Silesia, 78 miles WSW. of Breslau, is the centre of the extensive textile, lace, paper, and other manufactures of the district; pop. (1885) 15,622; (1919) 21,428.

Hispania. See SPAIN.

Hispaniola ('Little Spain'). See DOMINICAN REPUBLIC and HAITI.

Hissar, a province of Bokhara, from which it is separated by a southern offset of the western prolongation of the Thian-Shan Mountains. It is traversed by streams which flow in general S. or SW. to the Oxus or Amu-Daria. The inhabitants are chiefly Usbegs and Tajiks. The capital is the town of Hissar, with 10,000 inhabitants.

Hissar, the capital of a district in the Punjab, on the Western Jumna Canal, 102 miles W. of Delhi; pop. 20,000.—The district of Hissar lies on the western verge of the Bikanir desert.

Hissarlik. See TROY.

Histology is the science which classifies and describes the structural or morphological elements in the solids and fluids of organised bodies; and is almost identical with general minute anatomy and with microscopic anatomy. Although its origin may be traced to the times of Malpighi (1628–94), who discovered the blood-corpuscles, and of Leeuwenhoek (1632–1723), who, with comparatively imperfect optical means, added much to our knowledge of the minute structure of the tissues, it never made any definite progress till the second decennium of the 19th century, when the compound microscope began to assume its present improved form. It was by means of this microscopico-chemical examination that the structure of the different horny tissues was first clearly exhibited, and it was thus proved that nails, cow's horn, and whalebone are aggregations of individual cells. Other famous names are those of Bichat, Schleiden, Schwann, Remak, Kölliker,

Virehow, Donders, Harting, Billroth, Huxley, Schäfer. Portions of animal histology are dealt with in our articles on BLOOD, BONE, BRAIN, CELL, GLAND, MUSCLE, NERVOUS SYSTEM, &c.; and see ANATOMY. For Vegetable Histology, see BAST, LEAF, TISSUES, WOOD, &c.

History is, according to the great Oxford Dictionary, 'that branch of knowledge which deals with past events, as recorded in writings or otherwise ascertained; the formal record of the past, especially of human affairs or actions; the study of the formation and growth of communities and nations.' Even in this limited sense (and as distinguished from 'natural history' and the like), the field is vast and the possible methods are very various. In any reasonable attempt to give a true representation of the past there are two main processes—the investigation and discovery of the truth, which is a branch of science, controlled by the rules of evidence; and the literary presentation of the result, which is a branch of art. From the beginning, the writing of history has combined in various proportions both procedures. In some writers history tends to be narrative largely coloured by fable and legend, poetry and imagination, patriotic and religious prejudice, with no conscientious and systematic weighing of evidence, and little of the critical spirit. Some famous historians have been stern moralists, preaching to their contemporaries by passing strict judgment on the deeds and characters of the past. More recently it has been argued that the historian should be a narrator only, wholly detached and impartial, tracing causes and results, but avoiding as much as possible moral judgments from his own (i.e. the modern) standpoint, and eschewing alike the emotional, rhetorical, and didactic method of treatment, with the not infrequent result that historical work becomes a detailed and tedious collection or consecution of apparently unrelated and all but insignificant facts and data. There is of course no reason why literary history should not be strictly scientific in method, nor why scientific history should fail to take fascinating colour from all the elements of romance within its province—from deeds of high enterprise, noble thoughts, the triumphs of art and literature. As a science history—primarily inductive; and if deductive, then only within strict limits—collects and collates the facts; arranges them in causative or other sequence; weighs the evidence for and against them; criticises their significance; interprets them and sums up any lessons thence to be derived; and provides more or less rigorous documentation. The material to be dealt with includes not merely annals, chronicles, biographies, contemporary letters, and documents of every kind—literary, poetic, religious, or scientific—sagas, legends, and traditions, written or unwritten; but inscriptions, coins, medals, statues, paintings, buildings, and human remains of almost all sorts. By way of archæology, the record of human civilisation passes from the prehistoric through the proto-historic to the fully historic period; and for practical purposes history is (popularly rather than scientifically) divided into ancient, mediæval, and modern history. Ancient history—though there are no absolute lines dividing ancient from mediæval, or mediæval from modern—is conveniently assumed to end with the overthrow of the Roman empire in 476 A.D., and mediæval history to extend from 476 to about the beginning of the 16th century; thenceforward (roughly from the later Renaissance and the beginnings of the Reformation) events are spoken of as falling into the domain of modern history.

(1904); Langlois and Seignobos, *Introduction to the Study of History* (trans. 1908); Gooch, *History and Historians in the 19th Century* (1913); Shotwell, *Introduction to the History of History* (N.Y. 1922), and Croce's *Theory and History of Historiography* (1924).

Hit (anc. *Is*), a town of Iraq, on the Euphrates, 85 miles WNW. of Bagdad, has pits of bitumen, which have been worked from time immemorial, and naphtha-springs. It was occupied by the British in 1918. Pop. 5000.

Hitchcock, EDWARD (1793-1864), born at Deerfield, Massachusetts, was successively Congregational pastor in Conway, Massachusetts, and professor and president of Amherst College. He was state geologist of Massachusetts and of Vermont in 1857-61, and published reports and a book on the *Ichnology of New England*. His *Religion of Geology* (1851) had a very wide circulation, as also his *Elementary Geology* (1840).

Hitchin, an urban district of Hertfordshire, with an important railway junction, a fine old parish church, and a free school (1622), trades in corn, malt, beer, straw-plait, and lavender-water; pop. (1861) 5258; (1921) 13,535.

Hitopade'sa (Skt. 'salutary instruction'), a Sanskrit collection of fables of relatively modern date, based by its author, Sri Nārāyana, on the Panchatantra and other similar works, known in India as *Nitisdstras* (see PANCHATANTRA). There are English translations by W. Jones (1807), F. Johnson (1848), and C. Wilkins (1885).

Hitteren, an island off the west coast of Norway; area, 203 sq. m.

Hittites, the English name of a people called Khatti, or Khati, in the cuneiform and Egyptian inscriptions and Heth in the Old Testament, who founded an empire in Asia Minor and Syria, which contended on equal terms with Egypt and Assyria, and exercised an important influence on the history of the ancient East, upon Canaan and the Israelites; though almost all recollection of their existence had passed away before the age of the classical writers. Until the decipherment of the Egyptian and Assyrian monuments, our knowledge of them was confined to a few notices in the Old Testament. A Hittite tribe was established at Hebron, in the south of Palestine, in the time of Abraham, who purchased from it the field of Machpelah. Esau married Hittite wives, and Heth, the 'Hittite,' occupies the leading place among the inhabitants of Canaan (Gen. x. 15). The traitor who betrayed Beth-el to the Ephraimites migrated to 'the land of the Hittites' (Judges i. 26), and the kingdom of David extended to 'Kadesh of the Hittites' (the correct reading in 2 Sam. xxiv. 6, instead of 'Tahtim-hodshi'), i.e. Kadesh on the Orontes, at the southern end of the Lake of Homs. Uriah, the first husband of Bathsheba, was a Hittite, and in the time of Jehoram the belief that 'the kings of the Hittites' were coming to the aid of the Israelites raised a panic in the Syrian army (2 Kings vii. 6). Solomon's traders imported horses for Egypt from the Hittite country (1 Kings x. 29), which, as we know from other sources, would be in the neighbourhood of Cilicia and Cappadocia.

Egyptian Evidence.—On the monuments of the Nineteenth Egyptian dynasty (in B.C. 1300) the Hittites appear as the possessors of an empire which extended through Asia Minor to the Asiatic frontiers of Egypt. Already in the age of the Twelfth dynasty (B.C. 2500) a body of them seems to have been settled in southern Palestine, and Thothmes III. of the Eighteenth dynasty (B.C. 1500) had received tribute from 'the Greater Hittite land.' When the letters found at Tel-el-Amarna, in Upper Egypt, were written (B.C. 1400), the Hittites were

threatening the Egyptian possessions in Syria and Palestine, and with the fall of the Eighteenth dynasty a few years later 'the king of the Amorites' became a vassal of the Hittite monarch, and Syria and Canaan alike passed into Hittite hands. The way had been prepared by the settlement of bands of Hittite mercenary soldiers in Palestine, whose leaders became governors or kinglets of the cities they were hired to defend. The Jebusites of Jerusalem appear to have been one of these bands.

With the rise of the Nineteenth dynasty the Egyptians endeavoured to recover the ground they had lost in Asia. Seti I. and his son Ramses II. carried on a long war with the Hittite empire. Kadesh, on the Orontes, was taken by storm; but at last, in the twenty-first year of Ramses II., peace was concluded between the two powers, the boundary line between them being drawn where the northern frontier of Israel afterwards ran, and special provisions being made about political refugees, trade, and similar matters. Khattu-sil was at this time the Hittite king, and fifteen years later his successor, Dudkhallia, gave his daughter in marriage to the Pharaoh, and himself paid an official visit to the Egyptian court.

Babylonian and Assyrian Evidence.—The Egyptian records are supplemented by those of Babylonia (q.v.) and Assyria (q.v.). Like 'the king of the Amorites,' 'the king of the Hittites' plays an important part in the astrological work compiled under Khammu-rabi, the Amraphel of Gen. xiv., and about 150 years later the Hittites invaded Babylonia and overthrew the dynasty of Khammu-rabi. In a later age the Assyrians found the Hittites blocking their way to the metalliferous mines of Asia Minor and the trade of the Mediterranean, and accordingly made determined efforts to destroy the various kingdoms into which the Hittite empire had broken up. Foremost among these were the land of the Khattinā, on the southern side of the Gulf of Antioch; Khali-rabbat (or -galbat), with its capital Malatiyeh in Asia Minor, near the Upper Euphrates; and, above all, the wealthy city of Carchemish, now *Jerablus*, which commanded the ford across the Euphrates. The war begun by Tiglath-pileser I., B.C. 1100, was continued at intervals down to the time when Tiglath-pileser III. destroyed the Khattinā and Sargon, in B.C. 717, captured Carchemish, and made it the seat of an Assyrian prefect. From this time forward the Hittites disappear from history.

Native History.—The original seat of the Hittites was in eastern Asia Minor. Here, at Boghaz-Keui, north of the Halys, was their northern capital, where excavations were carried on by the Germans in 1906-7. They have laid bare the acropolis and palace, as well as the temples of the city, and their excavations have resulted in the discovery of at least two libraries of clay tablets inscribed with cuneiform characters, some of them being in Assyrian and others in the native Hittite language. The documents relating to international politics are generally written in Assyrian, and they have thrown a large amount of light on Oriental history during the time of the Hittite empire. This was founded by Subbiluluma (Egyptian Sapa-lul), the son of Khattu-sil I., king of Kussar, about B.C. 1400. He annexed Syria, established a protectorate in Mesopotamia, and extended Hittite dominion throughout Asia Minor, while Boghaz-Keui was surrounded by massive walls and a great palace built within them. After a long reign he was succeeded by his son, Arandas, who was displaced by his brother, Mur-sil. Mur-sil built a second palace at Boghaz-Keui, and turned his arms against the north-east. Southward he was unfortunate; Assyria overran Mesopotamia and raided Malatiyeh, while Egypt re-

conquered Palestine. His son, Mutallu (in B.C. 1300), accordingly, made every effort to crush the Egyptians; his vassals and allies were summoned from all parts of Asia Minor and Syria, and a battle took place at Kadesh, which, though unfavourable to the Hittite king, checked the farther advance of his enemies. It was followed, however, by the revolt of the Amorites and the murder of Mutallu, whose brother, Khattu-sil II., now became 'the Great King,' and married Putu-hippa, the queen of the neighbouring state of Kizwadna. The Amorites were brought back to obedience, a daughter of Khattu-sil being given in marriage to their king, and a treaty made confining the succession to the Amorite throne to her descendants. This was followed by the treaty with Ramses II., with the conclusion of which the queens of the two monarchs had much to do, and by a sort of protectorate over Babylonia, in return for which the Hittite king promised to assist the Babylonians against the rising power of Assyria. Hittite influence was re-established in Mesopotamia, and the Triple Alliance of Hittites, Egyptians, and Babylonians secured peace throughout the Oriental world for nearly half a century.

Khattu-sil II. was succeeded first by his son, Dughalia (Tidal in the O.T.), and then by his grandson, Arnuanta. Then came the invasion of Asia Minor by the 'northern-barbarians'—Moschians, Phrygians, and the like; Boghaz-Keui was taken and sacked, the Hittite empire destroyed, and its place taken by a number of minor states (in B.C. 1200). The barbarians poured southward through Syria, but were finally overthrown and decimated, partly on the sea and partly on the land, by Ramses III. of Egypt. A new Hittite empire arose, which had its seat in southern Cappadocia, called Kas or Kusa, and embraced Cilicia and northern Syria. Most of the hieroglyphic Hittite texts belong to this later empire, which, however, did not last long.

Physical Features and Social Life.—The Hittites were a thick-set people, with yellowish skin, black hair and eyes, beardless face, receding forehead and chin, and protrusive nose—a physical type which is still found in Cappadocia. They wore tunics, skull-caps, and tall tiaras, twisted the hair into a pigtail, and were shod with buskins with upturned toes, a mark of their northern and mountainous origin. Their usual weapon was a dirk, but they were also acquainted with the spear and bow, as well as the scythe-like *khopesh* of the Egyptians. The figure of an Amazon, armed with axe and curved dirk, is carved on one of the gates of Boghaz-Keui. At Eynk, near Boghaz-Keui, there are representations of musicians with bagpipe and guitar and of masons with a ladder. The people sat on chairs and had tables with crossed legs. They had invented a peculiar system of hieroglyphic writing, which is but partially deciphered. Examples of it are met with from Hamath, in the south, to the coasts of Lydia, in the north-west. They are often accompanied by sculptures in a peculiar style of art, which was originally derived from Babylonia, but was modified in a special way by the Hittite artists. The Hittite language was inflectional, but not Indo-European, though the nominative and accusative of the noun ended in *s* and *n*, and the third person of the verb in *t*.

Trade and Religion.—Hittite trade was mainly in copper, lead, and more especially silver, from the mines of the Taurus; also in horses, chariots, and ivory. So important was it that the maneh of Carchemish was a standard of currency throughout Asia Minor. Through the Hittites the modified culture and art of Babylonia were carried to Greek lands, and to a lesser extent to Canaan. Their painted pottery has been found in the pre-Israelitish

remains at Lachish and Gezer. The primitive objects of Hittite worship were fetishes—a dirk, an axe, a meteoric stone, and the like. After the introduction of Babylonian culture, through the establishment of Assyro-Babylonian trading and military colonies in the neighbourhood of Kaisariyeh in Cappadocia in the heart of Asia Minor (in B.C. 2500), Babylonian religion, with its anthropomorphic conception of the deity, made its way into Asia Minor. The Babylonian trinity became a trinity of the goddess-mother, who represented the earth; her son Attys, the embodiment of vegetation; and the father-god, who was identified with the Semitic Hadad. The forms of the mother-goddess were as numerous as the cities or counties which she represented, and which were deified in her. She was accordingly depicted with a mural crown, and occupied the first place in religious worship. Near Boghaz-Keui are rock-sculptures, representing the religious ceremonies which accompanied the yearly celebration of the union of the goddess Mamis with the god Khattus and the mysteries performed in the sacred cave of their son Attys. The priest of Attys was also high-priest and king, and after the fall of the empire the royal functions became more and more merged in those of the priest. Attys was identified with the sun-god, worshipped under different forms in the different Hittite states. The sacred city, or city of refuge, was of Hittite origin, as was probably also the custom of representing the deities riding on the animals sacred to them.

Discovery of Hittite Place in History and Decipherment of Inscriptions.—The discovery of the existence of the Hittite empire and the important part it played in ancient Oriental history is of recent date. Inscriptions in a peculiar form of hieroglyphic writing were found at Hamath, which W. Wright and Sayce suggested might represent the Hittite script referred to on the Egyptian monuments, and the suggestion was confirmed by the identification (in 1875) of the site of Carchemish, the southern capital of the Hittites, and the discovery of similar inscriptions among its remains. In 1879 Sayce pointed out that inscriptions in the same script and accompanied by rock sculptures in a peculiar style of art were to be found at Ivriz, north of the Cilician Gates, as well as in the neighbourhood of Boghaz-Keui, north of the Halys, and that the art accompanying them also characterised certain monuments of Asia Minor, the origin of which had been an enigma. One of these was the figure of a warrior in the pass of Karabel, near Smyrna, which had been supposed by Herodotus (II. 106) to be a representation of the Egyptian Sesostris, and to which an inscription was attached, supposed to be in Egyptian hieroglyphs. Sayce concluded that all these monuments were of Hittite origin; that the Hittite kingdom had its seat in Asia Minor, and not in Syria as had been imagined; and that there must have been not only a kingdom but also an empire, the centre of which was at Boghaz-Keui. He further staked the truth of the theory on the hieroglyphs at Karabel turning out, when properly copied, to be Hittite and not Egyptian, and a squeeze which he took of them a few weeks later proved that he was right. Shortly afterwards Sir W. Ramsay showed that the pre-Hellenic roads of Asia Minor converged at Boghaz-Keui, and Dr Dennis, the British Consul at Smyrna, discovered a Hittite inscription beside the so-called figure of Niobé on Mount Sipylus.

The decipherment of the hieroglyphs, the use of which by the Hittites preceded their adoption of the cuneiform characters of Babylonia, has been slow. In 1881 Sayce published a short bilingual inscription (in hieroglyphs and cuneiform) on a seal, but it did not prove very helpful, and for

more than twenty years the problem of decipherment was attacked in vain. Since 1903, however, Sayce has succeeded in partially reading the inscriptions; the values of many of the characters have been determined through the geographical names occurring in the texts, and with the multiplication of materials the signification of many of the ideographs has been made out. When the thousands of fragmentary tablets in cuneiform found at Boghaz-Keui have been made available, the progress of decipherment will doubtless be rapid, more especially as in some cases the cuneiform text of these is accompanied by hieroglyphs. The excavations recently carried out by Mr Hogarth, for the British Museum, at Carchemish have resulted in the discovery of the ruins of a Hittite palace with sculptures and hieroglyphic inscriptions, and have shown that the Hittite occupation of the site was preceded by a neolithic period when the place was the residence of a semi-civilised population.

See Sayce, *Monuments of the Hittites* (1881), *The Hittites* (3d ed. 1903); W. Wright, *Empire of the Hittites* (1884); Perrot and Chipiez, *History of Art*, vol. ii. (Eng. trans. 1890); Messerschmidt, *Corpus Inscriptionum Hittiticarum* (1900-6), Hogarth, *India and the East* (1909); Garstang, *Land of the Hittites* (1910); Hogarth in the *Cambridge Ancient History*, vol. ii. (1924), and works referred to there.

Hitzig, FERDINAND (1807-75), rationalist critic, born in Baden, in 1833 became professor of theology at Zürich, and in 1861 at Heidelberg. He wrote commentaries on various books of the Old Testament; also books on the Alphabet, the Philistines, and the history of Israel.

Hung-nu. See MONGOLS, TURKS.

Hivites, a Canaanitish people driven out of Palestine by the Hebrews, the main body of which lived in the region from Lebanon and Hermon to Hamath, but who had colonies, apparently isolated, in southern Palestine, as at Gibeon. The Hebrew writers seem to have confounded Hivites with Hittites, Horites, and other aliens.

H'Lassa. See LHASA.

Hoadly, BENJAMIN, born at Westerham, in Kent, 14th November 1676, became tutor at Catherine Hall, Cambridge, and as rector of a London charge figured amongst the principal 'rationalist' controversial writers of the 18th century, defending civil and religious liberty against both crown and clergy. He carried on a controversy with Atterbury, as also with Sacheverell, and was made a hero of by the Whigs, being in 1710 presented to the rectory of Streatham in Surrey, and in 1715 made Bishop of Bangor. In 1717 he preached before the king a sermon on the text, 'My kingdom is not of this world,' showing that Christ had not delegated his powers to any ecclesiastical authorities. Out of this originated the famous Bangorian Controversy (q.v.), which produced such an extraordinary number of pamphlets (in July 1717 alone no less than seventy-four appeared), and led to the indefinite prorogation of Convocation (q.v.). In 1721 Hoadly was transferred to the see of Hereford, in 1723 to Salisbury, and 1734 to Winchester. He died 17th April 1761. His *Collected Works*, with Life prefixed, were published in 1773.

Hoang-ho ('Yellow River'), or simply Ho, one of the principal rivers of China, more than 3000 miles in length, rises south of the Kuen-Lun Mountains, and has a tortuous course, described in the article CHINA. From Chih-li it used to flow eastward to the ocean, 650 miles distant, in 34° lat.; but in 1851-53 this wayward and turbulent stream, which is said to have shifted its course nine times in 2500 years, turned in a north-easterly direction to the Gulf of Pechili, some 500 miles north of its former mouth, the mountainous province of Shan-tung lying

between the two. The river is little used for navigation, Chinese vessels being unable to stem its impetuous current. In some parts of its eastern course, as in the case of the Po, the river-bed is above the great plain through which it passes; and the yielding of the embankments has been a frequent cause of desolation to extensive districts of country.

Hoar-frost. See DEW

Hoatzin, or HOACTZIN. See OPISTHOCOMUS.

Hobart (formerly called Hobart Town and Hobarton), the capital of Tasmania, stands on the estuary of the Derwent, about 12 miles above its mouth. The city is spread over the eastern foothills of Mount Wellington, which forms a majestic background to it, just as Table Mountain does to Cape Town. The harbour, developed out of a small cove on the western bank of the river, is easy of access, well sheltered, and capable of receiving the largest ships yet built. Among the principal public buildings are the houses of parliament and government offices, an Anglican and a Roman Catholic cathedral, a museum in a wing of which is the art gallery, a town hall in which the public library is also ensconced, and the usual hospitals, schools, and clubs. The Domain, a public park of 1000 acres, stretching along the river-bank, contains gardens. Electric tramways connect the city itself with the suburbs of Glenorchy, Newtown, and Sandy Bay. The water-supply, derived from streams which drain the slopes of Mount Wellington, is stored in three large reservoirs (holding over 300 million gallons in all), and distributed by gravitation; the sewerage system covers the city, Newtown, and Queensborough, but in the two latter areas is still incomplete. Both for its own natural beauties and as the centre of a cool and exceptionally interesting tourist district, Hobart is in the Australian summer much frequented by visitors from other parts of the Commonwealth, the annual visit of the Australian squadron being usually timed for the same period. Apart from this tourist traffic, the chief industry of the district is apple-growing, which is so important that in March and April British mail-steamers call regularly at Hobart on their homeward voyage to secure the crop. Hobart is connected by rail with Launceston (133 miles), Burnie, on the north-west (222 miles), St Mary's, on the east coast (145 miles), and Apsley (43½ miles); it has also steamer services direct to Sydney and Melbourne, and has in normal times been used as a port of call by British vessels trading round the Cape to New Zealand. Pop. (1911) 40,200; (1921) 52,391—about a quarter of the population of the whole State, which is the smallest proportion for any State capital in the Commonwealth.

At Claremont, on the Derwent, 7 miles north of Hobart, the firm of Cadbury has established a factory and settlement intended to rival the English Bournville.

Hobart Pasha, the HON. AUGUSTUS CHARLES HOBART-HAMPDEN, third son of the Earl of Buckinghamshire, was born at Waltham-on-the-Wolds, in Leicestershire, on 1st April 1822, and in the British navy served against the slavers in Brazilian waters, then in the Baltic during the Crimean war. On the outbreak of the Civil War in America, he, as 'Captain Roberts,' took command of a blockade-runner, and several times got through the naval cordon that the North had established along the coasts of the Southern States, his adventures being most exciting and his escapes marvellous. In the service of Turkey (1867) he checked the Greek blockade-runners to Crete, and in 1878 he took command of the Turkish Black Sea fleet. He died on 19th June 1886 at Milan. He wrote

Sketches from My Life (1887) and *Never Caught* (1867).

Hob'bema, MEINDERT, landscape-painter, born in 1638, probably at Amsterdam. Few particulars of his life are known. He is believed to have studied art under Jacob Ruysdael, whose name appears as a witness to his marriage at Amsterdam, 2d October 1668, to Eeltje Vinck, who predeceased him in 1704. He died in poverty, and was buried in the Westerkerkhof, Amsterdam, 14th December 1709. His art usually deals with quiet subjects of Dutch cottage and woodland scenery, and these are treated with a skill which entitles the artist to rank along with Ruysdael at the very head of the landscape-painters of Holland. His works are subdued in tone, and finished with extreme care, yet with a singularly free and spirited touch, and are excellent in composition and lighting. Their figures were executed by Berchem, Adrian Vandevelde, and Lingelbach. Smith has catalogued 142 of his works, which in modern times have commanded very large prices. Seven of his works are in the National Gallery, London, and of these 'The Avenue, Middelharnis, Holland,' is an exquisite example. See E. Michel, *Hobbema et les Paysagistes de son Temps* (1890).

Hobbes, JOHN OLIVER. See CRAIGIE (PEARL MARY TERESA).

Hobbes, THOMAS, was born at Malmesbury on the 5th April 1588, and was the son of the vicar of Charlton and Westport adjoining that town. About the age of fifteen he was entered at Magdalen Hall, Oxford, where he was put through the usual course of Aristotelian logic and physics. His intellectual interests remained entirely unawakened, and long afterwards he attacked the universities in no measured terms for their failure to keep pace with the time. At the age of twenty, having taken his degree and quitted Oxford, he was recommended to Lord Cavendish of Hardwick, afterwards Earl of Devonshire, as tutor to his eldest son. This was the beginning of an intimate connection with that great family, which lasted through his long life. In 1610 he went abroad with his pupil, and made the tour of France and Italy. After his return he still continued to live with the Cavendish family, and his residence in London afforded him opportunities of becoming acquainted with Bacon, Herbert of Cheshire, Ben Jonson, and other distinguished men of the time. The first ambition to awake in him was that of the scholar, and he devoted his abundant leisure to a critical reading of the classical poets and historians. The outcome of these studies was his translation of Thucydides, which appeared in 1628, when he had already reached the mature age of forty. The Civil War was already looming in the distance, and in the choice of subject we may discern Hobbes's strong interest in politics—an interest which ultimately dominated his whole philosophy. The Earl of Devonshire died in 1626, and to Hobbes's great grief the second earl, his pupil, followed his father to the grave in 1628. Next year Hobbes accepted an engagement as travelling tutor to the son of Sir Gervase Clifton, and in this capacity paid a second visit to the Continent; but in 1631 his connection with the Devonshire family was resumed. By the desire of the dowager-countess he undertook the education of the young earl, the son of his former pupil, then only thirteen. From 1634 to 1637 they travelled abroad, and on this occasion Hobbes came into contact with Galileo in Italy, while in Paris he was admitted to the scientific and philosophical circle of which Père Mersenne was the centre.

Since 1629, when chance introduced him to a copy of *Euclid's Elements*, he had been an

ardent student of geometry, and about the same time or a little later he began to be powerfully drawn to the new 'mechanical philosophy' of Galileo. In motion and the laws of motion he seemed to see a universal principle of explanation, and when he returned to England in 1637 it was with the outline of a comprehensive philosophical system already before his mind. Descartes, whose *Discourse on Method* appeared in that year, was also an adherent of the new physics, but limited and supplemented its explanations by the subjective principle of self-consciousness. Hobbes did not occupy himself (except incidentally) with the philosophical question of knowledge, but contented himself with giving an objective explanation of sensation and all mental facts in terms of motion. Regarded as the object of science, the world consisted, in Hobbes's view, of natural bodies (inanimate and animate) and political bodies, or organised aggregates of living men. Natural philosophy and civil philosophy therefore cover the whole ground; but, as the explanation of civil institutions is to be found in the nature of man, man stands out from among all other natural bodies, and forms, as it were, a bridge between nature and society. Accordingly Hobbes planned three systematic treatises, *De Corpore*, *De Homine*, *De Cive*; but the pressure of political events prevented him from publishing his ideas in their natural sequence, and some parts of the scheme are much less fully worked out than others. On his return to England he continued to live with the young Earl of Devonshire, and was on intimate terms with Lord Falkland, Hyde, and others engaged in the political struggles of the time. The need of a political philosophy which would put an end to anarchy by a true theory of the governing power became every day clearer to him, and in 1640 he wrote 'a little treatise in English' in defence of the royal prerogative. This is preserved in MS. under the title of *The Elements of Law, Natural and Politique*, and is identical with the two treatises, *Human Nature* and *De Corpore Politico*, published separately ten years later. Fearful lest the Parliament should take notice of his treatise, Hobbes fled in the same year to Paris, which continued to be his home till 1651.

He was welcomed by his scientific friends, and Mersenne induced him to contribute to Descartes' *Meditations* a series of criticisms thereon. But the political needs of the time still lay nearest his heart, and in 1642 appeared the *De Cive*, a fuller statement of his theory of government. Very few copies of this edition were struck off, and the book appeared with a new title in 1647 as *Elementa Philosophica de Cive*. In 1650 appeared the two treatises already mentioned, and in 1651 he issued a vigorous English translation of the *De Cive* (*Philosophical Rudiments concerning Government and Society*) by way of introduction to the comprehensive English work on which he had been engaged for several years. *Leviathan* was printed in England, and appeared in the summer of 1651. Its rationalistic criticism and its uncompromising reduction of religion to a department of state mortally offended the royalist clergy of the exiled court. Hobbes had been mathematical tutor to Prince Charles in 1647, and the latter always continued to take a friendly interest in his old preceptor; but on the publication of *Leviathan* the author was informed that the young king refused to see him. With constitutional timidity he once more took refuge in flight. He returned to England in the end of 1651, and sent in his submission to the government of the Commonwealth, it being one of the principles with which *Leviathan* concludes that an ordinary citizen has a right to turn to a new power that can give protection, how-

ever little he may approve of the circumstances of its origin. Hobbes settled in London to work out the remaining parts of his scheme. The *De Corpore* appeared in 1655, and the *De Homine*, a rather perfunctory revision of the old *Human Nature* (with expansion on the side of optical theory), in 1658. From 1654 onwards Hobbes was engaged in almost perpetual controversy, first with Bramhall on liberty and necessity, and then with Ward, Wallis, and Boyle in defence of his own hopelessly indefensible mathematical ideas, which involved the quadrature of the circle and similar absurdities. The second controversy dragged over a quarter of a century, Hobbes's last blow being delivered after he had completed his ninetieth year. After the Restoration Charles granted him a pension of £100, and is said to have been always delighted with the old man's wit and repartees, but the bishops and the church party looked with no favour upon the author of *Leviathan*. A series of attacks upon the book began to appear, and it was condemned by the House of Commons in 1666. Three of his later works—*Behemoth*, *The Common Laws*, and a metrical *Historia Ecclesiastica*, all written about 1670—he was obliged to leave unpublished (though *Behemoth* issued surreptitiously from the press just before his death). A collected edition of his Latin works in 1668 had to appear at Amsterdam. At the age of eighty-four Hobbes amused himself by writing an autobiography in Latin verse, and within the next three years he completed a verse translation of the *Iliad* and the *Odyssey*. In 1675 he left London, and the rest of his days were spent at Hardwick and Chatsworth, the two Derbyshire seats of the Devonshire family. He died at Hardwick on the 4th December 1679, in his ninety-second year.

Hobbes stands between Bacon and Locke as the second in order of time of the great English philosophers, but he stands apart from both. It is by his contributions to scientific psychology, to ethics, and to political theory that he takes rank as an original thinker. In the 19th century attention was drawn afresh to his acute psychological analyses by James Mill and the English associationists. His ethical theory, based on pure selfishness on the one hand and the arbitrary prescription of a sovereign power on the other, determined negatively the whole course of ethical speculation in England for a hundred years. Cumberland, Cudworth, and Clarke, and in a somewhat less degree Shaftesbury and Butler, are in the first instance critics and opponents of Hobbes. His political absolutism, however, is the most famous part of his speculations. The state of nature, he argues, is a state of war and insecurity (*homo homini lupus*). Moved by a desire to escape from the intolerable evils of such a condition, human beings enter into a species of contract by which they surrender their individual rights, and constitute a state under an absolute sovereignty. The sovereign power need not be monarchical (though Hobbes's individual preference is for that form of government), but, whatever form it assume, it is absolute and irresponsible. It was far from the intention of Hobbes to justify tyranny, but *Leviathan* was to him like 'a mortal god,' the only guarantee for security and settled government. The theory was substantially adopted by Spinoza; and, stripped of their accidental features, Hobbes's ethico-political ideas had great influence upon the philosophical Radicals of the 19th century. No account of Hobbes would be complete which omitted to mention his admirably clear and trenchant style. A collected edition of his works was published by Sir W. Molesworth in 16 vols. (1839-45). The best account of his life and his place in the history of thought is to be found in Professor Croom

Robertson's *Hobbes* ('Philosophical Classics,' 1886). See also Sir Leslie Stephen's *Hobbes* (1904); Tonnies's *Hobbes* (1896, 1912); G. E. G. Catlin's *Thomas Hobbes as Philosopher, Publicist, and Man of Letters* (1922).

Hobby. See FALCON.

Hobhouse, JOHN CAM, the friend of Byron, was born in 1786, and was educated at Westminster and Trinity College, Cambridge. His *Journey through Albania with Lord Byron* he published in 1813. An advanced Liberal in politics, he stood for Westminster in 1818 without success, but was returned by a large majority in 1820, and sat later for both Nottingham and Harwich. Successively Irish Secretary, First Commissioner of Woods and Forests, and President of the Board of Control, he succeeded to his father's baronetcy in 1831, was created Baron Broughton in 1851, and died without male heirs, 3d June 1869. See his *Recollections*, edited by his daughter (6 vols 1909-12).

Ho'boken, a city in New Jersey, on the west bank of the Hudson River, adjacent to Jersey city, and opposite New York, with which it is connected by ferry and tunnel. It is the terminus of the Delaware, Lackawanna, and Western Railroad, and has a large shipping trade, especially in coal; iron-castings and lead-pencils are among the principal manufactures; and several lines of European steamships start from the port. The Stevens Institute of Technology here is one of the chief schools of its kind in the United States. Pop. (1880) 30,999; (1910) 70,324; (1920) 68,166. The name of this city commemorates in the New World a town to the south-west of Antwerp, with docks; pop. 21,000.

Hobson-Jobson, a term given by English soldiers in India to the Moharram festival; being a corruption of the Shiite cry (see SHIITES), *Ya Hasan! Ya Hosain*. The name was adopted for the Anglo-Indian glossary by Yule and Burnell (1886); and Crooke prepared a new edition in 1903.

Hoccleve, or OCCLEVE, THOMAS (probably so named from the village of Hocclough in Northumberland), an English poet of whom but little is known save that he was born about 1368, was a clerk in the Exchequer, and was writing verse so late as 1448. His chief work is a free, and it must be confessed tedious, version of the *De Regimine Principum* of Egidius Romanus, over five thousand lines in length, and written in Chaucer's seven-line stanza. A prologue, about one-third of the whole in length, begins the work, and here the author tells us a good deal about himself and his troubles. The most interesting passage is that in which he speaks out his grief for the death of his great master Chaucer, the 'foure of eloquence' and 'mirrour of fructuous entendement.' The poem was edited by T. Wright for the Roxburghe Club in 1860. Many other poems are ascribed to Hoccleve, some still unprinted. Some of these are stories from the *Gesta Romanorum*, as that of Jonathas, son of King Darius, and the wicked woman, which was modernised by W. Browne and printed in his *Shepheards Pipe* (1614), where he pays his original a most graceful poetical compliment far beyond his deserts. His *Minor Poems* and his *Complaint* were edited by Dr Furnivall for the Early English Text Society, a supplementary volume (1925) by Sir I. Gollancz.

Hoche, LAZARE, one of the most eminent generals of the French Republic, was born of poor parents, 25th June 1768, at Montreuil, a faubourg of Versailles. Enlisting at sixteen, he rapidly obtained promotion by his courage and capacity, and was given in 1793 the command of the army of the Moselle, for his defence of Dunkirk against the Duke of York. Here he tried to cut

off the communication between the Prussians and Austrians, and, although foiled by the superior forces of the Duke of Brunswick, yet managed to drive the Austrians out of Alsace. His next important service was putting an end to the civil war in La Vendée, which he accomplished with great prudence and moderation. He was appointed to command the troops in the unfortunate expedition for the conquest of Ireland (1796), but the ships were soon scattered by the storms. Soon after he was placed in command of the army of the Sambre and Meuse. On the 18th April 1797 he crossed the Rhine at Neuwied, and had defeated the Austrians in several battles, when his career was stopped by the armistice concluded between the Archduke Charles and Bonaparte at Leoben. After the 18th Fructidor he fell ill at Wetzlar, and died 18th September 1797.

See LIVES by Desprez (1858; new ed. 1880), Dutemple (1879), Font-Réaulx (1890), and Charavary (1898).

Hochelaga. See MONTREAL.

Hochheim, a town of Prussia, in Hesse-Nassau, on the right bank of the Main, 3 miles E. of Mainz. Here is produced the excellent white wine known as *Hochheimer*, whence was derived, before 1825, the English name *Hock*, now applied loosely to almost any white Rhenish wine. Pop. 4000.

Hochkirch, or HOCHKIRCHEN, a village in Saxony, a few miles E. by S. from Bautzen, was the scene of a battle between the Austrians and Prussians (14th October 1758) during the Seven Years' War. Frederick II., with an army 30,000 strong, was attacked under cover of a thick fog by Marshal Daun, with 65,000 Austrians, and compelled to retire to the heights of Drehsa. Frederick lost 9000 men killed and wounded and 101 cannon. He and most of his generals were wounded, and Marshal Keith and Prince Francis of Brunswick were killed. The Austrians lost 6000 men.

Höchst, a town of Hesse-Nassau, on the Main, 6 miles W. of Frankfurt. It is a busy industrial town, and the river trade is considerable. There are dye-works, and manufactures of machinery, porcelain, tobacco, oilcloth, gelatine, furniture, &c. Pop. 28,000. The church of St Justinus dates from the 9th century, and one tower remains of an old palace of the electors of Mainz, to whom the place formerly belonged.

Höchstädt. See BLENHEIM.

Hock. See HOCHHEIM, WINE.

Hockey (probably from O.Fr. *hoquet*, a 'shepherd's crook'), an outdoor game played with sticks or clubs hooked or curved upwards at the striking end, in which two opposing sides seek to drive a ball through the other's goal. In one or other of its variations hockey is probably as old and as widely spread as any ball-game played. By some it has been claimed as the primitive parent of both golf and of cricket. A game of similar nature was familiar to the Greeks and the Romans and to most northern peoples in both Europe and Asia, and hockey as now played must be regarded as a development of the game known in Scotland as 'shinty,' in Ireland as 'hurley,' and in Wales as 'bandy.' In 1527 mention is made of 'the hirlinge of the litill balles with hockie stickes or staves,' but references of the kind are scant, and prior to the middle of the 19th century there is really no documented history of the game. About that time the game was played in schools before football became so popular, and about 1870 there were a considerable number of clubs around London, but fixed rules were lacking, any ball, any stick, and any number of players being seemingly, amongst other things, allowed. In 1875-76 an association was formed to draw up

a fixed code of rules, the rules devised being somewhat similar to those now in use. This association becoming extinct, control was assumed in 1883 by the Wimbledon Club, but few changes were made in the laws of the game. In 1886, however, a second hockey association was established, the formation of that association marking the real beginnings of hockey as now understood, the game in its present form, it will be seen, being English by birth and essentially modern in origin. Since 1886 the spread of the game, which is entirely amateur in character, has been rapid. Apart from England, there are associations in Scotland, Ireland, and Wales, and since 1894 international matches have been played. An international hockey board was formed in 1907, and by it the rules were revised in 1924. In the services, in the universities, and in some of the public schools the game is widely played, while in girls' schools and amongst women generally it has achieved great popularity. The All-England Women's Hockey Association, founded in 1895, is the governing body of the women's game. Outside the British Isles the growth of the sport has been widespread, and there are clubs not only in most of the countries of Europe, but also in North and South America, in South and East Africa, in Egypt, in India, in Australia, in New Zealand, in Japan, and elsewhere. In the country of its origin, hockey is regarded as a winter game.

A hockey ground, marked out in white lines, is rectangular in form, 100 yards long by not more than 60 yards nor less than 55 yards wide, the long sides being known as 'side-lines,' the short sides as 'goal-lines.' Parallel to the side-lines and at 7 yards from them are two lines known as 'seven yards' lines,' while parallel to the goal-lines and at 25 yards from them are two 'twenty-five yards' lines,' 9 yards at the extremities of each alone being drawn. A 'centre-line' joining the middle of each side-line divides the ground into two halves. The goals, formed of two posts 12 feet apart and joined by a horizontal bar 7 feet from the ground, are placed in the centre of each goal-line. Immediately in front of each goal, parallel to and 15 yards from the goal-line, a line 12 feet long is drawn, and by continuing this line each way to meet the goal-line by quarter circles, having the goal-posts opposite each end as centres, a 'striking circle' is formed. The game is played by two teams of eleven players, each side usually consisting of five forwards, three half-backs, two backs, and one goalkeeper. The duration of play, unless otherwise agreed, is seventy minutes, and at 'half-time' the teams change ends. The ball is a cricket-ball painted white, or made of white leather, though, when play is in snow, it may be red. The stick, with a head of ash and a handle of cane, must have a flat striking face on its left-hand side only—no provision thus being made for the naturally left-handed player—must be able to pass through a 2-inch ring, and must not exceed 28 ounces in weight; as to length, there is no regulation. For forwards, a short stick of not more than 22 ounces is considered desirable, while for other players a longer stick, of not more than 25 ounces, is reckoned best. All players being in their own half, the half-backs lying behind the forwards, and the backs and goalkeeper behind the half-backs, the game is started (as after each goal and half-time) by a 'bully' from the middle of the ground. In bullying, each of two players, who face each other, strikes first the ground on his side of the ball and then his opponent's stick above the ball, three times in succession, after which, on either hitting the ball, it is in play. Each side has now two objects in view—first, to score by driving the ball through its opponents' goal, the team

obtaining the greatest number of goals being winners; second, to prevent its opponents from scoring. The first function rests with the forwards, supported by the other players, but especially by the half-backs; the second rests with the goalkeeper and backs, again supported by the other players, but again especially by the half-backs. Speaking generally, play may be of two kinds, individual or combined, and every game is necessarily a mixture of both; in individual play a player attempts by individual skill to trick or circumvent an attacking opponent, while in combined play a player attacked hits or passes the ball to some unmarked member of his side. No goal may be scored unless the ball be hit by an attacker from within the striking circle, a goal also being allowed if the ball, when so hit, passes into goal off the stick or person of a defender. In striking the ball no part of the stick must rise above the level of the shoulder, either at the beginning or at the end of the stroke. Play is allowed only with the flat, left-handed side of the stick, but by reversing the stick so that the end points downwards instead of upwards, a stroke may be made from left to right as well as the normal one from right to left. The ball may not be intentionally hit into the air ('undercut'), though a 'scoop' stroke, provided it is not dangerous, is permissible. The ball may be stopped by any part of the player's body, but must not be held, carried, or otherwise impelled in any direction except by means of the stick, though within the striking circle it may be kicked by the goalkeeper when defending his goal. Charging, kicking, shoving, shinning, tripping, holding or striking at sticks are forbidden, and hooking of sticks is permissible only when the stick hooked is within striking distance of the ball, and then not in the women's game. A player may not obstruct by interposing himself between an opponent and the ball, nor by interposing himself or his stick in any way as an obstruction, nor shall he tackle from an opponent's left, unless he touch the ball before touching the person or stick of his opponent. To prevent any side gaining an unfair scoring advantage by lying behind its opponents' defence, a player, when placed in certain positions with regard to that defence, is ruled 'off-side,' and may not, till the ball be played by one of his opponents, interfere in any way with the game. Penalties for infringement of rules are of three kinds—'free hits,' 'penalty corners,' 'penalty bullies'—varying according to the nature of the offence and to the place where the offence occurred; when a free hit is taken, no player shall be within 5 yards of the striker; a penalty corner is played from any point on the goal-line not less than 10 yards from the nearer goal-post, the ball being struck by an attacker to others of his side ranged round the striking circle, all the defenders remaining meanwhile behind their own goal-line till the ball is struck, when they may rush forward to engage the attackers, who can score only if the ball has been first stopped, or has previously touched a defender or his stick; a penalty bully is played within the striking circle by the offender (unless incapacitated or suspended) and any member of the opposing team, and is really a duel lasting until such time as a goal is scored, or the ball is driven over the goal-line by the attacker or outside the striking circle by either attacker or defender. When in the course of play the ball is played over the side-line, it is rolled back by a member of the opposite side to that driving it over, all other players being meanwhile outside the seven yards' line. Should the attacking side hit the ball over the goal-line, or should the defending side do so unintentionally when outside the twenty-five yards' line, a bully takes place from the twenty-

five yards' line, at a point in a direct line from the spot where the ball crossed the goal-line; should, however, the ball be intentionally driven behind the goal-line by the defending side, from no matter what position, a penalty corner is allowed, while if the ball be unintentionally so driven from within the twenty-five yards' line, a corner is given, the mode of procedure in taking which is the same as that in the case of a penalty corner, except that the ball must be hit from a point on the side or goal line within 3 yards of the nearer corner of the ground. The game is controlled by two umpires, each taking half the ground for the whole period of play without changing ends, while each also gives decisions as to the 'roll in' along the entire length of the side-line. For proficiency in hockey, speed, accuracy in hitting, and the power of immediately adjusting the body to rapid decisions of the mind are the main essentials.

In countries where there is much ice, most notably in Canada and in the United States, hockey played on skates is widely popular. There are various forms of the game, corresponding roughly to each other, and also in general principle to hockey as above described, but differing much in detail. The game on ice is known in England as 'bandy,' the original name of the game, and there is a National Bandy Association. In North America there are games of 'ice-polo' and 'ice-hockey.' The last named was organised in Canada onwards from about 1881, and soon spread to the United States. It is played not with a ball, but with a 'puck,' a piece of vulcanised rubber resembling a draught-stone, 1 inch thick and 3 in diameter. A game of hockey is also played on roller-skates.

See works by F. S. Cresswell (1890), H. F. Battersby (1895), E. Green (1920), H. E. Haslam (1922); also T. H. Shoveller, *Hockey* (1922); E. E. White, *The Complete Hockey Player* (1923); and Heathcote and Trebutt, *Skating, Curling, and Ice Sports* (1892).

Hocktide, or **HOKETIDE**, a popular anniversary which used to be celebrated on the Monday and Tuesday following the second Sunday after Easter. On one day, generally on the Tuesday, the women held the roads and streets, and stopped all men who came their way, and having bound them with cords, only set them at liberty after they had paid a small sum of money. On the other day the men had their turn, and collected from the women. The custom goes back to the 13th century, but became obsolete in the 18th. For a curious survival or reminiscence of the custom still practised at Hungerford, in Berkshire, see *Chambers's Journal*, 18th February 1888, p. 112.

Hodeida, a seaport of Yemen, in Arabia, situated on the Red Sea, whence are exported coffee, hides, cattle, fruits, and mother-of-pearl. Pop. about 40,000.

Hodge, CHARLES, an American theologian, was born in Philadelphia, 28th December 1797. He graduated at Princeton College in 1815, and in 1822 became a professor in the Princeton Theological Seminary, where he remained till the close of his life. He was founder and long the editor of the *Princeton Review*; and besides numerous essays, &c., he was the author of commentaries on Romans, Corinthians, and Ephesians, of a history of the Presbyterian Church in America (1840), and of the well-known *Systematic Theology* (3 vols. 1871-72), now a standard work of the Calvinistic churches. In 1872 he was presented with a sum of \$15,000, and a professorship bearing his name was founded in his honour. He died 19th June 1878. See *Charles Hodge*, by F. L. Patten (1889).—His son, ARCHIBALD ALEXANDER (1823-86), succeeded his father at Princeton in 1878. He wrote *Outlines*

of *Theology* (1860), works on the Atonement and the Confession of Faith, and a Life of his father (1880).

Hodge, JOHN, Labour leader, was born at Muirkirk, Ayrshire, 29th October 1855. Becoming a metal-worker, he interested himself actively in social and economic questions, and, with a view to improving conditions, founded the British Steel-Smelters' Mill, Iron, Tinplate, and Kindred Trades Association, becoming its secretary, and subsequently its president, as also president of the Iron and Steel Trades Confederation. He first entered parliament in 1906, and was strong in the advocacy of conciliation boards in the settlement of industrial disputes. He was chairman of the Labour party from 1915 till 1916, when he joined the Lloyd George coalition ministry, serving first as Minister of Labour, and later as Minister of Pensions (1917-19).

Hodgkin, THOMAS (1831-1913), born of Quaker stock at Nottingham, became a banker in Newcastle, but is known for *Italy and her Invaders* (8 vols. 1880-99), *Lives of Theodorick and Charles the Great*, and a volume on early English history.

Hodgkinson, EATON (1789-1861), a Manchester engineer, became the great authority on iron beams, and was professor of Engineering in University College, London.

Hodgson, BRIAN HOUGHTON (1800-95), orientalist, was born near Macclesfield, entered the East India Company's service in 1818, was Resident in Nepal from 1820 to 1843, and settled in England in 1858. He wrote some 170 very valuable papers on the ethnology, languages, and zoology of Nepal and Tibet, sent home 354 MSS., on which our knowledge of northern Buddhism is mainly based, and made a collection of 10,500 birds. See *Life* by Sir W. Hunter (1896).

Hodgson, RALPH, poet, was born in 1872 in Yorkshire. He lived for a time in the United States, subsequently worked as a journalist in London, and in 1924 became lecturer in poetry at the Tohoku University, Sendai, Japan. *The Last Blackbird* and *Other Lines* appeared in 1907, and *Poems* in 1917. Hodgson's output is small, but his standard high. His work displays a hatred of the dull utilitarianism of men, and an extraordinary sympathy with animals; while in his art, clarity and naturalness and virtuosity are combined.

Hódmezővásárhely, a town of Hungary, 20 miles N.E. of Szegedin. It is an important agricultural and trading centre, the people of the neighbourhood being actively engaged in stock-raising and in the cultivation of the vine, other fruits, and cereals. Pop. 61,000.

Hodograph (Gr. *hodos*, 'a way') of a moving particle is the curve passing through the extremities of those lines which, drawn from a fixed point as origin, represent in direction and magnitude the velocities of the particle at the different points of its path. It is a velocity diagram of a particular kind. Just as the tangent to the path at any point gives the direction of motion of the particle at that point, so the tangent to the hodograph at the corresponding point gives the direction in which the velocity is changing—i.e. the direction of the acceleration. Thus, if the hodograph is a straight line with origin anywhere outside it, we see that the acceleration is constant in direction, for a straight line is its own tangent. Another conclusion at once deducible is that the velocity resolved perpendicular to the direction of the acceleration is always the same, being given by the perpendicular from the origin upon the line. If, in this case, the acceleration is also constant in amount, we obtain the hodograph

of the parabolic motion of a projectile. As another simple case, let the hodograph be a circle, centre the origin. Here the speed of the particle in its path must be constant; and further, the acceleration is perpendicular to the velocity, having the effect of changing the direction only of motion. If, in this case also, the acceleration is given as constant in amount, then the line representing the velocity in direction must rotate uniformly. Hence the path must be such that the angle between the tangents at two points must be proportional to the length of the arc joining them. In technical language, the path must be a plane curve of constant curvature—i.e. either a straight line or a circle, obviously the latter in this case. Thus, under an acceleration constant in amount and always perpendicular to the direction of motion, and to a fixed direction in space, the particle will describe a circle with constant speed, the radius of the circle being a third proportional to the magnitude of the acceleration and the speed. The name hodograph was invented by Sir W. R. Hamilton, who made many elegant applications of its properties to dynamics. In virtue of the aberration of light, every star describes a projection of the hodograph of the earth's motion in its orbit—i.e. the projection of a circle. The properties of the hodograph are treated in all modern treatises on the dynamics or kinematics of a particle.

Hodometer. See PEDOMETER.

Hodson, MAJOR WILLIAM STEPHEN RAIKES, English soldier, usually known as Hodson of Hodson's Horse, was born at Maisemore Court, near Gloucester, on 19th March 1821. Choosing the life of a soldier, he joined the Indian army in 1845, and immediately got his first experience of warfare in the battles of the first Sikh war. In 1847 he was appointed second in command of the Punjab corps of Guides, a body of irregular native troops raised for the protection of the north-west frontiers of India against the marauding hill-tribes. From 1849 to 1852 Hodson was employed in the work of civil government in the Punjab. Then, being made commandant of the Guides corps, he did excellent service on the turbulent frontier. But in 1856 he was deprived of his command on account of irregularities in the regimental accounts and of his unjust treatment of the troops and natives under his authority. In the crisis of the Mutiny, however, he was appointed head of the intelligence department in the army engaged before Delhi, and was commissioned to raise a new regiment of irregular cavalry, which became known as Hodson's Horse. With this body of men Hodson took part in the siege of Delhi and in the subsequent operations down to the siege of Lucknow. After the fall of Delhi Hodson discovered the Mogul sovereign and his sons; these last he shot dead with his own hand at the time of capture. He himself was shot on 11th March 1858, during the assault on a royal palace in Lucknow, and died on the following day. As a leader of irregular native soldiery, Hodson won unqualified praise for his boldness and skill; his wild troopers were warmly attached to him. But he seems to have been of an imperious temper, which sometimes led him to commit acts of violence and injustice. In money matters he was certainly irregular; and he has been accused of 'looting' in war.

See Rev. G. Hodson's *Hodson of Hodson's Horse*; and compare R. Bosworth Smith's *Life of Lord Lawrence*, T. E. E. Holmes's *Four Famous Soldiers* (1889), and the *Life* by Trotter (1901); though none of the four is absolutely satisfactory in his estimate of Hodson's character.

Hoeven, JAN VAN DER, Dutch naturalist, was born on 9th February 1801, at Rotterdam. After

studying medicine at Leyden, and zoology at Paris, he established himself as a physician in his native town; and in 1835 he was elected to the professorship of Zoology at Leyden. He died on 10th March 1868. His most important work is *Handboek der Dierkunde* (1827-33), of which a second edition, entirely recast, appeared in 1846, and an English translation by Clark, with important additions by the author and the editor, in 1856-58. Most of his other works are memoirs.—His brother, CORNELIS PRUYS VAN DER HOEVEN (1792-1871), was professor of Medicine in the university of Leyden (1824-71), and the author of *De Historia Medicinæ* (1842), *De Historia Morborum* (1846), and other important works on pathology and the history of medicine.

Hof, a town of Bavaria, on the Saale, 30 miles NE. of Baireuth, has extensive manufactures of ironwares, cottons, and woollens; cloth has been made here since the 15th century. There is a hospital, founded in 1262. Hof, almost entirely rebuilt since its destruction by fire in 1823, is closely associated with Jean Paul's earlier years. Pop. 40,000.

Hofer, ANDREAS, the patriot leader of the Tyrolese in 1809, was born at St Leonhard, in the valley of Passeier, on 22d November 1767. For a century and a half his forefathers had been landlords of the inn 'Am Sand.' Although little higher in the social scale than a peasant, his force of character was such that, when in 1809 he summoned the people of the Tyrolese valleys to arms to drive out the French and the Bavarians, they responded with alacrity and enthusiasm, eager to show their love for their emperor and the holy church. In seven weeks he twice defeated the Bavarians, twice expelled them from Innsbruck, and finally swept them clean out of the Tyrol. As the armistice concluded between Austria and France after the battle of Wagram left Tyrol and Vorarlberg out in the cold, the French again inundated their valleys with some 40,000 men. But again Hofer in eight days routed the foe and retook Innsbruck. For the next two months Hofer was the actual military governor and civil ruler of his native land. By the peace of Vienna (October 14) the emperor of Austria again left Tyrol and Vorarlberg at the mercy of his enemies. Hofer, after some hesitation as to the wisdom of submission, once more took up arms; but this time the French and Bavarians were too strong for him. They steadily subdued one valley after another; and Hofer, seeing that the struggle was hopeless, disbanded his followers and took refuge in the mountains in the end of November 1809. But two months later his hiding-place was betrayed to the French, and Hofer was captured on 27th January, carried to Mantua, tried by court-martial, and shot on 20th February 1810. The 'Sandwirth' or 'landlord of the Sand' still lives in the memory of his people, and is the hero of many patriotic ballads. His statue, by Schaller, stands in Innsbruck. His native district was given to Italy by the treaty of Saint-Germain (1919).

See Egger, *Geschichte Tirols* (1880); Hirn, *Tirols Erhebung* (1909); and memoirs by Weidinger (1861), Heigel (1874), Stampfer (1874), Schmolze (1900).

Hoff, JACOBUS HENRICUS VAN 'T (1852-1911), an eminent chemist, born at Rotterdam, was successively professor of Chemistry at Utrecht and Amsterdam, and, from 1896, at Berlin. His researches on the 'disposition of the atoms of compounds in space,' the 'osmotic pressure of dissolved substances,' and many other subjects have profoundly influenced modern chemical theory, as well as biology and geology. He received the Nobel (q.v.) prize for chemistry in 1901. He

published *Chemistry in Space* (1891); *Studies in Chemical Dynamics* (1896); *Lectures on Theoretical and Physical Chemistry* (1899); *Zur Bildung der ozeanischen Salzablagerungen* (1905-9).

Hoffmann, AUGUST HEINRICH, commonly called HOFFMANN VON FALLERSLEBEN, poet and philologist, was born 2d April 1798, at Fallersleben, in the district of Lüneburg. At Göttingen and Bonn he occupied himself with philological and literary studies, especially the study of his native language and literature. From 1830 to 1838 he was keeper of the university library of Breslau, and professor of the German Language there from 1835. The publication of his *Unpolitische Lieder* (Unpolitical Lays) in 1842 cost him his professorship. For some years he led a wandering life in Germany, Switzerland, and Italy, until in 1860 he became librarian to the Duke of Ratibor at the castle of Korvei, on the Weser, where he died on 19th January 1874. His principal philological and antiquarian works are *Horæ Belgicæ* (1830-62), *Reineke Vos* (1834), *Geschichte des Deutschen Kirchenlieds* (1832; 3d ed. 1861), collections of ancient German Political (1843) and Social (1844) songs, *Spenden zur Deutschen Literaturgeschichte* (1844), *Die Deutsche Philologie* (1836), and *Findlinge* (1859-60). Hoffmann's own poetry often approaches good *Volkslieder* in its simplicity, tenderness, and playful banter; and for these songs he produced many admirable tunes. His political poetry contributed to the preparation of the political fermentation of 1848. The *Gedichte* appeared in 1834 (8th ed. 1875), and he published numerous collections of songs, as *Allemanische Lieder*, *Soldatenlieder*, *Kinderlieder*, &c. He wrote an autobiography in 6 vols. (*Mein Leben*, 1868-70). See Wagner's *Hoffmann von Fallersleben* (1869-70), and Gottschall, *Portraits*, vol. v. (1876).

Hoffmann, ERNST THEODOR WILHELM, German writer, musical composer and critic, and caricaturist, was born at Königsberg on 24th January 1776. (Later in life, to show his admiration of Mozart, he substituted for Wilhelm the name Amadeus.) Hoffmann qualified himself for a legal career, and in 1796 was appointed assessor in a court at Posen. But his irrepressible love of caricature got him into trouble with his superiors, and he was degraded to an inferior post at Plock. Recovering ground again, for he was all his life long most exemplary in the discharge of his official duties, he was transferred to Warsaw (1804); but the occupation of that city by the French two years later threw him entirely out of office. For the next ten years he led a very precarious existence, being often on the verge of want, yet always painting, composing music, and leading a wild and merry life. His great ideal was to live for and by art, especially music, and in 1808 he was for two months director of the theatre at Bamberg. During these same years he wrote a remarkable essay on Mozart's *Don Juan*, and composed an opera on Fouqué's *Undine*. In 1815 he was enabled to resume his career in the service of Prussia; and from 1816 down to his death in 1822 (25th June) he held a high position in the supreme court at Berlin.

His career as an author did not properly begin until 1814. But his tales cannot be rightly understood without some acquaintance with the strange personality of the writer—a little restless man, with a Roman nose and thin lips, and hawk-eyed, a brilliant talker, full of drollery and wit, vain, wayward, fantastic to an extreme, the child of impulse, and the bond-slave of his wild imagination. Educated on the dreams and ideals of German romanticism at the period of its most exuberant growth, he became himself the arch-

priest of ultra-German romanticism. At Posen, at Warsaw, at Bamberg, and in his last years at Berlin, he was the brilliant centre of the literary and artistic Bohemianism of the place. Amid the riot and revelry at Posen he learned two of the lasting lessons of his lifetime, to wit, that company—amusing company—and much rum were essential to his happiness. A fierce hater of dullness, Hoffmann waged incessant war upon the stiff-necked sticklers for routine and commonplace conventionalism, and upon the dilettanti who dealt so glibly in the phrasemongery of art-criticism. His wit constantly bubbled over in irony, ridicule, sarcasm, and was often both savage and malicious. His imagination was inexhaustible, but utterly undisciplined, wild, and fantastic, yet wonderfully vivid. Apart from music and painting, nothing fettered his interest so keenly as the extravagant and the marvellous, the grotesque, the weird, and the horrible. An impressionist above all things, Hoffmann's literary strength lies in his power of graphic and vivid description: he describes what he actually saw and felt, and he describes, as a painter paints pictures, in the spirit of concrete realism. He used to affirm that he did actually see the imps and hobgoblins and nightmare apparitions which his perverid imagination conjured up before him. In short, Hoffmann's tempest-tossed soul was put in such jeopardy by his uncontrollable imagination, conjoined with his lack of firm principle, that it barely escaped being wrecked upon the rock of insanity.

His shorter tales, upon which his reputation as a writer mainly rests, were mostly published in the collections entitled *Phantasiestücke in Callot's Manier* (1814), *Nachstücke* (1817), and *Die Serapionbrüder* (1819-25). His longer works include *Elixier des Teufels* (1816; Eng. trans. 1824), *Seltene Leiden eines Theaterdirectors* (1818), *Klein Zaches* (1819), and *Lebensansichten des Katers Murr* (2 vols. 1821-22), this last being partly autobiographical. Of his fairy tales *Der Goldene Topf* was translated by Carlyle (1827). Hoffmann's *Ausgewählte Schriften* appeared in 15 vols. in 1827-39, the most complete edition of his *Gesammelte Schriften* in 15 vols. (Grisebach's) in 1900. Most of his notable tales have been translated into English. His writings, and translations and imitations of them, have been very popular in France. See Hitzig, *Hoffmann's Leben* (1823); books on him by Ellinger (1894), Klinke (1903), and Schaukal (1922); Funck's *Erinnerungen* (1836); and Carlyle's *Miscellaneous Essays*, vol. i. Offenbach's opera, *Les Contes d'Hoffmann*, was produced in 1881.

Hoffmann, FRIEDRICH, a German physician, was born at Halle, 19th February 1660, and died in that city, 12th November 1742. On the conclusion of his studies at Jena and Erfurt he commenced practice at Minden in Westphalia in 1685, but three years later removed to Halberstadt. In 1693 he was appointed to the professorship of Medicine in the newly-constituted university of Halle. He gained a European reputation as a practitioner, and was body physician to Frederick I. of Prussia. His medical theories are now for the most part antiquated, though some of his pharmaceutical preparations, once highly esteemed, are still in use. The most important of his works, *Medicina Rationalis Systematica* (9 vols. 4to), was published in 1718-40. His *Opera Omnia* were printed at Geneva in 1740, in six folio volumes, with three supplementary volumes in 1753-60.

Hoffmann, or **HOFFMANN-DONNER, HEINRICH** (1809-1894), German physician and writer of children's books, was born at Frankfurt-on-the-Main, studied at the universities of Heidelberg, Halle, and Paris, and subsequently taught and practised medicine. He wrote on medical subjects, but is best known by his children's books, which he illus-

trated himself; *Struwwelpeter* (1845), which has gone through many editions in many languages, is the most famous.

Hofhaf, one of the chief towns of the Arabian district of El-Hasa, situated a short distance inland, over against the islands of Bahrein in the Persian Gulf. It has a fortress, believed to have been built by the Karmathian princes. Held by Turkey from 1872, it was taken by the Emir of Nejd in 1914. Its mosque is famous for its beauty. The inhabitants excel in brass, gold, silver, and leather work. Pop. 30,000.

Hofmann, AUGUST WILHELM VON, chemist, was born at Giessen, 8th April 1818. After obtaining the degree of doctor of philosophy, he became assistant to Liebig in the laboratory at Giessen. When the Royal College of Chemistry was established in London in 1845 Hofmann was, on Liebig's recommendation, made superintendent of the new institution; and from 1856 to 1865 he was chemist to the royal mint. In 1865 he went to Berlin as professor of Chemistry. His contributions to the scientific journals here and in Germany are mainly on organic chemistry. It was in the course of these researches that from coal-products he obtained aniline (see *ANILINE, DYEING*). He devoted much time and labour to the development of the theory of chemical types. His *Introduction to Modern Chemistry* (1865) led to great reforms in the teaching of chemistry. He wrote on *The Life-work of Liebig* (1876), and, in German, on the work of the chemists Wöhler (1883) and Dumas (1885), as also *Chemische Erinnerungen* (1882). Ennobled in 1888, he died 5th May 1892.

Hofmann, JOHANN CHRISTIAN KARL, theologian, was born at Nürnberg, 21st December 1810, studied at Erlangen and Berlin, and having been *docent* and extra-ordinary professor of Theology at Erlangen, was called as professor to Rostock, whence, in 1845, he returned to Erlangen. He was ennobled in 1857, and died 20th December 1877. In his numerous works he maintained an unswerving Lutheranism, the chief being the work on prophecy (*Weissagung und Erfüllung*, 1841-44) and the defence of Christianity from its records, *Der Schriftbeweis* (1852-56; 2d ed. 1857-60).

Hofmannsthal, HUGO VON, Austrian poet and dramatist, was born at Vienna, 1st February 1874. Reared in an atmosphere of culture, he travelled considerably, and eventually settled at Rodaun, a suburb of his native city. At seventeen he wrote *Gestern*, and at eighteen *Tod des Tizian*, two short plays which caused him to be hailed by many critics as technically the greatest writer in German since Goethe. Later work in drama consisted of further short plays after the manner of his first, *Tor und Tod*, *Der Weisse Fächer*, *Die Frau im Fenster* being best; longer plays on original themes, as *Die Hochzeit der Sobeide*; and longer plays modelled round themes of earlier dramatic masterpieces, as *Elektra*, his best-known play, *Ödipus und die Sphinx*, *König Oedipus*, *Das Gerettete Venedig*, and *Jedermann*, a play based on a free handling of the old morality *Everyman*. It is essentially in the last kind that Hofmannsthal has achieved most conspicuous success, his method being to arrange at will the scenes of old plays, and completely to recreate the characters from the standpoint of a later day. *Christianas Heimreise* and *Der Rosenkavalier* are successful comedies. As a lyric poet Hofmannsthal has also attained much distinction. His *Gesammelte Gedichte* appeared in 1910. Two volumes of *Prosaische Schriften* consist of studies in literature, religion, and character. Hofmannsthal represents a reaction from the unmitigated realism of contemporary literature in German, and as an artist he is unusually detached from everyday existence. His is a

genius of oppressive melancholy, but he is always a master of style, and an extreme lover of rich beauty. Some of his work has been translated into English, mostly in the United States. He is well known to theatre-goers from Strauss's operas (*Elektra*, *Rosenkavalier*, *Die Frau ohne Schatten*).

Hofmeyr, JAN HENDRIK, South African politician, was born of Dutch parents at Cape Town, 4th July 1845. Educated at the South African College, he entered journalism, and in his paper, *Ons Land*, gave expression and organisation to the nationalism of the South African Dutch. In 1878 he founded the Farmers' Association, which in 1883 was merged in the Afrikaner-Bond (see **AFRICANDER**), which he controlled, and from 1879 to 1895 sat in the Cape parliament as leader of the Dutch party. Hofmeyr's nationalism, however, seeking ultimately, as it did, to embrace the whole white population of South Africa, did not involve him in conflict with British rule. Thus he represented his colony at various intercolonial conferences, anticipated Joseph Chamberlain in his advocacy of imperial union by way of imperial preference, helped largely to negotiate the Swaziland convention with the Transvaal in 1890, was for long a close ally of Cecil Rhodes, and in the period preceding the South African War was active on the side of peace. During the war he was absent from the country, but returned later to regain his influence. To the subsequent movement for South African union, however, he gave only qualified support. He died in London, 26th October 1909. See *Life* by J. H. Hofmeyr (1914).

Hofuf. See **HOFHUF**.

Hog. See **BOAR (WILD)**, **FIG**. In Scotland a sheep that has not yet lost its first fleece is called a Hog or Hogg; a sheep two years old is a Hogget.

Hogarth, DAVID GEORGE, archaeologist and explorer, was born at Barton-upon-Humber, 23d May 1862, and educated at Winchester and at Magdalen College, Oxford. He has explored, among other countries, Asia Minor and Syria, and made notable excavations there, as well as in Egypt, Cyprus, and Greece. He was director of the British School at Athens, 1897-1900, and in 1909 was appointed keeper of the Ashmolean Museum, Oxford. During the Great War he served on the intelligence staff in Egypt and the Near East, and in 1922 became official historian of the Royal Air Force. He is the author of numerous works, mostly archaeological and topographical.

Hogarth, WILLIAM, a celebrated painter, engraver, and pictorial satirist, born in Bartholomew Close, London, on the 10th November 1697, served his apprenticeship to a silversmith named Ellis Gamble, in Cranbourne Alley, Leicester Fields, and studied art at Sir James Thornhill's school in James Street, Covent Garden. About 1720 he set up for himself. His first employment was to engrave coats of arms, crests, shop-bills, &c., after which he began to design plates for the booksellers, the chief of which are the illustrations to Gray's edition of *Hudibras* (1726). He next tried his hand at portrait-painting, and soon had ample employment for what are called 'conversation pieces,' but he never cared greatly for this branch of art. In March 1729 he married clandestinely the daughter of Sir James Thornhill, and shortly afterwards began to display his extraordinary faculty for depicting the vices and follies of his time. In 1730-31 he painted 'A Harlot's Progress,' a series of six pictures which, like many of his other works, was engraved by himself. It was published in April 1732. The 'Harlot's Progress' was followed by other moral histories and satiric delineations, such as 'A Midnight Modern Conversation' (1734), 'Southwark Fair' (1735), 'A Rake's Progress' (1735), 'The Distressed Poet'

(1736), 'The Four Times of the Day,' and the 'Strolling Actresses dressing in a Barn' (1738). Concurrently with these Hogarth made more than one attempt to compete with the popular history-painters of his day, and with far less success produced the large canvases still in St Bartholomew's Hospital—the 'Pool of Bethesda' and the 'Good Samaritan,' both executed in 1736; and he also produced several portraits. The series of graphic satires was, however, continued by the 'Enraged Musician' (1741) and the famous 'Marriage à la Mode' (his masterpiece), six pictures now in the National Gallery, and engraved by various hands in 1745. 'Industry and Idleness,' twelve plates, followed these in 1747; 'Calais Gate, or O the Roast Beef of Old England!' (1749) came next, and in 1750 the fine plate known familiarly as the 'March to Finchley.' The minor plates of 'Beer Street' and 'Gin Lane' and the set called 'The Progress of Cruelty' belong to 1751. In 1752 he published the *Analysis of Beauty*, a treatise containing many shrewd remarks, but confused and illiterate in its style. It had only a *succès d'estime*. After this he returned to his graver, producing (with the aid of Grignion and others) the four prints of the 'Election Series' (1755-58), the 'Cockpit' (1759), and other pieces. In 1757 he was appointed sergeant-painter to the king. In 1762-63 an unhappy excursion into politics involved him in a miserable quarrel with Wilkes and Churchill, the result of which, on his side, was the well-known portraits of Wilkes, and of Churchill as a bear ('The Bruiser'). By this time his health was failing. He composed a tail-piece to his works, 'Finis, or the Bathos,' March 1764; and in October of the same year died at his house in Leicester Fields. He was buried in Chiswick churchyard, under an epitaph by Garrick. Not far off still stands the little villa which he long occupied as a summer residence.

There are portraits of Hogarth by himself in the National and National Portrait Galleries, and most of his pictures, which now enjoy a much higher repute for technique than formerly, are preserved in public or private collections in Britain. His powers of invention and combination were extraordinary; and as a humorist and social satirist with the pencil he has never been surpassed. There can be no doubt also that he genuinely desired to assist by his work in the reformation of manners.

His prints can be studied in the collections of Boydell (1790), or of Baldwin and Cradock (1820-22). Biographical studies of him have been published by G. A. Sala (1866) and by Austin Dobson (new ed. 1907). Commentaries on his engravings are to be found in John Ireland's *Hogarth Illustrated* (1791-98); Lichtenberg's *Ausführliche Erklärung* (revised edition, 1850-53); Nichols and Steevens' *Genuine Works* (1808-17); and F. G. Stephens' *Catalogue of the Satirical Prints and Drawings in the British Museum*, vols. ii.-iv.

Hogg, JAMES, Scottish poet, was born, in a cottage near the parish church of Ettrick, Selkirkshire, in the year 1770. The exact date of his birth is unknown; and rather singularly he himself asserted it to have been the 25th January 1772. It is beyond question, however, that he was baptised on 9th December 1770. He was the second son of Robert Hogg, farmer and shepherd, by Margaret Laidlaw, who was a distant relative of William or 'Willie' Laidlaw, the amanuensis of Sir Walter Scott and author of 'Lucy's Flitting.' Hogg's education was conducted in a very irregular fashion, owing to his being taken from school at intervals to help his father in tending sheep. His schooling—according to his own statement—amounted in all to about six months; he learned to read the Bible, but not to write. Meanwhile, however, his mother had filled his imagination by telling him 'tales of kings, giants, knights, fairies, kelpies, brownies, &c.' In the intervals

of work he seems to have educated himself, and when he was about sixteen years of age a perusal of *The Gentle Shepherd* and *Life and Adventures of Sir William Wallace* kindled his poetical fancy. Hogg himself says, however, that it was not till 1796 that he attempted to write verses, and 'for several years his compositions consisted wholly of songs and ballads, made up for the lasses to sing in chorus.' In 1800 one of his poems, 'Donald M'Donald,' having for its subject the threatened invasion of Great Britain by the first Napoleon, was published anonymously. The following year, having visited Edinburgh to sell his employer's sheep, he had printed in pamphlet form *Scottish Pastorals, Poems, Songs, &c.* Of this small volume a thousand copies were thrown off, but no impression was made upon the public by it. At this time Hogg contemplated emigration to the island of Harris, and wrote a 'Farewell to Ettrick.' His scheme fell through, but he was fortunate enough to make the acquaintance of Sir Walter Scott—then Mr Scott, sheriff of Selkirkshire. Having written out several ballads from his mother's recitation, he sent them to Scott, who gave them a place in the third volume of his *Border Minstrelsy*, which appeared in 1803. The same year Constable, acting on Scott's advice, published a volume of verse entitled *The Mountain Bard*, and also a treatise of a different kind entitled *Hogg on Sheep*. The two between them brought him £300, which he sunk in a farm that proved a total failure. After several years of vicissitude, in which he tried, without success, to run large stock farms, Hogg repaired to Edinburgh and entered definitely on a literary career. He published in 1810 a second volume of poems, *The Forest Minstrel*, which proved a failure, and started a weekly paper, *The Spy*, which lasted for a few months. Meanwhile he seems to have gone into business as a land-agent, but here again to have met with no success. In 1813, however, he published his greatest work, *The Queen's Wake*, and at once obtained cordial recognition from the critics, Jeffrey declaring in the *Edinburgh Review* that 'no doubt can be entertained that he is a poet in the highest acceptance of the term.' Hogg had made the friendship of Harriet, Duchess of Buccleuch, and in accordance with her death-bed request her husband granted him, on the payment of a nominal rent, one of his farms known indifferently as Mossend, Eltrive Lake, or Altrive. Had he given himself up to this farm and to literature Hogg would probably have been a well-to-do as well as a happy man. But he hampered himself by taking the neighbouring farm of Mount Benger, and was more or less in pecuniary difficulties to the end of his days. He was very happy, however, in his domestic life. In 1820 he married Margaret Phillips, the daughter of a tenant-farmer in Annandale, whom he had met at the house of her brother-in-law, Mr Gray, one of the teachers in the High School of Edinburgh. She proved an admirable wife, although she was some twenty years younger than her husband. Hogg now produced in rapid succession a number of works both in verse and prose. Of the former the chief are *Mador of the Moor*, *The Pilgrims of the Sun*, *Queen Hynde*, and the *Border Garland*; of the latter *The Brownie of Bodsbeck*, *Winter Evening Tales*, *The Three Perils of Man*, and *The Three Perils of Woman*. It seems doubtful whether he was the sole author, or along with Lockhart the joint-author, of the remarkable *Confessions of a Justified Sinner*, otherwise known as *The Private Memoirs and Confessions of a Fanatic*, published in his name. Hogg was at this time a well-known figure in Edinburgh society; was the intimate

friend of Professor Wilson, Sir Walter Scott, and Lockhart, although he had his differences with all three; wrote considerably for *Blackwood's Magazine*, and was the basis of the famous 'Shepherd' of the *Notes Ambrosianæ*. In the end of 1831 he paid a visit to London to arrange for the publication of a complete edition of his works. He remained for some weeks in the metropolis; was entertained to dinner by the Highland Society of London, and in other ways lionised. He died at Altrive, November 21, 1835.

Hogg once described himself to Scott as 'the king of the Mountain and Fairy School' of poetry, and this definition, egotistic though it is, holds good so far as Scotland is concerned. Of his masterpiece, 'Kilmeny,' a leading critic of to-day, Professor Saintsbury, has said that it is 'such poetry as, to take Hogg's contemporaries only, there is none in Rogers or Crabbe, little, I fear, in Southey, and not much in Moore.' Some of his ballads, such as 'The Witch of Fife,' and a few of his songs, especially 'When the Kye Comes Hame,' belong to the immortal part of Scottish if not of English literature. The late Professor Ferrier's description of Hogg as 'after Burns (*proximus sed longo intervallo*) the greatest poet that had ever sprung from the bosom of the common people' is now the universally accepted verdict of criticism. Hogg's prose is much more unequal than his poetry; a strong though coarsish humour is its most notable characteristic.

The chief authorities on the life of Hogg are his autobiography and *Memorials of James Hogg, the Ettrick Shepherd*, edited by his daughter, Mrs Garden (1885). Professor Wilson prefixed a short Memoir to an edition of his works; another edition in two large volumes, by T. Thomson, appeared in 1865, and a selection by Dr W. Wallace in 1903. See the Life of Hogg by Sir George Douglas (1899), the same author's *The Blackwood Group* (1897), and Mrs Oliphant's *William Blackwood and his Sons* (1897), and the Life by H. T. Stephenson (Bloomington, Ind., 1922). A notable criticism of Hogg is Professor Saintsbury's in his *Essays in English Literature* (1890).

Hogmanay, a name applied in Scotland to the last day of the year, often celebrated with holiday festivities in connection with New-year's Day. The word has been connected with the French *aguillaneuf* (as in Rabelais), explained by Cotgrave as *au gny l'an neuf* ('to the mistletoe the new year')—an exploded ingenuity; really a Latin refrain, *hoc in anno*, corrupted in Normandy to *hoguinan* or *hoguinan*; *hogu* next becoming *agu* and *aguill*, and *anno* being first interpreted and then spelt as *an neuf*: see *Notes and Queries*, December 1912, p. 506.

Hog-nut. See COB-NUT.

Hog Plum, a name given in the West Indies to the fruit of certain species of Spondias, trees and shrubs of the natural order Anacardiaceæ, also called Spanish Plum and Brazilian Plum. *S. purpurea* and *S. lutea* are the species generally called Hog Plum in the West Indies, because their fruits are a common food of hogs, which revel in their abundance. A much-esteemed Brazilian dish is prepared of milk, curds, sugar, and the pulp of the fruit of *S. tuberosa*, from which also a refreshing beverage is made for use in fevers.

Hog-rat, or HUTIA (*Capromys*), a genus of rodents, represented by four species restricted to Jamaica and Cuba. They are nocturnal or crepuscular animals, almost entirely vegetarian, climbing trees and sheltering in the thick underwood. The tail of *C. prehensilis* has some prehensile power; in *C. melanurus*, an animal about the size of a rabbit, the stomach is remarkable in being divided by two constrictions into three compartments. The natives sometimes use hog-rats for food.

Hogshead, an old English measure of capacity, no longer in use, but equivalent for wine to 63 gallons, for ale and beer to 51 gallons. In the United States the word now signifies a large cask.

Hogue, CAPE LA. See LA HOGUE.

Hohenlinden, a village of Upper Bavaria, 20 miles E. of Munich, famous for the victory of 70,000 French under Moreau over 60,000 Austrians under the Archduke John, 3d December 1800. Moreau's army took up a position on the plateau between the Isar and the Inn, and the Austrians on the right bank of the Inn. The Austrian main body advanced amidst drifting snow, and attacked the divisions of Grénier and Grouchy with the utmost fury; but, the French receiving considerable reinforcements under Ney, the assailants were driven back, and, being attacked in the rear, were totally routed. The victory was likewise decided at other points in favour of the French, who were only prevented from pursuit by inclement weather, bad roads, and the short winter day. The Austrians and their Bavarian allies lost 17,000 men and 74 guns; the French had 5000 killed and wounded. Campbell's immortal lyric will keep the details of this battle from ever being forgotten. See Furse, *Marengo and Hohenlinden* (1903).

Hohenlohe, a former German principality in Franconia, now comprised chiefly in Württemberg, partly also in Bavaria.

Hohensalza. See INOWRACZAW.

Hohenschwangau, a castle in Bavaria, 55 miles SW. of Munich, near the right bank of the Lech, and the southern frontier of the kingdom. It stands in a beautiful and romantic district, 2933 feet above sea-level. It was purchased in 1832 by the crown-prince Maximilian of Bavaria, who restored it in the style of a magnificent medieval feudal castle. The interior contains several superb halls decorated with frescoes and wall-paintings by eminent German artists. A castle called Schwanstein occupied the same site as early as the 12th century; a second was erected in 1538-47; and the existing building is the third castle. On another crag over against Hohenschwangau stands the castle of Neuschwanstein, which was built in 1869-71 on the site of the castle originally called Hohenschwangau by King Louis of Bavaria, in the Early Romanesque style. This castle too, a most magnificent and 'romantic' structure, contains superb wall-paintings, and displays the utmost splendour in its internal fittings. It was in his later years the favourite residence of the unhappy Louis II., who spent large sums in further adorning it.

Hohenstaufen, a German princely house, members of which held the imperial throne from 1138 to 1254. The founder of the family was **FREDERICK VON BUREN**, who lived about the middle of the 11th century. His son Frederick assumed the name of Hohenstaufen from a castle which he built on the hill of Staufen (2240 feet), 25 miles E. of Stuttgart. He was invested with the duchy of Swabia by the Emperor Henry IV., and during the absence of the latter in Italy acted as vicegerent of the empire. Frederick, at his death in 1105, left two sons—**FREDERICK II.** the One-eyed, and Conrad. The former was confirmed in the duchy of Swabia; and in 1112 the latter received the duchy of Franconia. After the death of Henry V. this emperor's family estates fell to the House of Hohenstaufen; and Lothaire of Saxony was elected his successor in the empire. Lothaire revoked the grants made to the Hohenstaufens, and thus gave rise to a furious war, in which Frederick (his brother Conrad being absent in the Holy Land) had to encounter, single-handed, the whole power of the emperor, the House of Zährin-

gen, and Henry the Proud, Duke of Bavaria and Saxony. After Conrad's return fortune at first seemed to favour the brothers, but in 1135 they were compelled to submit and plead for the emperor's forgiveness. They were then put in possession of all their estates. Conrad, in 1138, was elected emperor of Germany as Conrad III. The succeeding emperors of this family were Frederick I. (1152-90), Henry VI. (1190-97), Philip I. (1198-1208), Frederick II. (1212-50), and Conrad IV. (1250-54). Manfred, half-brother of the last named, lost his life in the battle of Benevento (1266), whilst asserting his rights to the throne of the Two Sicilies; and Conradin, son of Conrad IV., was put to death (1268) by Charles of Anjou for carrying on the struggle. See Raumer, *Geschichte der Hohenstaufen* (5th ed. 1878); GERMANY; and the articles on the several emperors.

Hohenstein, a Saxon town, with textile industries, 12 miles NE. of Zwickau; pop. 15,000.

Hohenzollern, a south German province of Prussia, formerly two united principalities (Hechingen and Sigmaringen), consists of a narrow strip of land entirely surrounded by Württemberg and Baden; area, 441 sq. m.; population, 71,000, mostly Roman Catholics. The territory, whose surface is generally mountainous, stretches south-east from the Black Forest, across the Neckar and the Danube. The principal industries are agriculture and the rearing of cattle. Iron ore, gypsum, salt, and coal exist, as well as some mineral springs. The seat of government is Sigmaringen.

The Hohenzollern family traces its descent from Count Thassilo, who lived about the beginning of the 9th century, and founded a castle near Hechingen, on the Zollern hill in the Swabian Alb, whence his descendants derived their patronymic. About 1165 the first separation took place, Frederick IV. founding the elder or Swabian and Conrad III. the younger or Franconian line. The elder line was subdivided, in 1576, into the branches of Hechingen and Sigmaringen. Frederick VI., the representative of the younger line, in 1415 received from the Emperor Sigismund the investiture of the electorate of Brandenburg, thus founding the dynasty of kings of Prussia and German emperors that reigned till the revolution of November 1918. The two branches of the elder line continued unbroken till 1849, when the reigning princes ceded their respective rights and principalities to the king of Prussia, who agreed to pay them annual pensions. See GERMANY.

Hoist. See LIFTS.

Hokitika, a town of Westland, New Zealand, on the west coast, has timber and flax industries, and is the chief centre of a gold-producing and agricultural district.

Hokkaido, the Japanese name for the northern division of the empire, including Yezo, the Kuriles, and other adjacent islets.

Hokoto Islands. See FORMOSA.

Hokusai, a Japanese artist, born at Tokyo in 1760. He studied in Shunsho's studio, but was obliged to leave because of his experiments in the classical Kano manner, and he became the representative of the *Ukiyo-ye* or popular school. In the West he is generally recognised as one of the greatest artists of the world, worthy of ranking with Rembrandt, Dürer, and the greatest masters of the ages. His knowledge of technique and his excellence as a draughtsman were both amazing, and are shown to advantage in his 'River Bridge,' from which the influence he exercised over Whistler in design is obvious. His 'Thirty-six Views of Fujiyama' display him as a master of colour, where

his combinations of blues, greens, and yellows were striking innovations; indeed, he carried this farther in 'Views of the Loochoo Islands,' where his blending of bright reds, blues, and browns is as amazing as the exquisite delicacy and beauty of his colours in others of his works. He illustrated the famous *Mangwei*, where almost the entire life of Japan is shown. His output was enormous, and includes *Toto Shokei Ichiran* (1800), *Hokusai Shashin Gwaqu* (1814), and the *Yama Mata Yama*. Hokusai lived in great poverty all his life. He died at an advanced age in May 1849, saying at the last, 'If Heaven had but lent me five years more I should have become a great artist.' See JAPAN.

See M. Revon, *Études sur Hokusai* (1896); E. F. Fenollosa, *Catalogue of the Exhibition of Paintings by Hokusai at Tokyo* (1900), and *Epochs of Chinese and Japanese Art* (1922); Capt. F. Brinkley, *The Art of Japan* (1902); E. F. Strange, *Hokusai* (1906); Louise Norton Brown, *Block Printing and Book Illustration in Japan* (1924).

Holacanthus, a genus of fishes, in characters and distribution similar to the Chaetodonts (q.v.). They are remarkable for the great beauty and symmetry of their colours, and for their excellence as articles of food. The body is compressed, and the gill-cover bears a strong spine. One of the best known of the forty species, called *Emperor of Japan* by the Dutch, is *H. imperator*, one of the most esteemed fishes of the East Indies, rivaling the salmon in flavour. Its greatest size is about 15 inches long; its colour is deep blue, with numerous narrow bands of orange, the pectoral fins black, the tail bright yellow. In beauty it is rivalled by an allied species, *H. diacanthus*, of similar distribution.

Holbach, PAUL HEINRICH DIETRICH, BARON D', philosopher, and one of the French encyclopædists of the 18th century, was born of wealthy parentage, at Heidelberg, in the Palatinate, in 1723. At an early age he went to Paris, where he continued to reside during the remainder of his life. He died 21st June 1789. As Holbach was remarkable for his agreeable social qualities, and kept a good table, the most eminent thinkers and writers of the day, such as Condorcet, Diderot, Duclos, Helvétius, Raynal, Rousseau, Buffon, &c., were in the habit of assembling at his house. The witty Abbé Galiani called Holbach the *maître d'hôtel* of philosophy. Here speculation, it is said, was carried to such daring lengths that Buffon, D'Alembert, and Rousseau were compelled to withdraw from the circle. Holbach was the zealous champion of naturalism, and contended not only against Christianity, but against every positive religion. His principal work is the *Système de la Nature* (2 vols. 1770). In it the author endeavours to expound the natural principles of morality, and to investigate the origin of the conflicting opinions on virtue and vice. He discusses the maxims of religious morality, and takes a rapid survey of social and savage life. He touches on the so-called 'social compact,' and in the course of his observations tries to prove, among other things, that self-interest is the ruling motive of man, and that God is only an ideal being, created by kings and priests. The materialism of the French *philosophes* of the 18th century is nowhere more pernicious and paltry than in the writings of Holbach. It is but fair to state that his life was better than his books. He was a man of good heart, and, in spite of his theories, of most unselfish benevolence. When the Jesuits fell into disgrace during the reign of Louis XV., Holbach, though he hated their system, and had written against them in the days of their prosperity, made his house an asylum for his old

foes when the clouds gathered round them. See Lord Morley's *Diderot and the Encyclopædists* (1878).

Holbeach, a market-town of south Lincolnshire, $7\frac{1}{2}$ miles by rail ENE. of Spalding. It has a fine Decorated church, with a spire 189 feet high; and Roman remains have been found here. Pop. 5000.

Holbein, HANS, the younger, one of the most celebrated of painters, was born at Augsburg in 1494 or (more likely) 1495, the son of Hans Holbein the elder (c. 1460-1524), also a painter, and known by such works as 'The Basilica of St Paul,' now in the Augsburg Gallery. He was instructed in art by his father, and his earlier efforts were influenced by the works of Hans Burgkmair, who, according to such authorities as Stettin, was his maternal uncle. The first paintings that can with certainty be attributed to Holbein's hand are two panels of an altarpiece in the above-named collection. Various Madonna pictures which bear traces of the influence of the school of Memling, and a votive work in memory of Burgomaster Ulrich Schwartz, were painted in the immediately following years; but the finest of the artist's productions executed in Augsburg was the altarpiece for the monastery of St Catharine (1515-16), now in the Pinakothek, Munich, Renaissance architectural ornamentation of great beauty being skilfully introduced.

About 1516 Holbein was at work in Basel, but he does not appear to have settled there till 1520, when he received the freedom of the city, and became a member of the guild *Zum Himmel*, which his elder brother Ambrosius, also a painter, had joined three years previously. During the interval he was painting in Zurich, and in Lucerne—where he decorated the interior and exterior of the residence of the mayor, Jacob von Hertenstein, with paintings now only known through drawings which were executed before the building was destroyed in 1824. It is possible that he also during this period made a brief visit to Milan; and the influence of the masters of northern Italy, especially of Mantegna and Leonardo da Vinci, can be traced in his subsequent productions. Among the more important works executed at Basel are the powerful portraits of the Burgomaster Jacob Meier and his wife; while the religious subjects of the period include eight scenes of the Passion, painted upon a panel, ranked very highly by Woltmann, though Rumohr and Wornum are unable to regard them as Holbein's work, and the doors of the organ of Basel Cathedral, painted upon canvas, with stately figures of saints and bishops. All these works are now in the Basel Museum. To 1522 is due one of the most important of the master's religious pictures, the Madonna and Child with St Ursus and St Martin of Tours (or perhaps St Nicholas), painted for the church of Reuchen, near Solothurn; and to about the same date is assigned the great work commissioned by that Jacob Meier whom Holbein had already painted, and representing the merchant with his wife and family kneeling before the Virgin and Child. The picture exists in two slightly-varying versions at Darmstadt and at Dresden, of which the former is the finer, and is now generally admitted to be the original. His mural decorations of 'The Peasants' Dance' and various classical subjects on the façades of a house in the Eisengasse, and those in the town-hall, are now known only through sketches and a few surviving fragments. He also executed noble portraits of Bonifacius Amerbach, professor at Basel, in the museum there; of Frobenius, the printer; and two distinct portraits of Erasmus and one of Melancthon. Another interesting memorial of the intercourse between Erasmus and Holbein is a copy of the 'Praise of

Folly,' published by Frobenius in 1514, in which the margins are enriched by a series of vigorous and humorous pen-sketches by Holbein. It is now in the Basel Museum.

During his residence at Basel Holbein was largely employed upon designs for the wood-engravers, probably indeed it was mainly with a view to such work that he settled there. In addition to about twenty alphabets of richly ornamental letters, he designed over 300 woodcuts, including printers' devices, title-borders, and such general illustrations as those to Adam Petri's editions of Luther's New Testament (1522 and 1523), to Thomas Wolff's issue of the same work (1523), and to Petri's edition of Luther's Old Testament (1523); as also the large single woodcuts of 'Christ bearing the Cross' and 'The Resurrection,' and the two scarce subjects of 'The Sale of Indulgences' and 'The True Light,' which, like some other of his works, show the artist's warm sympathy with the Reformation. His most important woodcuts, however—the noble series of 'The Dance of Death' and the 'Old Testament Cuts'—though probably executed at this time, were not issued till a later period, the first editions of both being published at Lyons in 1538. It was formerly believed that Holbein was engraver as well as designer of the woodcuts associated with his name, but it is now generally conceded that he only designed and drew them.

In the end of 1526 or the beginning of 1527 Holbein visited England, when he was introduced by Erasmus to Sir Thomas More, then in high favour with Henry VIII. He now began his great series of portraits of the most eminent Englishmen of his time, the studies for many of which exist in the cabinet of eighty-seven masterly drawings by his hand in the royal collection at Windsor. In various ways these drawings throw valuable light upon his methods of work; the fact, for instance, that many of them bear written notes of the colours of their details proves that he was accustomed to execute his finished oil portraits from such charcoal and chalk sketches as these, and not directly from the life. Excellent autotype reproductions of these drawings have been issued by the South Kensington Department. Among the most notable of his oil portraits executed in England are 'Archbishop Warham,' of which versions exist at Lambeth Palace, in the Louvre, and in the possession of Viscount Dillon; 'Sir Henry Guildford,' in the royal collection at Windsor; 'Nicholas Kratzer,' the king's astronomer, in the Louvre; and 'The Family of Sir Thomas More,' now lost, but known through various copies and through the original sketch, now in the Basel Museum.

On his return to Basel (1529) Holbein painted the group of his wife and two children now in the museum there; and in the following year again took up his work in the council-hall, executing powerful mural subjects of 'Rehoboam,' 'Samuel and Saul,' and 'Hezekiah,' works now destroyed. Probably in the beginning of 1532 he again visited London, whence a pressing invitation from the Basel council was ineffectual to withdraw him. At first he was much employed in London by the German merchants of the Hanseatic League, many of whose portraits he executed. Sketches still remain for the decorations which he designed for these traders of the steelyard on the occasion of the marriage of the king to Anne Boleyn; which, with 'The Triumphs of Riches and of Poverty,' were almost the only symbolical subjects executed at this period, to which are also due the great portrait group at Longford Castle known as 'The Ambassadors,' probably representing Sir Thomas Wyatt and John Leyland, the portraits of Thomas Cromwell, and the exquisite circular miniatures of Henry and Charles Brandon, sons of the Duke

of Suffolk, in the royal collection at Windsor. He also executed many masterly designs for metal-work, and such drawings for the wood-engravers as the title-pages of Coverdale's translation of the Bible (1535) and of Hall's Chronicles (1548). From a letter from the poet BOURDON to Solimar, dated 1536, we learn that Holbein at that time held the appointment of royal painter to Henry VIII.; and in this capacity he executed at Whitehall Palace a mural painting of the monarch and Queen Jane Seymour, with Henry VII. and Elizabeth of York, destroyed in the fire of 1698, of which a copy by Van Leemput exists at Hampton Court, while a portion of the original cartoon is at Hardwick Hall. This latter work and the large-sized miniature in the possession of Earl Spencer are regarded by Woltmann as the only surviving authentic portraits of the king from Holbein's hand among the many bearing his name. His delicate and exquisite portrait of Queen Jane Seymour is in the Belvedere, Vienna. To the same period is referable the admirable half-length of Sir Nicholas Carew, Master of the King's Horse, at Dalkeith Palace, and the noble portrait of Hubert Morett, the jeweller, formerly attributed to Leonardo, in the Dresden Gallery.

Holbein was repeatedly employed abroad on the king's service. In 1538 he was despatched to the court of the Netherlands to paint a likeness of Christina of Denmark, who had been proposed as a successor to Jane Seymour as queen to Henry VIII. In a three-hours' sitting he executed a sketch 'very perffight'; and from this he produced the noble full-length in the possession of the Duke of Norfolk. This work is one of the painter's choicest masterpieces, most attractive in the quietude of its execution and in its rendering of feminine sweetness and innocence. In the same year he appears to have been in Burgundy upon the king's business; and in July 1539 he was despatched to the court of Cleves, where he painted Anne of Cleves—'expressed her image verve lyvelye'—in a work now in the Louvre; while about 1540 he executed the striking portrait of the Duke of Norfolk, uncle of Queen Catharine Howard, of which the original is at Windsor, and an old copy is preserved at Arundel Castle. The last work upon which Holbein was engaged was the picture of 'Henry VIII. granting a Charter to the Masters of the Barber-Surgeons Company,' still preserved in their guildhall. It was left incomplete at the time of his death by the plague, which, as the discovery of his will by Mr Black in 1861 has proved, occurred in London between 7th October and 29th November 1543, eleven years earlier than was previously believed.

Holbein is seen at his highest in his portraiture; and in this department his expressional power, his veracity and dignity, and his noble technical qualities of unerring draughtmanship, subtle and perfect modelling, and richness and force of colouring entitle him to rank with the greatest masters. It is his power as a portraitist that gives value and impressiveness to his religious subjects. He has little of the imaginative force, the visionary power, which stamps the works of an artist like Dürer; but his foot treads very firmly upon the earth, and the faces and forms which he bestows upon his sacred personages are full of homely truth, and a simple, moving pathos. As an ornamentalist he ranks as the equal of the greatest Italian masters, his work of this class being distinguished by easy seizure of form, great nobility of design, and the most exuberant richness of fancy.

Many works by Holbein were included in the South Kensington Portrait Exhibition of 1866, in the Royal Academy Old Masters' Exhibition of 1890, and in the Tudor Exhibition of 1890;

but in all of these exhibitions many portraits were quite erroneously attributed to his brush.

See *Holbein und seine Zeit*, by Woltmann (2d ed. 1874-76; trans. 1872); a book by A. Schmid (1892); English works by Wornum (1867) and Cundall (1879); the Life by Knackfuss (1897; trans. 1900); *Hans Holbein the Younger*, by G. S. Davies (1903); and *Hans Holbein the Younger*, by A. B. Chamberlain (1913).

Holberg, LUDVIG, BARON HOLBERG, the creator of modern Danish literature, was born at Bergen in Norway, 3d December 1684. He took his degree at Copenhagen, and spent some fourteen years partly as private tutor and partly in travel, in the course of which he visited England (where he studied two years at Oxford), France, Italy, and Germany. In 1717 he was appointed professor of Metaphysics at Copenhagen, but in 1720 exchanged that chair for the more lucrative one of Eloquence. The works that laid the foundation of his fame were satirical poems—first and foremost the seio-comic epic, written in iambics, of *Peder Paars* (1719-20), in which he ridicules the pedantic stiffness and stupidity of contemporary life and thought, and after this *Hans Mikkelsen's Jestings Poems* (1722) and *Hans Mikkelsen's Metamorphoses* (1726). But in 1721 the first Danish theatre was opened at Copenhagen, and Holberg tried his hand at comedy-writing, with, as it turned out, marvellous success. His excellent light comedies, on account of their genuine wit, comic humour, and skilful character-drawing, are counted by the Danes amongst the best things in all their literature. They were published by their author in a collected form in 1723-25, and again, with five new plays added, in 1731-54. In 1730 Holberg became professor of History, and seven years later questor of the university; and in 1747 he was ennobled. He died at Copenhagen on 28th January 1754. Perhaps the most noticeable feature in Holberg's character is the versatility of his genius. After 1724 he again turned his pen to history, and wrote, amongst other books, a *History of Denmark*, a *General Church History*, a *History of the Jews*, and *Comparative Biographies of Great Men and Women*, all greatly esteemed, particularly the first. Then in 1741 he produced another classic of Danish literature, the satirico-humouristic romance *Niels Klim's Subterranean Journey*; and lastly he wrote serious reflective works, *Moral Thoughts* (1744) and *Epistles* (1748-54). His *Autobiography* (1727-43) should also be mentioned.

The Holberg Society published his *Comedies* in 8 vols. 1848-53 (new ed. 1884). See books by Rahbek (1815-17), Werlauf (1838), Prutz (1857), Brandes (1885), Olsvig (1895, 1912), and O. J. Campbell (*The Comedies of Holberg*, 1914; including an account of his life). Some of his plays have been translated by Hime (1912) and by O. J. Campbell and F. Schenck (1915).

Holborn, a central metropolitan borough of London, contiguous on the east with the city of London, on the south with the city of Westminster. The name is derived from *Hole-bourne*, 'the stream in the hollow,' in allusion to the Fleet, the valley of which is now crossed by Holborn Viaduct, constructed in 1869. The main thoroughfare runs east and west under the names of Holborn Viaduct, High Holborn, and New Oxford Street, the second containing some of the oldest buildings in London. The better residential district is mainly in the part of the borough known as Bloomsbury, formerly as fashionable a quarter as the areas comprised in the parish of St Giles in the Fields, and in Saffron Hill, the one on the southern, the other on the eastern confines of the borough, were disreputable. Hatton Garden is the centre of the diamond trade. Buildings and institutions of note are the chapel of St Etheldreda, the City Temple, Lincoln's Inn, Gray's Inn, with the formerly attached Staple Inn

and Barnard's Inn, the Foundling Hospital founded by Thomas Coram in 1739, the British Museum, the Soane Museum, and the Royal Colleges of Surgeons, Organists, and Veterinary Surgeons. The borough returns one member to parliament. Pop. 43,000.

Holbrooke, JOSEF CHARLES, composer, conductor, and pianist, was born at Croydon, 5th July 1878, and educated at the school of the church of St Ann's, Soho, where he was a chorister, and at the Royal Academy of Music (1893-96), where he gained many distinctions, small success, however, attending his career till the production in London in 1900 of his symphonic piece *The Raven*. Thereafter he wrote numerous orchestral works, several operas and ballets, and in London and the provinces became prominent in chamber music. He has travelled in the United States, in the West Indies and elsewhere. See R. Lowe, *Josef Holbrooke and his Work* (1920).

Holcroft, THOMAS, playwright and novelist, was born in London, 10th December 1745 (o.s.). His father, in whom fondness alternated with fury, was by turns a shoemaker, horse-dealer, and pedlar; and he himself, after three years as a Newmarket stable-boy, then eight as shoemaker, schoolmaster, and servant-secretary to Granville Sharpe, in 1770 turned strolling player. He never was much of an actor, best in low comedy and old men's parts; and, after settling in London (1777), he gradually took to authorship. *Alwyn, or the Gentleman Comedian* (1780), was the first of four novels; *Duplicity* (1781), of upwards of thirty plays. Of the latter, *The Follies of a Day* (1784), adapted from Beaumarchais' *Mariage de Figaro*, brought him more than £600; and *The Road to Ruin* (1792), £1300. Between these befell the great sorrow of his life, the death of his eldest son, William (1773-89), who having robbed his father of £40, and been found by him on an American-bound vessel, shot himself: for a twelvemonth the stern, strong man hardly quitted the house. An ardent if peaceable democrat, in 1794 he was tried for high-treason with Hardy, Horne Tooke, and nine others. The proceedings fell through, but the animosity of party spirit entailed a run of ill-luck at the theatres, which, combined with unfortunate speculations, led Holcroft to sell off his books and effects (1799), and to retire for four years to Hamburg and Paris. He died 23d March 1809. See the interesting *Memoirs*, written by himself, and continued by Hazlitt (1815); also Kegan Paul's *William Godwin* (1876); and Colby's bibliography (N.Y. 1922).

Holden, SIR ISAAC, one of the inventors of lucifer matches and of important modifications in wool-carding machinery, was born 7th May 1807, at Hurlet, Renfrewshire, his father having been a Cumberland farmer and lead-miner. While a worker in a cotton-mill in Paisley, he fitted himself for the post of an assistant-teacher, first at Leeds, then at Huddersfield, and latterly at Reading. Finding flint and steel inconvenient when he got up at 4 A.M. to pursue his studies, he hit on the idea of putting sulphur under explosive material, which solved the problem of the lucifer match. The principle he expounded to his pupils at Reading in 1829, and through them it seems to have become known in London. Holden was not himself aware that lucifer matches had been made nearly two years before by John Walker, a chemist of Stockton-on-Tees, who sold them in April 1827 at one shilling and twopence a box. While book-keeper in a worsted-mill at Bingley, Yorkshire (1830-46), Holden became possessed with the ambition of inventing wool-combing machinery. In 1846 he joined with Mr Lister, who had done

much to improve the system of wool-combing, in starting a mill at St Denis, near Paris. The rude wool-combing by steel teeth was done away with by Holden's square motion machine in 1850. Lister retired, and the firm became Isaac Holden & Sons in 1859, and the Alston works near Bradford were founded. After the expenditure of about £50,000 in experiments, Holden's wool-combing machinery brought him both fame and fortune. Holden was member for Knaresborough 1865-68, for the West Riding (North) 1882-85, and for the Keighley division of Yorkshire from 1885. He was made a baronet in 1893, and preserved his vigorous health till shortly before his death on 13th August 1897.

Hölderlin, FRIEDRICH, German lyric poet, was born 20th March 1770 at Lauffen, in Württemberg, studied theology at Tübingen, was a friend of Hegel and Schiller, was tutor in the house of Charlotte von Kalb, and later (1795-98) in that of a Frankfurt banker, Gontard. Frau Gontard, with whom he read Greek, the 'Diotima,' of his poems and of his novel *Hyperion*, an accomplished woman of exalted ideals, became an inspiring force; but her husband's discovery of how things stood led to Hölderlin's removal from Frankfurt, followed by secret correspondence, and soon afterwards by the death of Diotima and Hölderlin's insanity, which continued with intervals to his death, 7th June 1843. He was author of a tragedy, *Empedokles*, and some translations from the Greek, but his fame rests on his lyrics, full of pantheistic fervour, the finest fruit of German Hellenism. See a *Life* by Litzmann (1890), *Die Briefe der Diotima* (1922), and a *Study* by Montgomery (1923).

Holderness, the name of a parliamentary division (including Beverley, Hedon, &c.), and of a wapentake in the East Riding of Yorkshire.

Holding, the term in Scots law used to denote the manner in which heritable estate is holden, and corresponding to Tenure (q.v.) in English law. See also **FEU**.

Holibut. See **HALIBUT**.

Holiday, in Law, means Sunday, Christmas-day, Good Friday, and any other day appointed for a public festival or fast. In Catholic times holidays were numerous; but modern legislation and custom have considerably reduced their number. Of late years the importance of holidays to working people has been recognised, and acts have been passed increasing the number of bank holidays. When a bill of exchange falls due on a Sunday, payment must be made the day previous. If it falls due on any of the bank holidays, the bill is payable the day after. In England the courts excuse a man for not giving notice of dishonour of bills of exchange not only on Sunday, Good Friday, and Christmas-day, but also even on the festival days of his own religion; and, though there has been no decision in Scotland on the subject, the same rule would no doubt be applied to fast-days prescribed by different sects, and a notice sent on the day following would suffice. But as a general rule, and in all other respects, it may be laid down that no sect, established or unestablished, nor any court or public body, has any power whatever to declare a holiday which has any legal effect, or which can bind the public or the rights of third parties. Nothing but an act of parliament has that effect, and not even a proclamation of the crown would be sufficient. Hence it is that when a solemn national fast is proclaimed, which is to be put on the same footing as a Sunday, it requires a special act of parliament to make it binding on the public in matters of business. See **BANK**

HOLIDAYS; and for ecclesiastical and popular holidays, see **FESTIVALS**.

Holinshed, RAPHAEL, an English chronicler, belonged to a good Cheshire family, and, according to Wood, was educated at one of the universities, and became a 'minister of God's word.' He appears also to have been steward to Thomas Burdet of Bromcote, in Warwickshire, and died between 1580 and 1584. The work with which his name is connected is *The Chronicles of England, Scotland, and Ireland*, published in two folio volumes in 1577. This edition, together with its predecessor, the *Chronicle of Hall*, was the direct source from which Shakespeare drew the materials for his English and Scottish historical and legendary plays.

The first edition of Holinshed contained many woodcuts which were omitted in the second edition (3 vols. folio; usually bound in two, 1586-87), as well as a number of passages cancelled by order of the Privy-council as disagreeable to Queen Elizabeth. These castrations were published separately in black letter like the original, by Dr Drake in 1723, and are inserted in their proper places in the splendid edition of the *Chronicle* published in six 4to volumes (1807-8). This last edition has the particular merit of an exceptionally full index.

Holinshed was by no means the only writer of the work which bears his name, and, indeed, its whole history is not a little interesting. Early in the reign of Elizabeth the queen's printer, Reginald Wolfe, a German by birth, planned 'a Universal Cosmographie of the whole world, and therewith also certain particular histories of every known nation,' and for the historical part of the work had engaged Raphael Holinshed among other men. When the gigantic work was nearly completed Wolfe died, after twenty-five years' labour at his scheme. Those who were to bear the cost of printing the whole now took fright at the expense, and resolved to do only so much of it in the meantime as related to England, Scotland, and Ireland. Holinshed having the history of these countries in hand, application was made to Harrison to furnish the descriptions of Britain and England to be prefixed to the whole. Of the three volumes in the second edition, the first is made up of these and Holinshed's own history of England till the Conquest. The second contains the Description of Ireland by Richard Stanihurst, the translator of Virgil's *Æneid* into English hexameters, himself a Catholic and the uncle of Archbishop Ussher; then the history of Ireland to its Conquest, adapted from Giraldus Cambrensis, by John Hooker or Vowell, uncle of the Judicious Hooker; next the history of Ireland to the year 1509 by Holinshed; its continuation to 1547 by Stanihurst; and thence to 1586 by Hooker. The second volume contains further the Description of Scotland by Harrison; the history of Scotland by Holinshed, down to 1571, and by Francis Boterville, or Thin, the Lancaster herald, with the help of others, from 1571 to 1586. This was mainly compiled from Bellenden's translation of Boece, John Major, and the continuation of Boece by John Ferreri. The third volume is made up of the history of England from William the Conqueror down to 1577 by Holinshed, and from 1577 down to 1586 by the famous antiquary Stow, Fr. Thin, Abraham Fleming, and others. Holinshed was an honest and industrious man, and had the advantage of being able to consult the manuscripts of Leland. See Boswell-Stone, *Shakespeare's Holinshed* (1896).

Holkar, a powerful Mahratta family, long formidable to the British in India. The founder of the family was Mulhar Rao Holkar, born in 1693, who, having gained by his valour the favour

of the Peshwa, obtained Indore from him. See **INDORE**, **MAHRATTAS**.

Holkham, a Norfolk estate, 2 miles W. of Wells. See **LEICESTER OF HOLKHAM**, **AGRICULTURE**

Holl, **FRANK**, portrait and subject painter, was born in Kentish Town, 4th July 1845, a son of Francis Holl, A.R.A. (1815-84), the well-known engraver. In 1860 he entered the schools of the Royal Academy, where he won gold and silver medals, and in 1863 a two-years' scholarship for the best historical painting by his 'Abraham about to sacrifice Isaac.' His exhibits at the Royal Academy consisted of *genre*-subjects dealing almost invariably with pathetic scenes from modern life, such as 'I am the Resurrection and the Life' (1872), 'Newgate—Committed for Trial' (1878), 'Ordered to the Front' (1880), 'Returned from the Wars' (1881). He was elected A.R.A. in 1878, and R.A. in 1884. About 1877 he turned his attention to portraiture, and speedily attained popularity in this department, his works being marked by a powerful if rather heavy touch and by much dignity of style, though they possess little sweetness of colour, and are somewhat marred by the recurrence of opaque blackness in the shadows. They include 'W. E. Gladstone,' 'Sir William Jenner,' and 'Lord Spencer' (1888). He died 31st July 1888. See the *Life and Work* by his daughter, Mrs Reynolds (1912).

Holland, the popular and generally-accepted name of a country which is officially described as 'Netherland,' or 'The Netherlands,' applies to a maritime kingdom lying between 50° 46' and 53° 32' N. lat., and 3° 22' and 7° 12' E. long. It is bounded on the N. by the North Sea, E. by Prussia, S. by Belgium, W. by the North Sea. Its greatest length from north to south is 195 miles, and its greatest breadth from west to east 110 miles. It contains 12,582 sq. m.—little more than one-tenth of the size of Great Britain and Ireland. Luxemburg was long included, but this grand-duchy had a distinct government as a separate state, and Holland only possessed a dynastic interest in it, which passed away with the death of William III. in 1890 (see **LUXEMBURG**). The following table gives the population of Holland in 1920, the area of the provinces, and the provincial capitals:

Provinces.	Area in sq. m.	Pop. in 1920.	Provincial Capitals.
North Brabant.....	1920	738,986	Bois-le-Duc.
Guelderland.....	1939	729,866	Arnhem.
South Holland.....	1131	1,678,670	The Hague.
North Holland.....	1066	1,298,051	Haarlem.
Zeeland.....	707	245,117	Middelburg.
Utrecht.....	525	342,322	Utrecht.
Friesland.....	1243	382,876	Leeuwarden.
Overijssel.....	1295	438,818	Zwolle.
Groningen.....	881	365,586	Groningen.
Drenthe.....	1028	209,718	Assen.
Limburg.....	847	440,364	Maastricht.
	12,582	6,865,314	

Of this number, 3,410,262 were males and 3,455,052 were females. The population has been steadily increasing: in 1829 it was 2,613,487; in 1849, 3,056,879; in 1869, 3,579,529; in 1889, 4,511,415; and in 1909, 5,853,175. Thus, in spite of increased emigration to America, North and South, and Africa, the population shows 546 inhabitants to the square mile. Holland is the most densely peopled country of Europe after Saxony, England, and Belgium, city states excluded. The population is thinnest in the eastern provinces, and densest in North and South Holland. Of the population in 1920, about 3,500,000 were Dutch Reformed and other Protestants, 2,400,000 Roman Catholics, 115,000 Jews. In 1920 there were twelve towns with more than 50,000 inhabitants—viz. Amster-

dam, Rotterdam, The Hague ('s Gravenhage), Utrecht, Groningen, Haarlem, Arnhem, Nimeguen (Nijmegen), Leyden (Leiden), Tilburg, Maastricht, and Dordrecht.

Physical Aspect.—Voltaire's words, '*Canards, canaux*,' aptly describe the leading features of the country—flat, full of water and waterways, swarming with aquatic birds. Like Egypt, Holland, in its greater part, is a delta formed by the alluvium deposited by the great rivers that flow through it into the North Sea. But Holland is not only flat; it is also hollow. In a large measure the soil lies under the level of the water, salt or fresh. Along the canals the meadows are 10 or 12 feet, sometimes more, beneath the water-line; by the sea, at high tide, there may be a difference in the level of the soil and of the ocean of quite 25 feet or more. Of course, all these lands have to be protected by embankments or dykes, the tops thereof, broad and flat, being used for carriage-roads and foot-paths. The constant battle of the Hollanders against the watery element finds expression in the motto of the province of Zeeland: *Luctor et emergo*! They utilised the mighty rivers, the Rhine, Waal, and Maas, that traverse and fertilised their country, at an early date; and they have covered the land with a network of canals that is probably unique in the whole world. Apart from forming convenient boundaries, these canals serve a twofold purpose: they are mostly navigable for small craft, and they help to irrigate the land. Large windmills are posted at the main points to pump out the superfluous water; hence they form a conspicuous feature of Dutch landscapes. Other windmills near the towns and villages frequently work for different purposes, but they are one and all remarkable for their peculiar shape and the enormous size of their sails, one single sail reaching often to 120 feet. The steam-pump, however, has gone far to supplant the windmill, and has given place in turn to the electric pump. The canals also provide, when frozen, an important medium of communication to skaters. Some of them date back for centuries; the most ancient is certainly the *fossa Drusi* in the east, made in the time of Augustus, and referred to by Tacitus. Many canals, regulated by locks (which were probably known in Holland a hundred years before they were introduced into Italy in the 15th century), connect the parallel rivers, and the Yssel forms a link between the Rhine and the canals and meres of Friesland. The latter are vast and somewhat shallow lakes. Thus it is possible to travel on water through the whole of Holland. The principal canals are the North Holland Canal, from Amsterdam to Den Helder, 51 miles long; the William's Canal, through North Brabant and Limburg, which has a length of 71½ miles; the North Sea Canal, from Amsterdam to Ymuiden, on the German Ocean; and the canal from the Maas, near Rotterdam, to the so-called Hoek van Holland, named the New Waterway, which now enables ocean-steamers to reach Rotterdam at all times. We have already described the most important (see **CANAL**). The cutting and maintaining of canals in Holland is one of the chief functions of the Waterstaat, a public department that is carried on under an independent minister of the crown, and is entirely confined to hydraulic engineering. The reclamation of land by the drainage of lakes, and by pushing back the sea and creating what are styled 'polders,' is likewise a leading feature in the operations of the Waterstaat. These newly-reclaimed polderlands always fetch high prices amongst the agricultural classes, as was the case with the Haarlem Lake (q.v.) polder, which was sold in plots at such prices that the state made an excellent bargain. The draining of Haarlem Lake will be eclipsed when the scheme of laying

dry the Zuider Zee (q.v.), which involves an estimated outlay of £15,750,000, is carried out. This was sanctioned by parliament in 1918. A dam some 30 kilometres long is to connect the coasts of North Holland and Friesland. Within it are to be four reclaimed areas around a freshwater lake (Flevo). Thus Holland will acquire a new province of about half a million acres.

The maintenance of dykes by the Waterstaat forms another task of vital moment; the safety of the state depends upon their constant strength and resisting power where there are no hills or dunes to offer a natural protection against the encroachments of water. It is a mistake to suppose that the ocean is Holland's most treacherous and formidable foe; the rivers, when swollen by heavy rains or falls of snow, are much more dangerous. As the riverbeds naturally rise by alluvial deposits, the embankments have to be made higher and higher. In times of peril a special dyke service is organised, and headquarters are kept informed night and day by a body of Waterstaat engineers, who direct their trained workmen to the points that are more immediately threatened. Dykes form a very expensive item in the budgets of Holland. Besides, many dykes are almost entirely maintained out of local rates. The most formidable and costly sea-dykes are round the western coast-line of Walcheren Island, and near Den Helder in North Holland. These dykes are veritable ramparts, formed by piles at the base, which support a superstructure of earth and stones. Ferro-concrete is now much used. Despite the care and precautions of ever vigilant and ingenious men, disasters through inundations form but too familiar a feature in the history of Holland. A series of irruptions of the ocean created the Zuider Zee between 1170 and 1395. As Goldsmith says in his *Traveller*, the Dutchman has 'scooped out an empire' from the ocean, and the old Dutch proverb that God made the sea but the Hollander the land holds true to this very day.

Communications.—The oldest railway of Holland is the line connecting Amsterdam and Rotterdam by way of Leyden, which was commenced in 1837. The principle of state railways was settled in 1860, and extended in 1873 and 1875. The whole country is now covered by a network of railways built out of state funds. They are not worked by the government, but by a company, which pays the treasury a certain proportion of the net profits. There are several private railways, but the present tendency is to make them state properties. The country roads, mostly paved with bricks, are broad and excellent. The old-fashioned way of navigating the canals in *trek-schuiten*, or boats drawn by horses, or men and even women, on a towing-path is disappearing.

Climate, Agriculture, Produce.—The climate of Holland is much like that of England, especially in its frequent and rapid changes; but, as a rule, the Dutch summer is hotter and the winter colder.

Agriculture in its various branches forms one of the leading pursuits of the Dutch. Land-tenure is similar to that in France, and fee-simple with peasant-proprietorship the rule. The number of small-holdings has increased; the number of agricultural labourers gone down. Cattle-rearing and dairy-farming have been the Dutch farmer's chief occupations from time immemorial. This explains why arable land in Holland only covers an area of some 900,000 hectares, while pasture covers 1,230,000 hectares. The farm-stock in the year 1921 consisted of 364,000 horses, 2,000,000 head of cattle, 668,000 sheep, and 1,519,000 pigs. Dutch sheep, exceptionally large in size, Dutch cattle, Friesland horses, which are extremely strong, and Holland trotters, are much esteemed abroad; and great

numbers have been exported alive (for breeding and use) and dead. Dairy-farming had fallen off very much, especially in Friesland, once famous for its butter, because the Dutch dairy-farmers clung to antiquated methods, and so were outstripped by foreign competitors. But, taught by disastrous experience and the example of Denmark, the Dutch dairy-farmers introduced the 'factory system' and other improvements. The government assists by instruction and control. The common Dutch cheese comes from Gouda, and the round balls are from Edam in North Holland. The staple agricultural products are wheat, rye, oats, potatoes, beet-root, chicory, flax, and tobacco. The use of modern implements spread rapidly, like the application of artificial manures, which are more used than in any other part of the world. The soil of Holland is not uniformly fertile. Large tracts of land, especially in the eastern provinces, are simply heath; such lands covered an area of more than 466,000 hectares in 1922. Much has been done in afforestation of these tracts. The orchards of Boskoop, producing excellent fruit, like the prolific district of Westland, should be mentioned, as also the famous culture of Dutch bulbs at Haarlem and the surrounding districts.

Minerals.—As may be readily believed, minerals are scarce in Holland; but valuable clay for the manufacture of tiles, bricks, and pottery is found everywhere in great abundance, and the making of the famous old Delft-ware is now reviving. Coal and a soft sandstone are worked in Limburg, and coal also at Winterswijk, near the Westphalian frontier.

Manufactures, Industries, &c.—The chief manufactures are linen, woollen, cotton, and silk fabrics, paper, leather, glass, &c. Cotton goods are manufactured at Leyden, Amersfoort, Middelburg, and Amsterdam; while 's Hertogenbosch, Utrecht, and Tilburg are noted for woollen goods (blankets and cloths). Calicoes, shirtings, drills, table-cloths, striped dimities, &c., are made at Almelo, Amersfoort, and other leading towns. Excellent imitation Smyrna carpets are manufactured at Deventer; turkey-red yarns, dyed silks, and silk stuffs at Utrecht and Haarlem; leather, glass, firearms, at Maastricht and Delft; iron-founding, rolling and hammering of lead and copper, cannon-founding, are carried on at The Hague, &c. Breweries are numerous: Middelburg, Bois-le-Duc, Amsterdam, Nimeguen, &c., have important ones, those of Bois-le-Duc and Amsterdam manufacturing large quantities. Gin is distilled at Schiedam ('Hollands'), Delft, Rotterdam, and Amsterdam. Brandy and other spirits are distilled in several towns. Amsterdam has a very important diamond-cutting trade. Haarlem has a considerable trade in bulbs, while Delft has been noted for its pottery. Sugar-refining was carried on by several establishments, and there are also beet-root sugar factories and salt-works. The manufacture of cocoa has assumed enormous proportions, and there are large works at Weesp, at Amsterdam, and at Rotterdam. Ship-building is carried on at Rotterdam, and book-printing at Amsterdam and 's Hertogenbosch. North Brabant is the principal centre of the Dutch margarine trade. Most of the margarine used in England comes from Holland.

Fisheries.—The fisheries of Holland, although no longer so important as at one time, are still noteworthy. They give employment to some 17,000 men and boys, on board 5500 vessels. Trawling is extensively resorted to. 'Dutch cooping' has been virtually abolished by the international North Sea Conventions (see COOPERAGE). A great proportion of the oysters taken are exported to England.

Imports, Exports, and Shipping.—The Dutch are

no longer the 'carriers of Europe,' but their carrying trade is still very considerable. The total imports for home consumption and exports of home produce were, in 1923, £167,435,500 and £108,602,000; and the imports from and exports to the United Kingdom in 1922 were £29,416,000 and £37,095,000 respectively. The principal exports to the United Kingdom are margarine, condensed milk, sugar, paper and strawboard, cheese, butter, tomatoes, flax, fish. In 1922 the mercantile marine consisted of 214 sailing-vessels of a burden of 20,000 tons, and 660 steamers of 1,280,000 tons.

Colonies.—The colonies of Holland have a total area of about 788,000 English square miles, and an approximate total population of 50,000,000. They fall into two groups: (1) the East Indian possessions (Netherlands Indies), including Java and Madura, Sumatra, the Moluccas, Celebes, Timor, parts of Borneo, and the western part of New Guinea; and (2) the West Indies, of which the chief are Surinam (see GUIANA) and Curaçao. The factories on the coast of Guinea were disposed of by sale to Great Britain in 1872. The principal colonies are treated at length in separate articles. A 'Volksraad,' first assembled in 1918, marked a revolution in the administration of the Dutch East Indies; but its results were less important than had been hoped for, as it was not felt to be practicable to grant responsibility. Further changes in the direction of self-government and decentralisation were made in 1922. For the Dutch in South Africa, see the articles BOERS, CAPE OF GOOD HOPE, TRANSVAAL, &c.

Government.—The government of Holland is a limited constitutional monarchy. The modern *Grondwet*, or Constitutional Law, of 1848, was altered in 1887, 1917, 1919, and 1922 to suit new electoral and other requirements. The crown is the executive power; legislation is vested in the States-general. The king presides at a council of state, whose members are appointed by him; its functions are similar to those of the Privy-council in Britain. He also selects ministers, who countersign all royal decrees, and whose responsibility is settled by a special law. The States-general is divided into a first and a second chamber. The second chamber consists of one hundred members, the first chamber of fifty members, the former being elected by direct suffrage, the latter by the provincial councils. The members of the second chamber are elected for four years. Male and female subjects twenty-five years old, in the full possession of their civic rights, are electors. The members of the first chamber are elected for a term of nine years. No one can be a member of the two chambers simultaneously. Ministers may sit in both, but only possess a consultative voice if not members. The second chamber alone has the right of amendment and of initiating legislation. All judges are appointed by the crown for life. There is a supreme tribunal (at The Hague), and ministers, members of the States-general, and certain high officials can be arraigned only before it. There is no state religion, but the state supports financially the different churches.

Education.—Primary instruction, made obligatory in 1900, is provided by the state in all places where required. Private schools are freely permitted, and denominational schools (since 1917) share the public funds with undenominational. Teachers must qualify under a government examination. The state, the province, and the commune all bear part in the support of schools. There are ancient universities at Leyden, Utrecht, Groningen, and Amsterdam. The four universities have upwards of 6000 students. Several technical institutions have the status of universities, and confer degrees—the Technical University at Delft, Rotterdam school of

commerce, Utrecht veterinary school, Wageningen school of agriculture. There are Latin schools in the leading municipalities.

Army, Navy, &c.—The strength of the regular army in Europe is about a quarter of a million. There is also a colonial army of about 35,000, of whom 6000 are Europeans. The Dutch home army is composed of volunteers, and of a varying proportion of men drawn by lot. North and South Holland can be inundated at short notice.

The navy, for home defence and the East Indies, is recruited in a similar manner to the army, and has a *personnel* of about 5000 officers and men.

History.—About a century and a half before our era a Teutonic people, known to the Romans as the Batavi, who came from Hesse, occupied the land between the Rhine and the Waal. At this time the Frisians occupied the country north of the Rhine to the Elbe. The Batavi and Frisians differed little in appearance, manner of life, and religion. They clothed themselves with skins, fished, hunted, and led a pastoral life; were faithful, frank, chaste, and hospitable. The songs of the bards composed their literature and history. Warlike and brave, they selected their leader for his courage and prowess, and were armed with a bow and a short spear. They worshipped the sun and moon, and held their meetings in consecrated woods.

The Romans having subdued the Belgæ, next attacked the Frisians, who agreed to pay a tribute of ox-hides and horns, but continued restless and rebellious. The Batavi became allies of Rome, paying no tribute, but supplying a volunteer contingent, chiefly of cavalry, which was renowned for its impetuous bravery, and helped to win the battle of Pharsalia for Cæsar. About 70 A.D. Claudius Civilis, a Batavian, made a bold effort to overthrow the Roman power in Rhenish or Germanic Gaul, but failed in the end. Roman supremacy endured until the 4th century, when the inroads of the Salic Franks were followed by the Saxons and other tribes. The Franks took possession of the *Insula Batavorum*, and the name of the Batavi vanished. Christianity spread among these tribes, and even the Frisians, who were violently opposed to it, were forcibly converted by Charles Martel. At the end of the 8th century all the Low Countries submitted to Charlemagne, who built a palace at Nimeguen, on the Waal. The feudal system now began to develop itself, and dukedoms, counties, lordships, and bishoprics arose, the bishops of Utrecht, the dukes of Guelderland, and the counts of Holland being among the most powerful of these petty rulers, who owned but very little allegiance to their lords. During the 9th and 10th centuries the districts of the modern Netherlands belonged to Lotharinga, which acknowledged alternately French and German sovereignty. The nucleus of the countship of Holland, and the beginning of its power, were the work of Dirk III., who died in 1039. Count William II. was even made King of the Romans (1248) through the influence of Pope Innocent IV. The Crusades weakened the power and resources of the nobles and prelates, so that, during the middle ages, cities began to assume importance, strengthen themselves with walls, and choose their own rulers.

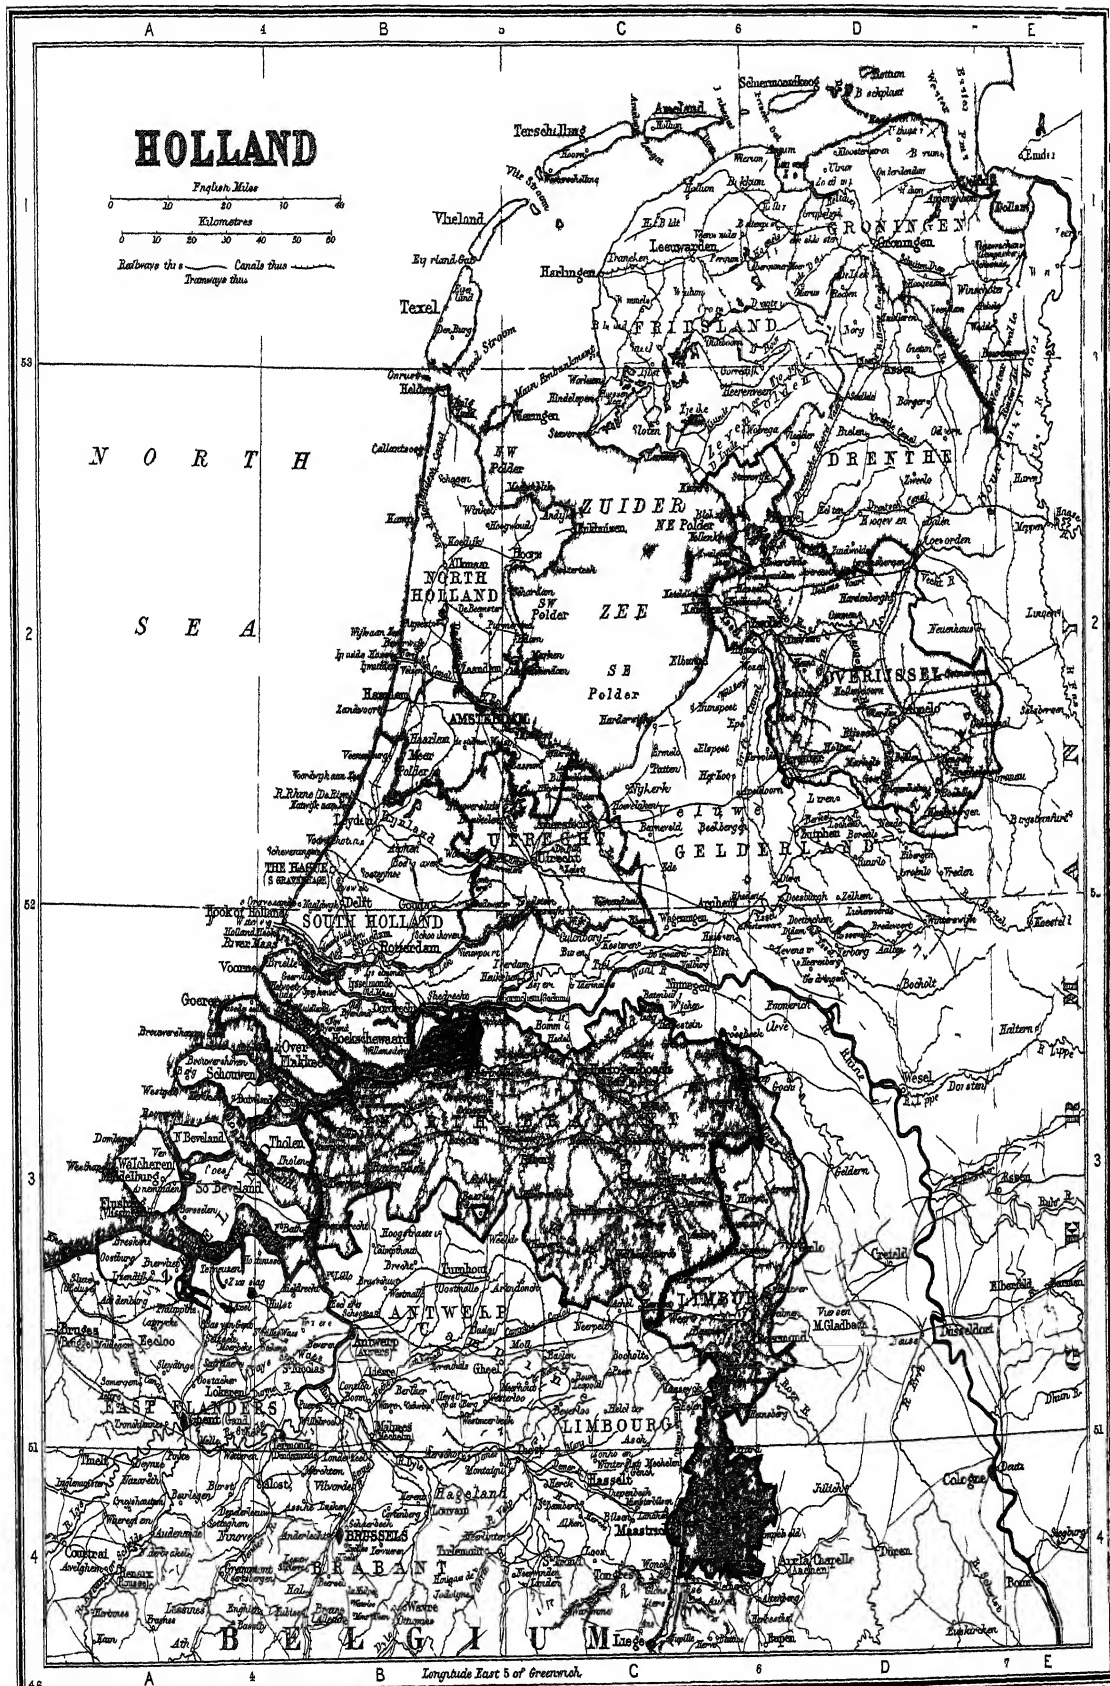

In 1384 the earldom of Flanders passed, through marriage, to the Duke of Burgundy, whose grandson, Philip the Good, made it his special life-effort to form the Netherlands into a powerful kingdom. He bought Namur, inherited Brabant with Limburg, and compelled Jacoba of Bavaria to resign Holland and Zeeland. Charles (the Emperor Charles V.), as heir to Burgundy, inherited and united the Netherlands. He fostered trades and industries in the Low Countries, and under his rule they attained

a great prosperity, whilst cities like Bruges and Ghent reached the zenith of their wealth and power. But he also tyrannised over the land with an iron will and hand, drained the life-blood of the nation for his continual warfare, and depopulated north and south by an implacable Inquisition, which it is computed put to death in various forms at least 100,000 persons for heresy. Yet he was at times popular with the people. He spoke their language. He always remained a Fleming; and Ghent, after attempting to betray him and rising in rebellion against him in 1539, owed her ultimate escape from the destruction which Alva counselled entirely to the fact of the emperor's citizenship. His son Philip II., who succeeded to the throne in October 1555, was a character of the very opposite type. A Spaniard born, he remained a Castilian to his dying day—austere, harsh, narrow, domineering, fanatical. He never spoke a word of Dutch, nor did he understand the people. With Philip II. commenced that terrible and desperate and long-fought struggle of Holland and Spain which finally resulted in the throwing off of the Spanish yoke, in the establishment of a free, strong, and prosperous commonwealth among the marshes of the low-lying delta. This heroic contest of the few against the many, of a handful of isolated burghers against the combined forces of the most powerful state in Europe, has excited a wonderful amount of interest in the civilised world. Motley, with the now countless editions of his great work, *The Rise of the Dutch Republic*, and its continuation, has done more to popularise the story of the so-called Eighty Years' War of the Low Countries against Spain than any of his predecessors.

Philip II. only remained in Holland for four brief years and then left it, never to return, appointing as regent Margaret of Parma, mother of the famous Farnese, and a natural daughter of Charles V., with a council, to which belonged Viglius, Berlaymont, the afterwards notorious Cardinal Granvella, Bishop of Arras—all friends and flatterers of the young king and enemies of the people—as well as Egmont, who had won the battles of St Quentin and Gravelines for Philip, and the king's lieutenant in Holland, Zealand, and Utrecht, young William of Orange, then completely unknown to fame. As the latter took leave of Philip, who was embarking at Flushing to return to Spain, the king bitterly complained to him of the opposition already manifested against his measures. These were mainly the maintenance of a standing Spanish army and of the Inquisition—both contrary to the laws and privileges of the people, as well as to his own solemn vows before ascending the throne. Orange tried to persuade the king that he had nothing to do with the resistance complained of, as the Estates were acting on their own responsibility when they had petitioned his majesty. Whereupon Philip seized the Prince of Orange by the wrist, shaking it violently, and exclaiming in Spanish, *No los Estados, ma vos, vos, vos!* ('Not the Estates, but you, you, you!'). The king on this memorable occasion showed as much perspicacity as his reign betrayed perverseness and perfidy. In William of Orange, then only twenty-six years old and six years his junior, Philip had truly recognised his worst foe, his most dangerous opponent, and the soul of the coming struggle against the royal authority. The king's secret correspondence is there to confirm this view. Born on 16th April 1533, William belonged to the ancient German family of the Counts of Nassau, and had inherited the Principality of Orange (q.v.), in the south of France; but his ancestors had settled in the Netherlands, where they occupied high functions under the princes of the House of Burgundy.

William had been a favourite with Charles, whom he accompanied everywhere. It was thus that William had been able to acquire that profound knowledge of the military art, and to grasp the intricacies of the prevalent occult diplomacy in which he afterwards proved himself such a consummate master. It was while he was hunting with the king of France in the forests of Vincennes that Henry II. communicated to William of Orange the fiendish plot France and Spain had concocted to massacre all the Protestants in both countries. Henry II. did not know then the man to whom he had been so communicative: he had spoken to William the Silent. The prince never betrayed the least emotion. He buried in his bosom the project of a crime which, a devout Catholic himself (though a Protestant afterwards), he had resolved to prevent at all hazards. He saw the storm coming. He determined to face it, to devote his fortune, his best powers, and his life to the cause of the weak against the strong, of the free against crushing despotism, fighting Philip with his own weapons, and having but one noble, self-sacrificing ambition—the welfare and the liberty of the people.

There is no doubt that Philip was betrayed by those in whom he had most implicit confidence, and that William of Orange knew of all the king's intentions and movements. Thus he was aware that Alva had collected an army in Italy by the orders of Philip in order to extirpate an abominable rebellion of heretics by sword, and re-establish the Inquisition. The prince warned his friends Egmont and Hoorn in good time against the imminent danger; but they heeded not what he said, and paid for their folly on the scaffold of Brussels as soon as Alva had arrived there with 10,000 picked troops and had established his Council of Troubles. This was no better than a council of butchers, and by means of it 20,000 inoffensive burghers were hurried to their doom. William escaped to Germany in order to organise the national defence with his brothers. But his task was well-nigh hopeless. What could he do with a handful of half-paid and under-fed hirelings? In 1572 the position of affairs could scarce have been more desperate. The Spaniards were absolute masters of the land, and the people, crushed under a reign of bloody rapine, had ceased to hope for deliverance, when the bold capture of Briel, by the Beggars of the Sea, on the 1st of April 1572—a great date in Dutch history, duly honoured in 1872—changed the whole aspect of affairs. They were marauders, those Beggars of the Sea, desperadoes clinging to the broad, hospitable ocean, after having been driven from the land by the Spaniard; but they were also patriots who had adopted as a title of honour the opprobrious epithet that Berlaymont had given them when they were petitioning the regent for the maintenance of their rights, and they held Briel for 'Father William.' Their daring capture became the sign of a general revolt, and soon William the Silent was again at the head of affairs, 'in the name of the king,' still nominally maintained as the ruler of the land. Orange's projects, which consisted of a junction with the French Huguenots, were indeed direfully frustrated by the butchery of St Bartholomew. The southern portion of the Low Countries could not be delivered from the clutches of the enemy and were for ever lost to the cause of freedom; but the north continued the struggle single-handed, and at last Alva had to depart in disgust without having accomplished his mission. His successors could do nothing to retrieve Philip's fortunes or damp the inspiring influence which the heroic defence of towns like Haarlem, Leyden, and Alkmaar had infused into the burghers of the new state. The military chest of the Spanish commanders was always empty, as the Dutch,

masters on the sea, cut off all supplies, and revolts were frequent among the Spanish soldiery. Ottavio Farnese, Duke of Parma, who succeeded to the lieutenancy in 1578, saw but one way of settling the question, and that was the forcible removal of William of Orange. Philip, who had held all along the same sinister designs, was only too eager to fall in with this plan. In June 1580 there appeared that infamous ban, which declared William a traitor, a miscreant, and an outlaw, putting a heavy price upon his head (25,000 gold crowns), and promising the king's pardon and titles of nobility to whosoever might be found willing to rid the land of him. William replied in his famous *Apologie*; but he was not able to cope with a royal assassin. Numerous attempts against the prince's life were made, and although they failed for a time, the bravo's work was finally accomplished. Balthasar Gerards, the miserable instrument of a royal murderer, shot William dead with a pistol, purchased with the very money the prince had given him by way of alms to a 'poor Calvinist.' This took place at Delft on 12th July 1584, near the top of a staircase which has been preserved in the same state ever since. Gerards was arrested, tortured, and finally put to death in an atrocious manner; but no expiation, however awful, could bring to life again the noble patriot.

The blow was crushing and irreparable, yet William might have fallen at a moment even more critical to Holland than July 1584. He did not leave his country in a state of paralysed chaos. The Union of Utrecht, accomplished in January 1579, had cemented the alliance of the northern provinces banded together against the king of Spain; and the solemn declaration of July 1581, by which the free Netherlands for ever renounced their allegiance to Philip II., had virtually completed William's task of deliverer. His manifesto of renunciation and denunciation would alone have sufficed to stamp him as a man of genius in the eyes of posterity. It is a remarkably clear, bold, and spirited defence of a people's rights against the claimed rights of the anointed king at a time when the former had been forgotten. Yet William's doom, far from undoing his work, as Philip and Parma hoped, only tended to make it more durable. The bloody deed seemed to spur the whole nation to a revolt fiercer than ever. Maurice of Nassau followed in his father's footsteps, and the successes of the Dutch, especially at sea, became more numerous. Parma, indeed, took Antwerp after a long siege, but failed to effect a junction with the Armada in 1588, as the Hollanders prevented his fleet from leaving the Scheldt; and when the great general died in 1592, six years before his master, he had not accomplished his mission. Philip III. was not more fortunate, and could do nothing better than sign in 1609 the twelve years' armistice with the 'rebels,' who were already masters of the sea, had laid the foundations of their great Indian empire by the establishment of the East India Company in 1602, and practically had made their own conditions. Maurice had been against the armistice, but he was overruled by the States, who wanted peace for trading. Unfortunately, the breathing time to 1621 was in a large measure filled up with religious and political dissensions between the adherents of Gomarus, the orthodox Lutherans, and the Arminians, the milder-mannered followers of Arminius, to whom Hugo Grotius and other celebrated men of the time belonged. These disputes culminated in the persecution of the Arminians, who were forced to flee, like Grotius, or were put on their trial for high-treason, like Olden Barneveldt, the Grand-pensionary of Holland, and one of her most distinguished sons, who was beheaded in 1618 with the approval

of Maurice. But these internal troubles did not check the progress of the new republic. Maurice died in 1625, and his brother Frederick Henry finally freed his country from the Spaniards, who in 1648 were compelled to recognise the 'rebels' as an independent nation by the treaty of Munster.

In this epoch lies, perhaps, the period of Holland's greatest material and intellectual development. Her ships could be seen everywhere, and the Dutch had become the general carriers of the world's trade. Amsterdam, grown powerful and rich, was the Venice of the north, where, besides commerce proper, both banking and stockbroking reached a flourishing stage at an early period. From this emporium started the fleets of the great trading companies, and the vessels of intrepid explorers like Hudson, Heemskerck, Houtman, Lemaire, Tasman, and many others. Dutch agriculture and floriculture, gaining new experience and teaching fresh methods, grew famous, and so did many branches of science and industry. The first optical instruments came from Holland, and Huygens gave us the pendulum-clock. Arts and letters flourished, and the names of Erasmus, Grotius, Vossius, Burman, Gronovius, Boerhaave, Spinoza, Huygens, Rembrandt, Cuyp, Ruisdael, Douw, Hals, Hobbema, and many more became known and illustrious far beyond the national frontiers. The art of printing, perhaps not a glory of Holland in its inception (see PRINTING), had at anyrate attained a high degree of perfection there in the 17th century, as the names of Plantin and Elzevir testify. The liberty of the press, secured at an early date, led to the establishment of numerous newspapers, Dutch and foreign. The foreign news-sheets of Holland, mostly published in French, were sent all over the world, as they contained the latest intelligence and things that were not allowed to appear in print elsewhere. The *Gazette de Leyde* was among the oldest and most powerful of these early journals (1680-1814).

The rising power of Holland had the natural result of creating envy and cupidity in her nearest neighbours. The first serious antagonism came from England, where trade and navigation were also rapidly coming to the front. Both countries were then pure commonwealths—Cromwell ruling in England, and the Grand-pensionary Jan de Witt having virtually the destinies of the United Provinces in his hands since the death of Frederick Henry's son, the last stadhouder before William III. Cromwell's Act of Navigation, which aimed at the destruction of Holland's monopoly in the carrying trade, led to the great naval war of 1652-54, during which twelve important battles, more or less decisive, were fought, and both nations distinguished themselves by the intrepid daring of their commanders and seamanship. Yet otherwise the result was barren, though the names of De Ruyter, Tromp, Evertsen, and Van Galen shone forth ever afterwards. These hostilities between Holland and England were renewed when Charles II. had been restored by General Monk; but the war of 1664-67 remained as undecided as its predecessor, despite De Ruyter's daring feat of sailing up the Medway, which caused for a while wild panic in the British capital.

An ensuing war with France, now allied with England against the United Provinces, was much more serious, as De Witt had done his best to strengthen the navy, but at the cost of a totally neglected army. The hosts of Louis XIV., under captains so famous as Condé and Turenne, made short work of all resistance that Holland could offer on land, although De Ruyter's fleet kept the allied squadrons at bay, and thus, probably, saved his country from political annihilation. At the most critical juncture a violent popular reaction

set in against De Witt and his brother Cornelis, and in favour of the young Prince of Orange, who had been held back by their party. Jan de Witt, one of the most clear-headed and bold statesmen of his day, was murdered with his brother by an infuriated mob at The Hague, and the stadthoudership re-established in the person of a prince then (1672) only twenty-two years of age. But the people's instinct had been right after all, for William III's accession proved the salvation of Holland, as it also accomplished, later on, the political regeneration of England. The fortunes of the war changed immediately with William at the head of affairs. He showed himself an able tactician and a still more skilful diplomatist. By dexterously manoeuvring between Holland's enemies he managed to gain time and isolate France. At last, in 1678, Louis XIV. was compelled to sign the treaty of peace of Nimeguen, as William had become, for the time being, the ally of the king of England, by his marriage with Mary, daughter of the Duke of York. William was not satisfied with what the peace of Nimeguen gave to Holland; and the following years were passed in preparing for the great events which he no doubt saw rapidly approaching. The revocation of the Edict of Nantes flooded Holland once more with political refugees, who here found a new fatherland, and who subsequently helped to fight the battles of Europe against their common tyrant. In the English Revolution of 1688 by William III., many of these Huguenots played an active and prominent part. To Holland the inauguration of the new era in England did not mean peace, but it meant an honourable alliance and security from further encroachments of the French king. The Dutch troops fought bravely in the battles of England, even after William's death in 1702; and Ramillies, Oudenarde, and Malplaquet, which saw Louis's greatest humiliation, were as much Dutch victories as La Hogue was an English victory.

The peace of Utrecht, in 1713, marks the close of Holland's activity as a great power in Europe. For her the 18th century was the century of demoralisation and decay. After William's death she became a republic once more; the stadthoudership was re-established in 1747, but it made no difference in the downward course. The National Convention of France having declared war against Great Britain and the stadthouder of Holland in 1793, French armies overran Belgium (1794); they were welcomed by the so-called patriots of the United Provinces, and William V. and his family (January 1795) were obliged to escape from Scheveningen to England in a fishing-smack, and the French rule began. The United Provinces now became the Batavian Republic, paying eight and a half millions sterling for a French army of 25,000 men, besides giving up important parts of the country along the Belgian frontier. After several changes Louis Bonaparte, 5th June 1806, was appointed king of Holland, but, four years later, was obliged to resign because he refused to be a mere tool in the hands of the French emperor. Holland was then added to the empire, and formed into seven departments. The fall of Napoleon I. and the dismemberment of the French empire led to the recall of the Orange family and the formation of the southern and northern provinces into the ill-managed kingdom of the Netherlands, which in 1830 was broken up by the secession of Belgium (q.v.). In 1839 peace was finally concluded with Belgium; but almost immediately after national discontent with the government showed itself, and William I. in 1840 abdicated in favour of his son. Holland being moved by the revolutionary fever of 1848, King William II. granted a new constitution, according to which new chambers

were chosen, but they had scarcely met when he died, March 1849, and William III. (born 1817) ascended the throne.

The bill for the emancipation of the slaves in the Dutch West Indian possessions, passed in 1862, decreed a compensation for each slave, and came into force in 1863. The expenses of this emancipation came to £1,065,366, and the number of slaves set free was about 42,000, of whom 35,000 were in Dutch Guiana.

In 1863 the naval powers bought up the right of the king of Holland to levy toll on vessels navigating the river Scheldt (q.v.), the king of Belgium binding himself also to reduce the harbour, pilot, and other charges on shipping within that kingdom. In 1868 the Luxemburg (q.v.) question was settled in a manner satisfactory to Holland. Next year capital punishment was abolished. In 1872 a new treaty with England, defining and limiting the sphere of influence and action of Britain and Holland in the Indian Archipelago, and removing the restrictions of the treaty of 1824 as to Sumatra, was followed by a war with Atchin, until then an independent Malay state in North Sumatra (see ATCHIN), a war that severely taxed the military and financial resources of the Dutch-Indian government, and was carried on, in a modified form, till 1908, the so-called conquest of 1873-75 notwithstanding. William III. having no living male issue, the succession to the crown was vested in the Princess of Orange, Wilhelmina, the only child of the king's second marriage, born in 1880. For many years the great question of internal politics was the new constitution, which, promulgated 30th November 1887, increased the electorate of Holland by no less than 200,000 voters. On the death of the king (23d November 1890), when Luxemburg ceased to be connected with the crown of Holland, the Princess Wilhelmina became queen. In 1898 a Peace Conference was held at The Hague, and an international arbitration tribunal established there (see PEACE); and in 1921 the League of Nations set up its Permanent Court of International Justice in the same city. In the Great European War Holland succeeded in maintaining neutrality, as she had done in the Boer war, though the strain, political and economic, was severe. The deposed Kaiser William took refuge in Dutch territory in 1918. Questions that have held the attention of the nation of late years have been the reform of the constitution (1917, 1919, 1922), armaments, colonial government, denominational schools, and the demands of Belgium in matters of territory and waterways.

Language and Literature.—Dutch is an essential link in the chain of Teutonic languages, a wonderful storehouse of old and expressive Germanic words and phrases. It has been said, with a little exaggeration, that Old English is Dutch, and to no other nation is the study of the Netherlandish more interesting than to the English. Without a knowledge of Dutch it is almost impossible properly to understand the historical development of English. For the relation of Dutch and Low German to High German, see the article on GERMANY; but between modern High German and modern Dutch there is less similarity in vocabulary than between modern English and modern Netherlandish, although the pronunciation differs much more in the latter case. Three great periods of development must be distinguished in the Netherlandish language, as in the German; the first was the period of inception, or of Old Netherlandish, when doubtless various Teutonic dialects existed among the tribes and peoples that had penetrated westward from the Elbe and the Oder. A curious relic of this ancient Netherlandish exists in a fragmentary translation of the Psalms, dating from the 9th century. It

does not seem to belong to any one language, but looks like an attempt at combining the dialects then existing. The second period comprises the Middle Netherlandish, which developed soon after the 11th century, and became the popular tongue of a very considerable area, spreading far beyond the Rhine in the east, and covering not only the greater part of Belgium, as it now exists, but also the northern portions of France, where Old Dutch persists to this very day in the villages, with the wondrous tenacity of popular tongues. The second period is rich in *fabliaux* and romances of chivalry, but these were nearly all of foreign origin, mostly French and some English. Among them we name *Fergut*, *Roman van Lancelot*, *Walewein*, *Floris en Blancefloer*. *Reinart* (see REYNARD THE FOX) is a truly national epic of considerable importance. But the most prominent representatives of Middle Netherlandish literature are Jakob van Maerlant (13th century) and Jan Boendale (14th century). The former was the author of the famous *Spiegel Historiel*; the latter wrote didactic poems, the best known of which is *Der Leken Spiegel*. To this period also belong Jan van Heelu's description of the battle of Woeringen and Melis Stoke's chronicles of Holland.

The origin of new Netherlandish or Dutch is to be found with the *Riederijckers*, whose rise can be traced to the commencement of the 15th century. They were mainly lovers of letters and the theatrical art, banded together in *Kamers*, 'chambers,' or clubs, for the purpose of study and mental recreation. In the course of time, when the troubles with Spain arose, these clubs no doubt also became centres of political agitation, and this led to their suppression in the southern provinces; but in the north, as soon as political freedom had been attained, they developed into literary associations of considerable importance. The most famous was the 'chamber' called *In Liefde Bloeiende* ('thriving in love') at Amsterdam, to which Coornhert (1522-90), Spiegel (1549-1612), and Roemer Vischer (1547-1620) belonged, the latter a literary merchant, and the father of two ladies who became celebrated for their learning amongst the men of letters of that period. Coornhert, Spiegel, and Vischer in 1584 caused a Dutch grammar to be published, and this may be called the foundation-stone of modern Netherlandish. Hooft (1581-1647) was the first to recognise the worth of his mother-tongue and to write a classical Dutch in which he strove to eliminate as much as possible all foreign elements, although a great admirer of classical lore and foreign literature, especially French and Italian. At Muiden he formed a literary club which exercised very great influence. Hooft wrote his *Historien*, but he also excelled in poetry and in the drama. Among his famous contemporaries is Vondel (1587-1679), who is considered the greatest of Holland's poets, and who, indeed, soars high in his dramas, still performed before appreciative audiences in our days. Milton, it is said, borrowed from Vondel, and passages taken from the masterpieces of the two poets certainly bear a curious resemblance. Vondel, some of whose dramatic works have been translated into German and English, was a very prolific poet. Yet his poetry can hardly be called so popular as that of Jacob Cats (1577-1660), whose maxims were for a long time, with the Bible, the only book found in every cottage. Cats is witty, but coarse; and Bredero, whose comedies deserve mention, is scarcely better in this respect. Van der Goes, who composed a beautiful poem on Amsterdam, ranks among the best of Vondel's disciples (1647-84); Oudaaen (1628-92) is noted for his political poems and his dramas; Constantyn Huyghens, the father of the great mathematician, for his epigrams

and his didactic poetry (the *Korenbloemen*, 'corn-flowers,' is still read and admired); and Brandt, for his historical writings.

This is the great period of literary activity in Holland previous to the revival which marked the end of the 18th century. Writers who were desirous of being read beyond the limits of their vernacular had to use Latin; and Erasmus, Boerhaave, Grotius, Spinoza, to mention only a few of the most famous, would scarcely have been so well known had they written exclusively in the language of Vondel.

The 18th century is the period also of literary decadence in Holland; the only great names are those of Feith and Bilderdijk (1756-1831). The latter wrote poetry such as has not been equalled since in the Dutch language, and it is a national loss that his great epic poem, *The Destruction of the First World*, remained unfinished. Bilderdijk also ranks high as a historian, and his philological studies deserve credit, though his learning was sometimes misled by his ingenuity. Among Bilderdijk's contemporaries are Helmers, whose patriotic songs against the French created in Holland as profound a sensation as Körner's in Germany, and the two literary ladies, Deken and Bekker, whose novels, written in conjunction, are true pictures of Dutch life in those days. The poems of Tollens (1780-1856) came later, and still retain their hold on the popular fancy (especially in the words of the national hymn) notwithstanding the appearance of numerous more modern competitors, among whom we may mention here Van Beers, Beets, Da Costa, Schimmel, Hofdijk, and J. van Lennep. Schimmel is also noted for his dramas and historical romances, the plots whereof he loves to place in England when not in Holland. Beets has been truly called the Charles Dickens of the Dutch, as his inimitable *Camera Obscura* (sketches of Dutch life) proves. These two authors are not unknown in England and America, as portions of their work have been translated. So have some of the stirring novels of Van Lennep. Hofdijk, who died in 1888, is known for his faithful and eloquent historical writings not less than for his lyrical poetry. Potgieter, Ter Haar, Heye, Ten Kate, and many others each excelled in a particular branch of poetry. A new period in Dutch literature comes in the eighties, beginning with Jacques Perk and Marcellus Emants. Other poets of this time are Willem Kloos, Helene Swarth, Herman Gorter, Frederik van Eeden, and Albert Verwey. In these the influence of Keats and Shelley is strong, as is that of French naturalism. Meanwhile Belgium produced Guido Gezelle and Pol de Mont. Many of the poets of the time were also novelists and critics, finding an outlet in *De Nieuwe Gids*. Among noteworthy novelists we must mention Hendrik Conscience, 'Miss Wallis' (a daughter of Dr Opzoomer), and Mrs Bosboom Toussaint; and we must pay a tribute to the undoubted gifts of 'Multatuli' (Douwes Dekker), whose *Max Havelaar* has been translated into nearly every European language. Most notable among recent Dutch novelists is Louis Couperus (q.v.). The Fleming Streuvels also deserves attention. Many of the generation of poets that succeeded the *Nieuwe Gids* movement—as Van Scheltema and Henriette Roland Holst—are much interested in socialist ideals.

In this necessarily rapid sketch we have made no distinction between Dutch writers in Belgium and Dutch writers in Holland. In fact, there is no distinction; for though Cape Dutch differs considerably from the European language, and the Dutch of the West Indies is much debased and mixed, Flemings and Hollanders express their

thoughts in the same language. The words 'Flemish' and 'Flemlander' have been invented by the French, and only serve to obscure what is a fact—viz. that there never has been a greater difference between the Dutch as taught at Antwerp and the Dutch as taught in Amsterdam than between Boston, Edinburgh, and Manchester English. There have been slight varieties in the spelling; but these have disappeared since the orthography of 1864 has been adopted in both the north and the south. This is perfectly well understood in the two countries themselves, where Dutch philological and literary congresses are annually held in a northern and a southern centre by turns. In Belgium there are more Dutch than Walloons, and the Belgian constitution does not recognise a preponderating French language. No doubt the Dutch Belgians have only latterly insisted upon the maintenance of their rights in this respect; but ever since the so-called 'Flemish movement' commenced they have steadily gained ground, and all the French encroachments are being swept away. Dutch is being taught everywhere in the schools, and a knowledge of Dutch is essential in many functions, for which King Leopold II. was taught Netherlandish by the great novelist Hendrik Conscience. The latter was one of the prime movers in the Dutch reaction in Belgium, where—with the names of Willems, Blommaert, Snellaert, Snieders, Hiel, Van Beers, &c., will for ever remain associated—some as fiery poets, some as noted prose-writers.

For general descriptions and travel, see the works of Montégut, Esquiro, Henri Havard, D'Amicus, Meldrum, and Beatrix Jungmann (well illustrated by Nico Jungmann, 1904); *A General View of the Netherlands* (Hague, 1915); the Foreign Office Handbook, No. 25 (1920). For history, the writings of Prescott, Motley, Thorold Rogers, Wagenaar, the very valuable collections of Gachard and Groen, the histories of Th. Juste, Bilderdijk, Fruin, Arend, Nuijens, Hofdijk, P. J. Blok (trans. 1899 *et seq.*), and Edmundson (1922), should be consulted. For literary history, see Dutch works by J. Ten Brink (1877), Jonckbloet (1873), Van Vloten (1879), Kloos (1904-14), Verwey (1914); English by De Meester (1915). For the history of art in the Low Countries, see the article PAINTING, the articles on the Dutch and Flemish painters there named, the works there cited, as also Kugler's handbook of the *German, Flemish, and Dutch Schools* (1898). See Martin Conway, *Early Flemish Artists* (1887); Fromentin, *Les Maitres d'Autrefois* (trans. 1913); Wauters, *La Peinture Flamande* (1884); Van Dyke, *Old Dutch and Flemish Masters* (1896).

Holland, in contradistinction to the kingdom of that name, is the oldest, wealthiest, and most populated part thereof, forming two provinces, North and South Holland. The province of North Holland has an area of 1070 sq. m., and a population of 1,300,000. It comprises the peninsula to the west of the Zuider Zee, and also the islands that fringe this great gulf on its northern side. To the west North Holland is bounded by the German Ocean, and to the south by the province of South Holland. This latter province has an area of 1160 sq. m., lying between the German Ocean and the provinces of Zeeland, Utrecht, and North Brabant. It had a population of 1,700,000. The population of North and South Holland is largely agricultural. It is in these provinces that the best corn is grown, the best cattle reared, and the best dairy produce brought to market. But as the largest towns of the kingdom (Amsterdam, Rotterdam, and The Hague) are also situated in the two provinces, its chief trade and industries, with nearly the whole of its shipping, are carried on in them.

Holland, originally a fine kind of linen manu-

factured in the Netherlands, and now a coarse linen fabric, unbleached or dyed brown, which is used for covering furniture, &c.

Holland, PARTS OF. See LINCOLNSHIRE.

Holland, LORD. HENRY RICHARD VASSALL FOX, third Baron Holland, F.R.S., was born at Winterslow House, Wilt., in 1773, and succeeded to the title on the death of his father, the second baron, in 1774. He went to Eton, and thence to Christ Church. He was trained for public life by his celebrated uncle, Charles James Fox, after whose death he held the post of Lord Privy Seal in the Grenville ministry for a few months. He then shared the long banishment of the Whigs from the councils of their sovereign. During this long and dreary interval Holland, to use the language of Macaulay, was the 'constant protector of all oppressed races and persecuted sects.' He held unpopular opinions on the war with France; strove zealously to mitigate the severity of the criminal code; made war on the slave-trade; threw his heart into the struggle against the Corn Laws; and, although an aristocrat, laboured to extend the liberties of the subject. In 1830 he became Chancellor of the Duchy of Lancaster and a member of the reform cabinet of Earl Grey, and these posts he also held in the Melbourne ministry. He died at Holland House, Kensington, October 22, 1840. He wrote biographies of Guillen de Castro and Lope de Vega, translated Spanish comedies, prepared a life of his uncle, and edited the memoirs of Lord Waldegrave.—His wife, ELIZABETH VASSALL (1770-1845), daughter of a wealthy Jamaica planter, married in 1786 Sir Godfrey Webster; but the marriage was dissolved in 1797 for her adultery with Lord Holland, who immediately married her. She was distinguished for beauty, conversational gifts, and autocratic ways; and till the end of her life her house was a meeting-place for brilliant wits and distinguished statesmen.—Their son, the fourth Lord Holland (1802-59), edited his father's *Foreign Reminiscences* (1850) and *Memoirs of the Whig Party* (1854); and Lord Ilchester (Lord Stavordale) published a continuation of the latter, *Further Memoirs of the Whig Party* (1905), as well as the journals of Lady Holland (1908), and the fourth Lord Holland (1924) and a Life of the first lord (1920). The 'Pope' of *Holland House* (the letters of John Whishaw, ed. Lady Seymour, with a Life by W. P. Courtney, 1906), threw much new light on Lady Holland's circle. See the Princess Marie Lichtenstein's *Holland House* (1873), and Lloyd Sanders, *The Holland House Circle* (1908). For Holland House itself, see also ELIZABETHAN ARCHITECTURE, KENSINGTON.

Holland, SIR HENRY, physician, was born at Knutsford, Cheshire, on 27th October 1788, studied at Edinburgh, wrote a book on his three years' *Travels in Albania, Thessaly, &c.*, and settled in London in 1816. Physician-in-ordinary to the Prince Consort (1840), and to the Queen (1852), he was in 1853 created a baronet. His *Medical Notes* (1839) passed through several editions. In 1852 appeared *Chapters on Mental Physiology*, which are expansions of those essays in his former work which treated of 'that particular part of human physiology which comprises the reciprocal actions and relations of mental and bodily phenomena.' Other books from his pen are *Essays on Scientific Subjects* (1862) and *Recollections of Past Life* (1871). Holland died at London, 27th October 1873. He was related in different degrees to Josiah Wedgwood, Mrs Gaskell, and Charles Darwin, and married for his second wife a daughter of Sydney Smith. See KNUTSFORD.

Holland, HENRY SCOTT (1847-1918), preacher and theologian, was born at Ledbury, in Herefordshire, and educated at Eton and Balliol. He took first-class honours in 1870, and, after having been theological tutor at Christchurch and select preacher, he became canon of Truro in 1882, of St Paul's in 1884, and of Christchurch in 1910, Regius Professor of Divinity at Oxford in 1911. He published some remarkable volumes of sermons, &c. See his *Memoirs and Letters* (ed. Paget, 1921).

Holland, JOSIAH GILBERT, an American author, was born in Belchertown, Massachusetts, 24th July 1819, and graduated at the Berkshire medical college, at Pittsfield, in 1844. He soon abandoned his profession, however, and after fifteen months as a school superintendent at Richmond, Virginia, became assistant editor of the Springfield *Republican*, of which he was part-proprietor also from 1851 to 1866. In 1870, with Roswell Smith and the Scribners, he founded *Scribner's Monthly*, which he conducted successfully till his death, 12th October 1881. In this magazine appeared his novels, *Arthur Bonnicastle* (1873), *The Story of Sevenoaks* (1875), and *Nicholas Min-turn* (1876). His *Timothy Titcomb's Letters* (1858) went through nine editions in a few months; and this sale was exceeded by his *Life of Lincoln* and his most popular poems, *Bitter Sweet* (1858), *Kathrina* (1867), and *The Mistress of the Manse* (1874). See the *Life* by Mrs Plunkett (1894).

Holland, PHILEMON, styled 'the translator-general of his age,' was born at Chelmsford, in Essex, in 1552. He became a Fellow of Trinity College, Cambridge, and in 1591 took at an unknown university the degree of M.D. He afterwards practised medicine at Coventry, and in 1628 was appointed head-master of the free school there. He died on 9th February 1637. His more notable translations were Livy, Pliny's *Natural History*, Suetonius, Plutarch's *Morals*, Ammianus Marcellinus, Xenophon's *Cyropædia*, and Camden's *Britannia*; see Whibley's introduction to the 'Tudor Series' reprint (1899). His son Henry (1583-c. 1650), bookseller in London, published *Herologia Anglica* (1620).

Hollands. See GIN.

Hollar, WENCESLAUS (1607-77), Bohemian etcher. See ENGRAVING; and a book by A. H. Hind (1922).

Holles, DENZIL, LORD, one of the 'five members,' was the son of the Earl of Clare, and was born at Houghton, in Nottinghamshire, in 1599. He entered parliament in 1624, and at once joined the party opposed to the king's government. On March 2, 1629, he was one of the members who held the Speaker in his chair whilst resolutions were passed against Arminianism and tonnage and poundage. For this act he was condemned by the Court of King's Bench to pay a fine of one thousand marks, and to be imprisoned in the Tower during the king's pleasure; he remained there about a twelvemonth. He was one of the members of parliament whom Charles accused of high-treason and attempted to arrest in 1642. On the outbreak of the Civil War he was charged to hold Bristol; but, dreading the supremacy of the army more than he dreaded the pretensions of the king, Holles was a steady advocate of peace. He was a foremost leader of the Presbyterian party. For having in 1647 proposed to disband the army he was accused of high treason; but, leaving his native land, he found refuge in Normandy. Again, after a brief return visit to England in the following year, he went back to Brittany, and stayed there until Cromwell's death. On his reappearance in England Holles set to work to effect the restoration of the Stuarts; he was the

spokesman of the commission delegated to carry the invitation of recall to Charles II. at Breda. In 1661 he was created a peer as Lord Holles of Ifield in Sussex. His last important public duty was the negotiation of the treaty of Breda in 1667. Although thus employed in the service of the crown, Holles still clung faithfully to his love of liberty, and remained staunch in his support of the governing rights of parliament; and as Charles's propensities towards absolutism became more pronounced Holles leaned more to the opposition. He died on 17th February 1680, a man of firm integrity, a lover of his country and of liberty, 'a man of great courage and of as great pride. He had the soul of an old stubborn Roman in him.' See *Memoirs* written by himself (1699); also S. R. Gardiner's *History*.

Holloway, a district of London, in the metropolitan and parliamentary borough of Islington, on the N.

Holloway College, situated at Mount Lee, Egham, Surrey, near Virginia Water, is an institution founded in 1883 by Thomas Holloway (1800-83), patentee of Holloway's pills and Holloway's ointment (see ADVERTISING), for the purpose of supplying a suitable education to women of the middle classes. The building, in the French Renaissance style, was opened in 1886. The college is a school of London University in the faculties of art and science. Holloway also founded a sanatorium or hospital for the mentally afflicted belonging to the middle classes.

Holly (*Ilex*), a genus of trees and shrubs of the natural order Aquifoliaceæ, chiefly natives of temperate climates; with evergreen, leathery, shining, and generally spinous leaves; small flowers

Branch of Common Holly
(*Ilex aquifolium*):
a, a flower.

which have a four- to five-toothed calyx, a wheel-shaped four- to five-cleft corolla, four or five stamens, and the fruit globose and fleshy, with four or five stones (*nuts*). The Common Holly (*I. aquifolium*), the only European species, and a native also of some parts of Asia, is a well-known ornament of woods, parks, and shrubberies in Britain, the stiffness of its habit being so compensated by the abundance of its branchlets and leaves as to make it one of the most beautiful evergreens. It is found as a native plant in Scotland, although Britain is nearly its northern limit; and

it attains a greater size and displays greater luxuriance in the northern than in the southern parts of its geographic range, often appearing in the former as a tree of considerable size, 20 to 50 feet high, whilst in the latter it is generally a mere bush. It prefers light soils. There are numerous varieties of holly produced, or at least perpetuated, by cultivation, exhibiting great diversity in the leaves, of which the *Hedgehog Holly* may be mentioned as extremely sinuous and spinous, whilst others are prized for their colour, golden, silver-blotched, &c. The flowers of the common holly are whitish, axillary, nearly

umbellate, and often dicecious by abortion of the pistil; hence the barrenness of certain varieties, and occasionally also of individual trees of others which are remarkable for having the stamens only or the pistils only perfect as the case may be; the former of course never bear fruit. The fruit is small, scarlet, rarely yellow or white. The abundance of the fruit adds much to the ornamental character of the tree in winter, and affords food for birds: but to man it is purgative, emetic, and diuretic, and in larger quantities poisonous. The leaves are inodorous, have a mucilaginous bitter and somewhat austere taste, and have been used medicinally in cases of gout and rheumatism, as a diaphoretic, and also as an astringent and tonic to correct a tendency to diarrhoea, &c. The leaves and small branches, chopped, are sometimes used for feeding sheep in severe winters. The root and bark are emollient, expectorant, and diuretic. Birdlime (q.v.) may be made from the inner bark. The wood is almost as white as ivory, very hard and fine-grained, and is used by cabinetmakers, turners, musical-instrument makers, &c., and sometimes for wood-engraving. Handles of tools and handles of metal teapots are very often made of it. The holly is often planted for hedges, as it bears clipping well, and makes an excellent fence. A holly hedge may either be kept low, or, as is the case at Tynningham, in East Lothian, allowed to grow to the height of 20 or 30 feet. In the gardening of former days hollies were often clipped into fantastic shapes. The name holly used to be derived from the very ancient use of the branches and berries to decorate churches at Christmas (said to be connected originally with the Roman Saturnalia), from which the tree was called Holy Tree. Really holly (*O. E. holyn*) shows the same root as in Irish *cuilean*, German *hulze*, Old French *houle* (see EVERGREENS, and the illustration there). The American holly (*I. opaca*) is common along the Atlantic coast from Maine southwards.—Maté (q.v.), or *Paraguay Tea*, is the leaf of a South American species of holly (*I. paraguayensis*). *I. vomitoria* has been erroneously named *South Sea Tea*, from the impression that it was the same as *I. paraguayensis*. The Indians smoked it as a substitute for tobacco. *I. Cassine* and *I. Dahoon* are natives of the same region of the United States. *I. gongonha*, which grows in the provinces of Minas Geraes and São Paulo, Brazil, has leaves which have been substituted for *Paraguay Tea*. The fruit of *I. macrocarpa* contains a great quantity of tannin, and mixed with a ferruginous earth is used to dye cotton.

According to the Darwinian theory of the origin of thorns, spines, and prickles, these structures serve either as a protection against the attacks of the larger animals (the view expressed in Southey's 'Holly-tree') or as climbing organs. The ancestors of the holly are supposed to have had spineless leaves which were eaten by large browsing animals, and thus the holly ran the risk of extermination, until some individuals, dwarfed and checked in growth from the losing of their tender shoots, developed spines which protected them from the attacks of animals. These spine-producing hollies had an advantage over their spineless neighbours and became the survivors. In support of this theory is the fact that many varieties of holly above a certain height develop leaves without spines; and this is explained by saying that these leaves were beyond the reach of animals which attacked the plant, and therefore spines were not formed on these higher leaves because they were unnecessary. A more recent view of the origin of spines denies altogether the agency of animals. According to this view the bitter nature of holly leaves is sufficient to repel any animal from making food of them. The pres-

ence or absence of spines on the leaves is the result of the metabolism of the plant. Those plants which have grown in rich soil under favourable climatic conditions are vigorous individuals with large spineless leaves; while hollies which have grown in poor soil under unfavourable conditions have shrubby stems and small curled spiny leaves. The former plants are healthy and well fed; the latter half starved and ill conditioned. The former are the highly anabolic, the latter the katabolic individuals.

Hollyhock (*Althæa rosea*), a plant of the natural order Malvaceæ, commonly referred to the same genus with the Marsh Mallow (q.v.). It has a tall, straight, hairy stem; heart-shaped, crenate, wrinkled, five- to seven-angled leaves, and large

Hollyhock (*Althæa rosea*).

axillary flowers, almost without stalks; the leaves diminishing into bracts, and the upper part of the stem forming a spike; the petals hairy at the base. The hollyhock is a native of the Mediterranean, is to be seen in almost every garden in India, and has been much cultivated in gardens in Britain from a very early period. At present it is a favourite flower, and varieties, the result of cultivation, are very numerous. It varies much in the colour of the flowers, and double and semi-double varieties are common. It is an autumnal flower, continuing till the frost sets in. The plant is a biennial or perennial, but in the latter condition lasting only for three or four years in a healthy state. The stem rises to a height of 8-15 feet, unbranching, or nearly so. Since 1870-75 the plant has all but succumbed to what is known as the hollyhock disease, caused by a species of fungus (*Puccinia*) which attacks the leaves and finally proves fatal, unless prompt measures are adopted to arrest its progress. Sulphur dusted on the affected leaves has proved the most effectual cure. The fibres of the plant have been made into yarn, but it is not yet certain if it is really valuable for cultivation on this account, or for the manufacture of paper. It is not improbable that it might be cultivated with advantage to afford green fodder for cattle, which are very fond of its leaves, and the leaves are produced in great abundance if the plant is prevented from flowering. The flowers are mucilaginous and demulcent, and are sometimes used like those of mallows and marsh mallows. The leaves yield a fine blue dye.—The Chinese Hollyhock (*A. chinensis*) is an allied species.

Holman, JAMES, 'the Blind Traveller,' was born 15th October 1786, and, entering the navy in 1798, had risen to be a lieutenant when, in 1810, the loss of sight compelled him to quit the service. Yet, being of an active temperament, he in 1819-21 travelled through France, Italy, and the countries touching on the Rhine. Encouraged by this, he conceived the plan of travelling round the world, and had penetrated to Irkutsk in Siberia, when he

was arrested as a spy by the Russian government and carried back to the frontiers of Poland. Nevertheless, undaunted by this failure, he again set off in 1827, and this time effectively accomplished his purpose. Finally, he visited the countries of south-east Europe. He died at London, 29th July 1857. He published *Journals* of his successive journeys, which contain much more useful information than could be expected from the circumstances under which it was gathered.

Holmberg, WERNER, Finnish landscape painter, was born in 1830, and studied at Düsseldorf, the principles of that school becoming through him ingrained for years in Finland's art. His works conjure up the whole poetic charm of his native country, and he is the first Finnish painter who can be judged according to European standards. He died in 1860.

Holmby House, a fine Tudor mansion, $\frac{6}{8}$ miles NW. of Northampton, was built by Sir Christopher Hatton in the reign of Elizabeth. It was sold to James I., and was for four months in 1647 the prison of Charles I. (q.v.). It was dismantled in 1652.

Holmes, OLIVER WENDELL, born in Cambridge, Massachusetts, 29th August 1809, was the son of Abiel and Sarah (Wendell) Holmes. His father was a Calvinistic Congregational minister, author of *Annals of America* and some poetry; his humour he inherited from his mother, who, descended from a Dutch ancestor, was related to many well-known families in New England and New York. He entered Harvard College at the age of sixteen, and graduated, in what became a famous class, in 1829. He began the study of law, but after a year gave it up, and entered upon the study of medicine. After the customary course at the medical school of Harvard he spent over two years in the hospitals and schools of Europe, chiefly in Paris; and on his return home took the degree of M.D. in 1836. Three years later he was professor of Anatomy and Physiology at Dartmouth College, but after two years' service he resigned and engaged in general practice in Boston. He married in 1840 Amelia Lee Jackson, daughter of a justice of the Supreme Court of Massachusetts. (Three children were born of the marriage, of whom one, O. W. Holmes, jun., served as a captain in the civil war, and is a judge and an eminent writer upon legal subjects.) In 1847 he was appointed professor of Anatomy at Harvard, which place he held until 1882. He was highly respected as a man of science, and beloved as an instructor; but as time went on his literary genius quite overbore his professional zeal, and it is as a poet and essayist that he will be remembered.

He began writing verse while an undergraduate, but his first efforts were not remarkable. While in the law school he contributed to the *Collegian* a few poems of a light and humorous character which first gave indications of his future power; among these are 'Evening, by a Tailor' and 'The Height of the Ridiculous.' There is a reminiscence of his life in Paris in the tender poem beginning 'Ah, Clemence! when I saw thee last.' A little later was written 'The Last Leaf,' which contains one perfect stanza, and which from the blending of quaintness and pathos is perhaps the most fortunate and characteristic of his minor poems. For some years the muse visited him by stealth, the votary fearing for his professional reputation in a town so noted for propriety. A small volume of these early poems was published in 1836. Twenty years passed with desultory efforts and a slowly-growing power, when by the publication of *The Autocrat of the Breakfast Table* (1857-58) he became suddenly famous. No literary event since the *Noctes* had more strongly affected the reading world. The success was due

to its fresh, unconventional tone, its playful wit and wisdom, and to the lovely vignettes of verse. Apart from the merits of thought and style, the pages have the charm of personal confidences; the reader becomes at once a pupil and an intimate friend. The tone assumed is egotistical, but the force and the comedy (as every man with imagination sees) are bound up in that assumption. *The Professor at the Breakfast Table* (1858-59) was written upon the same lines and has qualities equal to those of its predecessor, but it deals with deeper questions and in a less familiar way. *The Poet at the Breakfast Table* (1872) takes the reader into the region of religious and philosophical ideas. 'God is Love' is the keynote of its doctrine. His first effort in fiction was *Elsie Venner* (1859-60), a study of hereditary impressions and tendencies. *The Guardian Angel* (1867) is a picture of rural New England. *A Mortal Antipathy* was written in 1865. It is scarcely a novel as the term is generally understood, but there is a thread of story on which the author hangs his observations, as he had done before in the *Autocrat*. The introduction to this book is autobiographical and historical, and gives a delightful view of Cambridge as it was in the author's boyhood, and a sadly amusing account of early American literature. The works before named appeared in the *Atlantic Monthly*, of which he was one of the founders. He wrote for it also many occasional essays and poems. Besides the early volume (1836), he published *Songs in Many Keys* (1862), *Songs of Many Seasons* (1875), *The Iron Gate* (1880), and *Before the Curfew* (1888). His other (prose) works are *Currents and Counter-currents* (1861), *Soundings from the Atlantic* (1864), *Border Lines of Knowledge* (1862), *Mechanism in Thought and Morals* (1871), and *Memoirs of Motley* (1879) and Emerson (1885). *Our Hundred Days in Europe* (1887) is an account of a visit made in 1886, during which he received honours from the universities of Cambridge, Oxford, and Edinburgh. The article EMERSON in this work is from his pen. Universally beloved, he died peacefully in his armchair in his library overlooking Cambridge, on the 7th October 1894.

It is difficult to make a summary of the traits of a writer so versatile. By his own generation he will be remembered as a great talker, in the highest sense. His intellect was keen and powerful; his observation instinctive; and his enthusiasm and energy would have carried through a man of less brilliant parts. His verse is melodious, compact, and rounded by art; its Gallic liveliness tempered by the even measure, and enforced by the point, of the 18th century. There is not in it a trace of the manner of recent English poets. Still, in its thought, its humanity, and its suggestions of science, it is seen that he is a man of his own century, and among the most advanced. Among specimens of his varied powers may be cited 'The Last Leaf,' already mentioned, 'The Chambered Nautilus,' 'Grandmother's Story' (of the battle of Bunker's Hill), 'Sun and Shadow,' 'For the Burns Centennial,' 'On lending a Punch-bowl,' and 'The One-hoss Shay.' He is especially happy in his tributes to brother poets—as to Longfellow and Lowell, and to Whittier on his seventieth birthday. During the civil war he wrote many impassioned lyrics in defence of the Union—probably the best patriotic songs of the time. Of his prose it may be said that, whatever may be the subject, it always engages attention, and is always *sui generis*. The reader feels himself in contact with a strong mind, full of the fruit of reading, and with a character that is full of surprises. The choice of words is directed by a poet's inevitable instinct, and the general treatment is both precise and delicate. In the essay upon *Mechanism in Thought and Morals* there is an

acuteness and subtlety which might have made a metaphysician; only that might have deprived the world of one of its most original and delightful essayists. There are degrees of value in his works, but it appears that his fame will rest chiefly upon *The Autocrat*, *The Professor*, and certain of his poems. Of his writings in general it should be said that, though his sparkling wit and flowing humour are evident to the most casual reader, a closer study reveals other qualities which give him a place among the great writers of the time.

The collected ('Riverside') edition of his works extends to 13 vols. (1891-92). There are Lives by W. S. Kennedy (1883), Emma E. Brown (1884), J. T. Morse, jun (2 vols. 1896), and Townsend (1909).

Holofernes. See JUDITH.

Holograph. See DEED.

Holoptychius (Gr. *holos*, 'all,' and *ptychē*, 'wrinkle'), a genus of fishes of the order Crossopterygia from Devonian and Old Red Sandstone strata of North America and Europe, in which the scales show superficial wrinkles, and the teeth a complicated labyrinthine internal pattern.

Holothurians (*Holothuriodea*), a class of animals belonging to the sub-kingdom Echinodermata (q.v.), from the other members of which they are readily distinguished by a more or less worm-like appearance. They are popularly known as Sea-cucumbers or Sea-slugs. The word *holothurion* was used by Aristotle for a marine animal which we are now unable to identify, and the Latinised form was appropriated as a generic title by Linnaeus in 1758. His genus was practically co-extensive with the present class. As in all Echinodermata, the symmetry of the adult body is apparently pentagonal, but, instead of presenting the appearance of rays diverging in one plane from a common centre, these are bands running along the sides of a cylinder. Very frequently they are not equidistant from each other, and then the radiate symmetry passes over into a bilateral one. The most common arrangement is for three rays to be approximated to each other on the ventral and two on the dorsal aspect. The body of a Holothurian consists of a sac of leathery consistency (whence the name Scytodermata sometimes used for them), made up of a cuticle, layers of cells, connective tissue, nerve-fibres, and calcareous plates and muscles. The calcareous plates are the sole remnants of the skeleton which is so largely developed in other Echinoderms. They are of various shapes, resembling wheels in *Chirodota*, plates and anchors in *Synapta*, and spines in some other genera; in *Psolus* these are overlapping scales. The mouth is ordinarily at one end of the body, but occasionally on the ventral surface; it is surrounded by a ring of tentacles whose number is some multiple of five, and opens into a gullet surrounded by a circle of calcareous plates. The digestive tract is ordinarily disposed in a loop; the last portion before the vent (cloaca) is a large space, which has been observed to contract rhythmically. To it are appended (except in two subdivisions) a pair of branched outgrowths, the respiratory trees, and two short tubes (Cuvierian organs) which secrete mucus.

The gullet is surrounded by the ring-shaped central nervous system, and also by a tube belonging to the ambulacral or water-vascular system, which is so generally distributed among the Echinodermata. It gives off a branch forwards to each tentacle, and sends one backwards along each of the five radii of the body, to supply the tube-feet, the principal locomotor organs. The annular tube bears a reservoir, the Polian vesicle (often multiple), and gets a supply of water from the body-cavity by a stone-canal (also often multiple). The sense-

organs consist of auditory vesicles situated near the anterior end of the body, and containing small calcareous corpuscles (otoliths), and of the tentacles above mentioned. These may be either simple or

a, Semidiagrammatic view of the viscera of a Holothurian belonging to the Aspidochirota. Projecting from the upper end are the tentacles, lower down the calcareous ring, and still lower in the middle line the two Polian vesicles. The intestine is shown passing in a loop to the hinder end of the body; during part of its course it is seen to be attached to the body-wall by a mesentery. Two respiratory trees open into its expanded termination or cloaca, which is connected to the walls of the body by radiating muscular bands. Longitudinal muscles pass from the anterior to the posterior end of the animal. To the right is the branched genital gland with its duct (From Leunis)

b, *Phyllophorus urna*, one of the Dendrochirota, 1/4 nat. size (from Leunis); c, *Holothuria tubulosa*, one of the Aspidochirota, 1/4 nat. size (from Leunis); d, *Onesiphanta mitabalis*, one of the abyssal Elisipoda, 1/4 nat. size (from Thel); e, calcareous wheel, from the integument of *Chirodota purpurea*, magnified 100 diameters (from Thel); f, g, plate and anchor of *Synapta Besselii*, highly magnified (from Thel); h, larval form (*Auricularia*) of *Holothuria tubulosa*, highly magnified (from Selenka)

branched, and in a few cases they are furnished with suckers. In the Elisipoda tactile organs are present in the form of dorsal papillae.

The generative organs consist of a bunch of tubes, with one end closed; their duct opens either within or just outside the circle of tentacles. The egg develops as a rule into a curiously-formed bilaterally symmetrical larva, formerly described as a distinct animal under the name *Auricularia*. In a few cases the development is direct; in *Cucumaria crocea* the young are borne among the tentacles of the parent, whilst in *Psolus ephippifer* they are carried in a special pouch on the back.

The class is subdivided as follows:

I. ELISIPODA, primitive deep-sea forms, bilaterally symmetrical; tube-feet on the ventral surface, papillae on the dorsal. No respiratory trees. A very large number of genera and species have been obtained by the *Challenger* and other deep-sea expeditions.

II. PEDATA, with well-developed tube-feet and papillae.

(1) Aspidochirotae, with tentacles bearing a disc, and ten calcareous plates round the gullet. The genus *Holothuria* as now understood belongs here.
(2) Dendrochirotae, with arborescent tentacles
—e.g. *Cucumaria*, *Psolus*

III. APODA, devoid of tube-feet and papillae.

- (1) Pneumonophora, with respiratory trees—e.g. *Molpadia*. (2) Apneumona, with neither radial water-vascular canals, respiratory trees, nor Cuvierian organs—e.g. *Synapta*, *Chirodota*.

The Holothurians are all marine, and have a world-wide distribution; traces of them have been found fossil as far back as the Carboniferous deposits of Scotland. They either take in large quantities of sand and absorb the nutritive matters mixed with it, or devour small animals. On strong contraction, caused by sudden irritation, the whole digestive canal and its appendages are not unfrequently ejected; but these are regenerated after a time. In some species the cloaca is inhabited by a small commensal fish of the genus *Fierasfer*. *Trepang* (q.v.), or *bêche-de-mer*, a great delicacy among the Chinese, consists of dried Holothurians.

Holst, GUSTAV, English musical composer, was born at Cheltenham, 21st September 1874, of a musical stock, which had been resident for some time in England, and in which Swedish, Russian, and English blood was mingled. Educated at Cheltenham grammar school, he held a village organistship for a time, and had some experience of conducting before proceeding, having with difficulty procured a scholarship, to the Royal College of Music, London, where he became a pupil of Stanford and a friend of Vaughan Williams. He was intended for a pianist by his father, but neuritis and a predilection for composition determined otherwise. Meeting in the trombone the demand for self-expression in some instrument, he joined the orchestra of the Carl Rosa Opera Company, for whom he also acted as *répétiteur*, and was for a time engaged by the Scottish Orchestra. Thereafter he settled in London, becoming musical director at the Passmore Edward's Institute, playing the organ at Covent Garden, and finally obtaining two appointments which he held simultaneously, the one as musical director and teacher of composition at Morley College, the other as principal teacher of music at St Paul's Girls' School; for a time he also taught at University College, Reading, and in 1918 did educational work among the British troops in Salonika, Constantinople, and Asia Minor. Holst's works are choral, orchestral, and operatic, and in all he has achieved distinction. His earlier pieces, however, if pleasantly melodious, show no peculiar promise; amongst these, apart from the opera *Revoke* (1895), his first composition, are various orchestral works, as the well-known *Ballet Suite* (1900), the more advanced *Mystic Trumpeter* (1904), *Songs without Words* (1906), and, the outcome of the study of folk-song in Cecil Sharp and others, *Songs of the West* (1907) and *A Somerset Rhapsody* (1907), together with such choral pieces as *Ave Maria* (1900) and *King Estmere* (1903). For a period after 1907—from 1906, if one includes the hardly representative opera *Sita* with its subject taken from the *Rāmāyana*—Holst's growing powers found inspiration in Sanskrit literature in the *Rigveda*, in the epics *Rāmāyana* and *Mahābhārata*, and in the plays of Kālidāsa; here the chamber opera *Savitri* (1908) is strongly characteristic, as also the two series (1907, 1908–12) of settings of hymns from the *Rigveda*, in which last, as in the kindred *Eastern Pictures* (1911), is displayed a mastery of choral effect and a style unusual and uncompromisingly individual; the *Cloud Messenger* (1910), however, an ode for chorus and orchestra revealing the composer's melodic invention, his strongly accented rhythms, his penetration of a poetical subject, is the greatest achievement of the period. The orchestral composition *Beni Mora* (1910), containing 'In the Street of the Ouled Nails,' though a representation of the East in terms of music, was the outcome of Arabic, not of Sanskrit, influences. After the

Sanskrit period Holst's first important works, *Hecuba's Lament* (1911) and the *Hymn to Dionysus* (1913), were choral, though mention might be made of *Phantastes* (1911), a suite for orchestra closely associated with the spirit of Lewis Carroll. Onward from 1915 appeared works of outstanding significance, giving new rank to Holst as a composer; *The Planets* (1915–16), for orchestra, has been styled 'one of the most ambitious achievements in modern British music;' the *Hymn of Jesus* (1917), 'a masterly and skilfully designed work of startling originality and boldness;' the opera *The Perfect Fool* (1923, play as well as music by Holst), 'a great work of art.' Apart from these, the *Japanese Suite* (1916) for orchestra, *Four Songs* (1916) for voice and violin, *Six Choral Folk-songs* (1916), *Ode to Death* (1919, words by Whitman), *At the Boar's Head* (short opera, 1925) are noteworthy. Throughout his work Holst has been strong in his insistence that natural melody should take its course unrestricted by the conventions imposed in the course of musical history, and on that account has been set down as a revolutionary by some; even in his own case, however, the attainment of his ideal has been hampered by his folk song and oriental studies, and in other ways. The use of the pianoforte in musical education he has condemned.

Holstein, formerly a duchy belonging to Denmark, and at the same time a member of the Germanic Confederation, was annexed in 1866 to Prussia, which incorporated it in the province of Sleswick-Holstein. It is separated from Sleswick on the N. by the river Eider and the North Baltic Canal; is bounded on the E. by the Baltic Sea, Lubeck (Oldenburgish and free), and Lauenburg; on the S. by the Hamburg territory and the Elbe; and on the W. by the North Sea. One-eighth of the surface consists of marshes. The central districts are occupied by an undulating plain traversed from north to south by a low heathy and sandy ridge. The soil, with the exception of several tracts of sand and heath, is very fruitful, especially in the marshes. The climate and natural productions closely resemble those of similar districts in the north of Germany. Salt and gypsum are the only minerals found. Peat is plentiful. Agriculture and the rearing of cattle are the chief employments, though market-gardening flourishes in the neighbourhood of Altona, and shipping in the seaport towns, and fishing along the coasts, especially for oysters in the North Sea. Area, 3237 sq. m. The inhabitants are mostly Germans of the Low German stock. The history of Holstein will be noticed under SLESWICK-HOLSTEIN.

Holsten, KARL CHRISTIAN JOHANN, an eminent Protestant theologian, born at Güstrow in Mecklenburg-Schwerin, 31st March 1825. He studied theology and philology at Leipzig, Berlin, and Rostock, and became in 1852 a teacher at the Rostock gymnasium. In 1870 he was called to the Bern High School as an extra-ordinary professor, next year became ordinary professor, and in 1876 obeyed a call to a similar post at Heidelberg. His startling contribution to Pauline theology, *Zum Evangelium des Paulus und Petrus* (1867), was followed by *Das Evangelium des Paulus* (vol. i. 1880), *Die drei ursprünglichen, noch ungeschriebenen Evangelien* (1883), and *Die Synoptischen Evangelien nach der Form ihres Inhalts* (1886). He died 27th Jan. 1897.

Holt, SIR JOHN, Lord Chief-justice of the Court of King's Bench, was born at Thame in Oxfordshire, on 30th December 1642. After leading a wild life as a student of Oriel College, Oxford, he entered at Gray's Inn, reformed his manners, and was called to the bar in 1663. He figured as counsel in most of the state-trials of that period, and generally as pleader for the defendants. In 1686 he was made

recorder of London and king's serjeant, and was knighted. On the accession of William III he was raised to the dignity of lord chief-justice of the King's Bench, and filled the post to his life's end. He died 3d March 1710. Sir John Holt occupies an honourable place among the dignitaries of the English bench on two accounts. Contrary to the practice of his predecessors, he treated those who appeared before him with uniform fairness and justice. Although politically a Whig, Holt's judicial career was entirely free from the stigma of party bias or intrigue. He distinguished himself by his courageous defence of the powers of his office against both crown and parliament, and his decisions were marked by conspicuous ability and unbending integrity. See *Life* (1764) and *Reports of Cases determined by Sir John Holt from 1688 to 1710* (1738).

Holtzendorff, FRANZ VON (1829-89), a German writer on law subjects, was born at Vietmannsdorf in Brandenburg. Educated for the law, he practised in the courts at Berlin till 1857, when he became a lecturer on law at the university. Made professor there in 1861, he was in 1873 called to Munich. He is known as an author on several branches of law, and especially as an advocate for the reform of prisons and penal systems. Among his numerous works may be mentioned one on deportation, and another on the Irish prison system (1859); *Die Principien der Politik* (1869); *Encyclopädie der Rechtswissenschaft* (1870-71; 4th ed. 1882); *Handbuch des deutschen Strafrechts* (1871-77); and *Handbuch des Völkerrechts* (1885).

Holtzmann, ADOLF, a celebrated Germanist, was born at Karlsruhe, 2d May 1810, first studied theology at Berlin, then Old German philology under Schmeller at Munich, and next Sanskrit under Burnouf at Paris. In 1852 he was appointed professor of the German Language and Literature at Heidelberg, where he died, 3d July 1870. Among his numerous contributions to philology are *Ueber den griech. Ursprung des ind. Tierkreises* (1844); *Ind. Sagen* (1845-47); *Kelten und Germanen* (1855), in which both are maintained to have been originally identical; and *Untersuchungen über das Nibelungenlied* (1854), in which the views of Lachmann are assailed. His last work was a projected *Altdeutsche Grammatik*. After his death Holder edited from his papers *German. Altertümer* (1873), *Deutsche Mythologie* (1874), and *Die ältere Edda* (1875).—Of his brothers two attained eminence, Karl Heinrich Alexander (1811-65) as a lecturer and writer on applied mathematics; and Karl Julius (1804-77) as a preacher and ecclesiastic at Karlsruhe.

Holtzmann, HEINRICH JULIUS, an eminent theologian, was son of the Germanist Adolf Holtzmann. He was born at Karlsruhe, 17th May 1832, became in 1861 extra-ordinary, in 1865 ordinary professor of Theology at Heidelberg, and obeyed in 1874 a call to the theological faculty at Strassburg. Holtzmann set out as an exponent of the 'Vermittelungstheologie,' but gradually became one of the chief representatives of the more advanced modern school. He died 6th August 1910.

Holy Alliance, a league formed (1815) after the fall of Napoleon by the sovereigns of Russia, Austria, and Prussia, whereby they pledged themselves to rule their peoples like fathers of families, and to regulate all national and international relations in accordance with the principles of Christian charity. But the alliance was made in actual fact a means of mutual encouragement in the maintenance of royal and imperial absolutism, and an instrument for suppressing free institutions and checking the aspirations for political liberty struggling into realisation amongst the nations of the Continent. The league died a natural death after the lapse of a few years.

Holy Coat of Treves. See TRIER.

Holy Ghost. See SPIRIT, CREEDS.

Holy Grail. See GRAIL.

Holy Grass (*Hierochloe borealis*), a sweet-smelling grass belonging to the tribe Phalarideæ, about a foot high, with a brownish glossy lax panicle. It is sometimes strewed on the floors of churches on festival-days, whence its name.

Holyhead, a seaport (once a parliamentary borough) of Anglesey, is situated on a small island of the same name, 60 miles E. of Dublin, 85 W. of Chester, and 264 N.W. of London. It is the port for Dublin. The shipping accommodation consists of a harbour with two divisions, and a roadstead sheltered by a Breakwater (q.v.). Pop. (1875) 5622; (1901) 10,072; (1921) 11,757, employed in the coasting trade and in shipbuilding and rope-making. Till 1885 Holyhead united with Amlwch, Beaumaris, and Llangefni in sending one member to parliament.

HOLYHEAD ISLAND, west of Anglesey, is 8 miles long by $3\frac{1}{2}$ broad. Nearly all the population is in the town. The island is separated from Anglesey by a narrow sandy strait, crossed by a causeway, along which run the Holyhead road and the railway. It is arched in the centre for the tide to pass beneath. The island is for the most part rocky and barren. On the north-west coast are two islets, the North and South Stacks. The Stacks and the north coast are hollowed out into magnificent caves, the haunt of sea-fowl.

Holy Island, or LINDISFARNE, a small island of Northumberland, $9\frac{1}{2}$ miles SE. of Berwick-on-Tweed. It is 3 miles long by $1\frac{1}{2}$ broad, and has an area of 1000 acres. At low-water it can be reached by walking across the sands, a distance of $3\frac{1}{2}$ miles; at high-water the strait covered by the sea is $1\frac{1}{2}$ mile wide. The village is guarded by the castle, built about 1500, and still in good repair. The island is chiefly interesting for the ruins of its Benedictine priory church. This was built in 1093 out of the materials of the ancient cathedral, erected here in the 7th century, under the auspices of Bishop Aidan. Here a company of Columban monks established themselves, and grew into the famous priory of Lindisfarne, the luminary of the north, the Iona of England. It reached its greatest glory under St Cuthbert (q.v.). The cathedral suffered severely from the ravages of the Danes, and was gradually allowed to fall into ruins as Durham grew into importance.

Holy Land. See PALESTINE.

Holyoake, GEORGE JACOB, a zealous labourer for bettering the condition of working-men, a writer on co-operation, and the founder of 'Secularism, a system which bases duty on considerations purely human, relies on material means of improvement, and justifies its beliefs to the conscience, irrespective of atheism, theism, or revelation.' He was born at Birmingham on 13th April 1817. During the course of his life he filled various offices and took an active share in various public movements. He taught mathematics at the Mechanics' Institution in Birmingham, lectured on Robert Owen's socialist system, acted as secretary to the British contingent that went to the assistance of Garibaldi, edited the *Reasoner*, was influential in securing the repeal of the newspaper stamp duty (1854), was chiefly instrumental in getting the bill legalising secular affirmations passed (1869), exerted himself on behalf of settlers in Canada and the United States, and devoted his later years to his secular schemes and co-operation. Holyoake was the last person imprisoned in England on a charge of atheism (1841). He

was president of the Carlisle Congress of the Co-operative Societies, 1887. He wrote a *History of Co-operation in Rochdale* (2 parts, 1857-72), the *History of Co-operation in England* (2 vols. 1875-79; revised and completed ed. 1906), *Self-help a Hundred Years Ago* (1888), *The Limits of Atheism* (1861), *Trial of Theism* (1877), *Life of J. R. Stephens* (1881), *Sixty Years of an Agitator's Life*, *Bygones worth Remembering*, *Reminiscences* (2 vols. 1905), *Nature and Origin of Secularism* (1896), and contributed several articles to *Chambers's Encyclopædia*. He died 22d January 1906. See the *Life* by McCabe (1908; abridged, 1922).

Holy Office. See INQUISITION.

Holyoke, a city of Massachusetts, 8 miles N. of Springfield, on the Connecticut River, is a great seat of the paper-making trade, and has over a score of paper-mills, besides numerous cotton-factories and woollen-mills, manufactures of metal, wooden, and other wares. Pop. (1870) 10,733; (1890) 35,637; (1910) 57,730; (1920) 60,203.

Holy Roman Empire, said by Voltaire to be so called because it was neither an empire, nor Roman, nor at all holy. See ROMAN EMPIRE (HOLY), GERMANY, CHURCH HISTORY.

Holyrood, an abbey and palace of Edinburgh. In the year 1128 King David I. of Scotland founded at Edinburgh an abbey of canons regular, of the order of St Augustine. According to the legend, it was founded on the spot where the king, whilst hunting on Rood Day in the fourth year of his reign, in the forest that then surrounded Edinburgh, was thrown from his horse and nearly gored by a hart, and was only saved by a mysterious hand putting a flaming cross between him and the animal, at sight of which the hart fled. The abbey was accordingly dedicated to the Holy Cross or Rood. The dedication might also have been suggested by the famous cross-shaped reliquary of wrought gold brought to Scotland by St Margaret, wife of Malcolm Canmore, about 1070. This casket was held in great veneration as containing a splinter of the true Cross, and became one of the heirlooms of the kingdom. The Black Rood of Scotland, as it was called, was carried before the army of David II., and fell into the hands of the English at Neville's Cross. Placed in St Cuthbert's shrine at Durham, it disappeared at the Reformation. The foundations of a Celtic church were found within the ruins during excavations in 1911. The abbey church was built in the Norman and early Gothic styles. The abbey was several times burned by the English, especially in 1544 (when the transepts were destroyed) and 1547. At the Reformation the monastery was dissolved; and the abbey church having been repaired was henceforth used as the parish church of the Canongate. In 1687 James VII., having built another parish church for the Canongate, converted the abbey church into the chapel royal of Holyrood. It was plundered and burned by the mob at the Revolution in 1688, and remained in neglect until 1758. In that year it was repaired and roofed; but the roof was too heavy for the walls, and it fell in 1768. Since then the chapel has been left in a state of ruin. The vault, built as a burying-place for the royal family of Scotland, contained the ashes of David II., James II., James V., and of many other royal and historical personages, such as the Duke of Albany, Lord Darnley, &c.

The abbey of Holyrood early became the occasional abode of the Scottish kings. Robert Bruce and Edward Baliol held parliaments within its walls. James II. was born in it, crowned in it, married in it, buried in it. The foundations of the palace,

apart from the abbey, were laid about 1501 by James IV., who made Edinburgh the capital of Scotland. Henceforth Holyrood Palace was the chief seat of the Scottish sovereigns. It was mostly destroyed by the English in 1544, but immediately afterwards rebuilt on a larger scale. Queen Mary took up her abode in the palace when she returned from France in 1561. Here, in 1566, Rizzio was torn from her side and murdered. It was garrisoned after the battle of Dunbar in 1650 by Cromwell's troops, who burned the greater part of it to the ground. It was rebuilt by Charles II., from the designs of Sir William Bruce of Kinross, between 1671 and 1679. After the accession of James VI. to the throne of England it ceased to be occupied as a permanent royal residence. But George IV. held his court in it in 1822, and later sovereigns have occasionally occupied it. The disposition of the rooms in the older portion seems to be much the same as in the time of Queen Mary. The picture-gallery, containing a long series of fabulous 'portraits' of real or hypothetical Scottish kings, and a few genuine works of art, possesses romantic interest as the scene of the balls and receptions of Prince Charlie in 1745. In 1906 Lord Leven and Melville left £40,000 for the restoration of the Chapel Royal on certain conditions, which were not accepted.

The palace, with its precincts and park, was in Catholic times a sanctuary for all kinds of offenders, but afterwards the privilege of Sanctuary (q.v.) was confined to insolvent debtors—De Quincey the most illustrious of them. But from recent legislation, especially the Debtors (Scotland) Act, 1880, the protection no longer exists. See *Historical Description* (1819), Wilson's *Memorials of Edinburgh* (1848), and books by Moir Bryce (1914) and Harrison (1919).

Holy Sepulchre, KNIGHTS OF THE, an order of knighthood instituted, probably by Pope Alexander VI., for the guardianship of the Holy Sepulchre, and the relief and protection of pilgrims. On the recapture of Jerusalem (q.v.) by the Turks the knights retired to Italy, and settled at Perugia. For a time united with the Hospitallers, the order was reconstituted (1814) in France and in Poland.

Holy Spirit. See SPIRIT.

Holy Water, in the Roman Catholic, as also in the Greek, Russian, and Oriental churches, signifies water blessed by a priest or bishop for certain religious uses. Water is, almost of its own nature, a fitting symbol of purity; and accordingly, in most of the ancient religions, the use of lustral or purifying water not only formed part of the public worship, but also entered largely into the personal acts of sanctification prescribed to individuals. The Jewish law contained many provisions to the same effect. The usage of sprinkling the hands and face with water before entering the sanctuary, prescribed in the Jewish law for those ceremonially unclean, was very early adopted in the Christian church. It is expressly mentioned by Tertullian in the end of the 2d century. And that the water so employed was blessed by the priests we learn from St Jerome, among others, and from the Apostolical Constitutions. Although it is difficult to fix the precise time, it cannot be doubted that the practice of mingling salt with the water is of very ancient origin. In the Western Church there is a solemn blessing of water in the service of Holy Saturday, but the ceremonial is repeated by the priest whenever necessary. Holy water is placed in Bénitiers (q.v.) at the doors of churches that worshippers may sprinkle themselves with it; before high mass on Sundays the celebrant sprinkles the people with holy water;

and it is used in nearly every blessing given by the church. Instructed Catholics regard the use of holy water chiefly as a means of suggesting to the mind the necessity of internal purity; and although it is supposed to derive from the blessing a special efficacy for this end, yet this efficacy is held to be mainly subjective and of a character entirely distinct from that ascribed to the sacramental rites of the church. See **BENEDICTION**; also **ABLUTION**, **BAPTISM**.

Holy Week, the week immediately preceding Easter, and specially consecrated to the commemoration of the Passion of our Redeemer. This institution is of very early origin, and the name Holy Week is but one of many by which its sacred character has been described. In English use it is called 'Passion Week' (a name appropriated, in Roman use, to the week before Palm Sunday). It was also called the 'Great Week,' the 'Silent Week,' the 'Week of the Holy Passion,' the 'Vacant Week,' the 'Penitential Week.' In the Roman Catholic Church the special characteristics of the celebration of the Holy Week are increased solemnity and gloom, penitential rigour, and mourning. If any of the ordinary church festivals fall therein, it is deferred till after Easter. All instrumental music is suspended in the churches, the altars are stripped of their ornaments, the pictures and images are veiled from public sight; manual labour, although it is no longer entirely prohibited, is by many persons voluntarily suspended; the rigour of fasting is redoubled, and alms-deeds and other works of mercy sedulously enjoined and practised. All church services of the week, moreover, breathe the spirit of mourning, some of them being specially devoted to the commemoration of particular scenes in the Passion of our Lord. The days thus specially solemnised are Palm Sunday, Spy Wednesday, Holy (or Maundy, q.v.) Thursday, Good Friday (q.v.), Holy Saturday. Holy Thursday in the Roman Catholic Church is specially designed as a commemoration of the Last Supper, and of the institution of the eucharist, although there are several other features peculiar to the day. To Holy Saturday belongs the solemn blessing of fire and of the water of the baptismal font; and from the earliest times it was set apart for the baptism of catechumens, and for the ordination of candidates for the ecclesiastical ministry. From the 'new fire,' struck from a flint, and solemnly blessed on this day, is lighted the Paschal Light, which is regarded as a symbol of Christ risen from the dead. This symbolical light is kept burning during the reading of the gospel at mass throughout the interval between Easter and Pentecost. It must be added, however, that in many instances the primitive institution of the Holy Week was perverted, and that the suspension of labour, designed for purposes of devotion, was turned into an occasion of amusement not infrequently of a very questionable character. Such abuses are now universally discountenanced by the ecclesiastical authorities. See **FASTS**, **FESTIVALS**; and Feasey's *Ancient English Holy Week Ceremonial* (1897).

Holywell (Welsh *Treffynnon*), a market-town, once a parliamentary borough, of Flintshire, North Wales, on an eminence 15 miles NW. of Chester. It is the seat of numerous lead, iron, copper, and zinc mines, and has smelting-works, manufactures of paper, flannel, and Roman cement, and tanyards and breweries. The borough united till 1918 with Flint, Mold, &c. in returning one member to parliament. Pop. 3000. Holywell owes its origin to the renowned well of St Winifred, which, until diminished by drainage works, was estimated to deliver 4700 gallons of water per minute. The Perpendicular chapel over the well is attributed to

Margaret, mother of Henry VII. It is still a place of pilgrimage for Roman Catholics. See Pennant's *History of Holywell* (1796).

Holz, ARNO, German poet, dramatist, and novelist, was born 26th April 1863 at Rastenburg in East Prussia, and lived in Berlin. With his friend Johannes Schlaf he published a collection of short stories, *Papa Hamlet* (1889), which is regarded as the starting-point of German impressionistic naturalism. A similar tendency had already shown itself in his book of lyrics, *Das Buch der Zeit* (1885), 'one of the most important landmarks in the history of modern German poetry,' and continued in later works of poetry, drama, and fiction, of which the fine tragedy *Sonnenfinsternis* (1908) should be mentioned.

Homage (Old Fr.; Low Lat. *homaticum*; Lat. *homo*, 'man') is the service due from a knight or vassal to his lord in feudal times, the vassal professing to become his lord's man. See **FEUDALISM**.

Homburg, or **HOMBURG VOR DER HOHE**, a town of Hesse-Nassau, is situated at the foot of the Taunus Mountains, 8 miles NNW. of Frankfurt-on-the-Main. It has beautiful environs, and is much frequented by visitors on account of its mineral waters, which possess saline and chalybeate properties, and are considered effective in cases of disordered liver and stomach, for hæmorrhoidal and menstrual disorders, and for gout, rheumatism, and skin diseases. Thousands of bottles are sent away annually. The gaming-tables were suppressed in 1872. Homburg hats—men's soft felt hats—were first worn here. Pop. 14,000.

Home, the name of one of the oldest and most celebrated of the historic families of Scotland. After the Conquest Cospatrik, the great Earl of Northumberland, took refuge in Scotland, and received from Malcolm Canmore the manor of Dunbar, and large estates in the Merse and the Lothians. Patrick, the second son of the third Earl of Dunbar, inherited from his father the manor of Greenlaw, and having married his cousin, daughter of the fifth earl, obtained with her the lands of Home, from which his descendants took their designation. After the overthrow of the earls of Dunbar and March in 1436 the Homes succeeded to a portion of their vast estates and to a great deal of their power on the eastern Marches. Sir Alexander Home was created a peer by James III.; but, disappointed in his attempt to appropriate the revenues of Coldingham Priory, he joined the disaffected nobles who rebelled against James, and took part in the battle of Sauchieburn, where the king was killed. The second baron obtained estates and important offices from James IV. Along with Lord Huntly he commanded the vanguard of the Scottish army at Flodden, and routed the English right wing. He was almost the only Scottish noble who returned unhurt from that battle. He was induced by fair promises from the Regent Albany to visit Holyrood along with his brother William in 1516, and they were arrested, tried for treason, and condemned and executed. The forfeited title and estates were restored to his brother George in 1522; but, though the family took a prominent part in public affairs during the troublous times of Queen Mary and the great civil war, they never regained their former influence. Their extensive estates dwindled down to a patrimony of 2000 acres, and they sank into insignificance. But the marriage (1832) of the eleventh earl to the heiress of the Douglas estates restored the decayed fortunes of this ancient house. The Earl of Home sits in the House of Peers as Baron Douglas.

Home, DANIEL DUNGLAS, spiritualist, was born near Edinburgh, 20th March 1833, and was

taken by an aunt to the United States, where by 1850 he had become a famous medium. He began the study of medicine, but was persuaded by his friends to practise spiritualism instead; and in 1855 he removed to London to carry on his 'mission.' Home was a proficient in mesmerism and such-like sciences, and to table-turning and spirit-rapping he added, for advanced disciples, speaking ghosts, and a display of his own powers of floating in the air. He made many converts, though not all the great people he claimed. He was presented at several courts, and to the pope; and he joined the Roman Catholic Church, but was ultimately expelled for spiritualistic practices. In 1866 he acceded to a Mrs Lyon's suggestion that he should become her adopted son, she assigning to him £60,000; but this money his fickle patroness afterwards compelled him to restore, and the lawsuit discredited Home greatly, though he was scarcely to blame in the matter. He died at Auteuil, 21st June 1886. He published two series of *Incidents of my Life* (1863 and 1872), and *Lights and Shadows of Spiritualism* (1877); see also *D. D. Home: his Life and Mission* (1888), and a continuation, *The Gift of D. D. Home* (1890), both by his widow.

Home, HENRY. See KAMES (LORD).

Home, JOHN, Scottish clergyman and dramatist, was born at Leith in 1722. He graduated at the University of Edinburgh in 1742, and three years later entered the church. He was present as a volunteer on the king's side when the royal forces were routed by the Young Pretender at Falkirk, and was carried a prisoner to the castle of Doune, whence he effected his escape. In 1747 he was appointed minister of Athelstaneford, near Haddington, where he composed in 1747 the tragedy of *Agis*, and, after the lapse of five years, *Douglas*, a tragedy founded (before the publication of Percy's *Reliques*) on the ballad of Gil Morrice. Each of these plays was successively rejected by Garrick; but *Douglas*, brought out at Edinburgh, met with instant and brilliant success, and evoked equal enthusiasm when placed on the London boards. Its production, however, gave such offence to the Presbytery that the author thought fit to resign his ministry, and, withdrawing into England, he became private secretary to the Earl of Bute, who procured him a pension of £300 a year. The success of *Douglas* induced Garrick not only to accept Home's next play, *The Siege of Aquileia*, but to bring out the earlier work, *Agis*. Home's other works are *The Fatal Discovery*, *Alonso*, *Alfred*, occasional poems, and, in prose, *A History of the Rebellion of 1745*. He died in 1808.

Home is the last of our tragic poets whose works for any time held the stage. The drama, purified from the licentiousness of Wycherley and Congreve, had become frigid and lifeless in the hands of Addison, Rowe, and Johnson, and the enthusiasm with which *Douglas* was greeted was due to the generous warmth of domestic feeling, the chivalrous ardour and natural pathos which Home infused into his work. His writings are remarkable for the interesting character of their plots, for lucidity of language, and for occasional flashes of genuine poetry; but he did not succeed in entirely discarding the pompous declamation of his forerunners. In his day he enjoyed the praise of all and the friendship of the most distinguished; Collins dedicated to him his ode on the Highland superstitions, and Burns, with more zeal than judgment, said that he

Methodised wild Shakespeare into plan.

The taste of his time is not that of ours, but the dramatists who displaced him turned to comedy, and he had no successor of equal fame. See the *Life* by Henry Mackenzie, prefixed to his works (3 vols. 1822).

Home Counties, the counties over and into which London has extended—Middlesex, Hertfordshire, Essex, Kent, Surrey. The south-eastern circuit (see ASSIZE) is still sometimes called the 'Home Circuit,' though it includes, besides the home counties (except Middlesex), also Cambridgeshire, Norfolk, and Suffolk.

Homelyn. See RAY.

Home Office. See SECRETARY OF STATE.

Homer (*Homēros*) was the name given by the Greeks to the author of the *Iliad* and *Odyssey*; certain hymns; and a parody of heroic poetry, *The Battle of the Frogs and Mice*. A much larger mass of epic poetry, whereof few fragments ('the Cyclic poems') remain, was also called 'Homeric,' but as soon as criticism arose these 'Cyclic poems' were gradually withdrawn from the canon.

Of Homer's date and birthplace nothing was known to the Greeks. Many cities claimed to be his birthplace, mostly in the isles and among the early Greek colonies in Asia. There were various fables as to the time when and the manner in which his poems were brought to Sparta and Athens. These tales probably mean no more than that the Ionian colonies took the lead in literature as in philosophy at the beginning of the early Greek historic period, from the 8th century B.C.; while the Ionians, with singular assurance, claimed Homer for their own. By their own account of themselves, they were members of a people settled in Greece before the arrival of Homer's men, the invading Achæans, but when they sought new lands in Asia they were accompanied by migrants of various stocks, 'a mixed multitude.' As a matter of fact, Homer only once mentions the Ionian name, while his references to Athens, recognised as the 'mother-city' of many Ionian towns, are very scanty; no Ionian legends, no Attic legends, are narrated by Homer, and his two or three allusions to the chief Attic hero, Theseus, are not believed to be genuine. The heroes of Homer he usually styles 'Achæans;' also 'Danaans' and 'Argives.' They are dwellers in northern Greece, as in southern Thessaly, in Peloponnesus, Crete, and many islands. They reside in Mycenæ, Tiryns, Cnossos in Crete, Pylos, and many other cities, of which the ruins are prehistoric; while excavations (by Schliemann, Sir Arthur Evans, Professor Halbherr, and many others) prove that the early inhabitants lived in a minor degree of splendour in the rude civilisation called 'Minoan,' and best illustrated in the palaces and relics of Cnossos, and in the royal graves of Mycenæ. This widespread civilisation, from the middle of the third millennium B.C., was in touch with Egypt, was in the Bronze Age of culture, iron being all but unknown, and had various systems of writing. When Homer speaks of weapons, jewels, and so forth, his descriptions tally best with the obscure period of the decay of Minoan art and culture. His weapons are of bronze, his implements usually of iron, which indicates an overlap of the bronze and iron ages, but scantily corroborated so far by the discoveries of excavators. The costume of his men and women is not that of any Minoan period, when men in active life wore but a loin-cloth or pair of bathing-drawers as a rule; while the women wore shaped and sewn dresses with separate bodices and skirts in many varieties of fashions, some familiar to Tudor, others, strange to say, to early Victorian and late 18th-century England. Homer's men wear smocks or chitons, loose, long, and girded up, with a great cloak when the weather is cold. The women wear a long, loose smock, kirtled up so as to form a *kolpos* about the bust; over these they wear mantles.

The Minoans inhumed their dead in sunken pits, shaft-graves, and in the stone *tholos*. The dead in

Homer, on the other hand, are always cremated: the ashes are placed in a vessel, often of gold, within a chamber, and above all a cairn is piled, contained by a coping of upright stones. Thus the dress in Homer is northern—the smock and plaid or cloak—while the mode of burial is that of the cairns of northern Europe. The descriptions of burial in Homer and in the Anglo-Saxon epic *Beowulf* are practically identical. Meanwhile no certain example of the Homeric cairn with its contents has been discovered in Greece or on the Asian coast; while in Greek art of the Dark Ages, say 950-600 B.C., the dress of the men in the rude works of art is more Minoan than Homeric, and even the women sometimes wear the separate bodice and skirt of Minoan times. If we take Homer, like other early poets, to present his men and women in the costume of his own day, and to introduce its weapons and implements, we may suppose him to have lived while the tradition of the Minoan art was still held in lively memory, but during the dawn of the Age of Iron, and among a people whose costume and burial rites were still non-Minoan, and were of northern origin. Later, living under a warm climate and intermarrying with a pre-existing people, they took to the dress of that people, as in the art of, say, 950 to 550, when dress began to revert to the Homeric, which, as described, was like that of the 5th century B.C. We may argue that Homer may have sung about 1000 B.C. The armour in his poems—helmet, suspended shields of several shapes, corselet, and greaves—may, except the corselet perhaps, be illustrated from works of art, Egyptian and Ægean, of the period of 'folk-wanderings,' from 1200 downwards. Contrary to the opinion of Reichel, corselets were not unknown even in late Minoan times, and a pair of bronze greaves of the late Minoan age of Cyprus are in the British Museum. Homeric armour is also illustrated down to that minute point, the butt-spike of the spear, in the Books of Samuel, which, in their general contents, the highest criticism does not place later than 900 B.C.

The society of Homer is that of 'unchartered feudalism.' There is an overlord by divine right ruling in well-known conditions over the princes, as in the earliest Irish romances, the romances of Arthur, and the early *Chansons de Geste* about Charlemagne. The blood-feud is modified, as in the Iceland of the sagas: men may take atonement in gold, cattle, and so forth for the death of a kinsman. Coined money is unknown. The bride-price is paid for women, and is returned by her family in case of the wife's adultery. The Ionian and historic Greek rite of purification of man-slayers is unknown. There is not, as among Ionians and in historic Greece, any worship of the dead, who wander, powerless shades, unable to help or harm, in a Hades like the Sheol of the Books of Samuel. Men slain in battle are despitely treated; they may be mutilated, and their heads impaled on stakes, things hateful to the historic Greeks.

As in early Ireland, Scotland, Gaul, and Egypt, men fight from chariots, not on horseback, but they mainly fight dismounted, as in the French wars of Edward III. to Henry VI., using the chariots for pursuit and retreat. 'The host' is light-armed, using bows and slings; the gentry are full-armed and use chariots. In all these respects Homer represents the heroic and prehistoric age of Greece apparently as it was before the period of the Æolic and Ionian settlements in Asia. These, according to legend, were caused by the Dorian invasion of Greece. Neither the settlements in Asia nor the arrival of the Dorians are alluded to by Homer; with him Miletus is a Carian city, non-Hellenic. He shows no knowledge of the Black Sea or Euxine; his knowledge of Egypt is derived from

such Viking raids as those of the 12th century B.C. and later.

His picture of life is quite uniform, all of a piece, and has many well-known parallels in early mediæval Europe. If we argue that the epics are by many hands, from 1400 to 500 B.C., or even later, the poets or their editors were deeply skilled archæologists, true in all details to the life described in early lays of great antiquity—an opinion not easily tenable. Again, Homer is certainly not an Ionian. 'The choice of Ionic as the language of the Homeric poems is no argument for the Ionian birth of the author (or authors).' Homer is not 'the Ionian father of the rest' (D. B. Monro). The Ionic imitations of Homer, 'the Cyclic poems,' of about 780-650, are full, even in the fragments which survive, of un-Homeric ideas and usages, such as the worship of the dead, visible ghosts, and the rite of purification. These poems also celebrate Athenian heroes, tell fairy-tales of a juvenile description, degrade the character of Homer's heroes, and introduce, as much their superior, a culture hero, Palamedes of Nauplia. Neither he nor his coastal town is ever hinted at by Homer. They also speak of Greek settlements in Asia. For these and other reasons we may regard Homer as a prehistoric poet of the Achæans, a northern people, who played the part of the Normans in later times. As conquerors of an earlier Ægean people, later they merged into the mass of the earlier race, adopting many of their ways and beliefs.

The language of the highly civilised earlier people, or peoples, is unknown. They were at all events white men, with a remarkable genius for the arts, which, after a barbaric period, re-emerged in the 8th century, and advanced to absolute perfection in the 5th century. Whether we call them 'Ægeans' or (after Minos, the mythical Cretan king) 'Minoans,' their language cannot be determined till we can read their writings. But many place-names in Greece, such as Corinth, which Homer calls Ephyre, are held to be non-Greek. On the other hand, if Attica and the Ionians were, as they declared, pre-Achæan, their language was Greek. The Athenians boasted that Attica had never been conquered by the Achæans, and it had an entirely un-Homeric set of legends. When they took up the epics they distorted and degraded the characters of Homer's men; the Romans (as descendants of Troy) handed the hostile Attic fables on to the romancers of the Middle Ages, and they to Chaucer, and finally to Shakespeare, in *Troilus and Cressida*. That play, however, shows some knowledge of the *Iliad*.

The question as to how the Homeric poems were preserved down to the age of the Greek alphabet is entirely obscure. Homer only once mentions writing, the 'baneful signs' of a treacherous letter (*Iliad*, vi. 168, 169); and though we know that characters were written in pen and ink, and often incised in clay, by the Minoans of Crete, while Greek writing may apparently have existed as early as the 9th century at least, we can say no more than that still earlier manuscripts of the epics may have been made, while the 'Homeridæ' of Chios may have preserved Homer in memory. All this is uncertain. The discovery of pre-Homeric writing is due to the genius of Sir Arthur Evans (see his *Scripta Minoa*).

In earlier times of criticism the supposed lateness of writing in Greece suggested to the famous Wolf (1795; see his *Prolegomena ad Homerum*) that the epics could never have been fashioned in an illiterate age, and that the poet could have no audience for them even if he could write or dictate them. (Of course a princely court provided a stationary and regular audience night after night.) The poems, according to Wolf, were preserved by

reciters or rhapsodists, who might add or omit at pleasure, unchecked by authority; and Wolf went so far as to say that 'History speaks'—the epics were first written by order of Pisistratus of Athens, say, in 560 B.C. History is silent on the question. Various late 4th century legends babble variously as to something done by Solon, Pisistratus, his sons, or some one else, for Homer at Athens. The evidence is very late, and is contradictory, and is ignored by Herodotus and Thucydides. Almost certainly some law was made at some time in Athens regulating the public recitation of 'Homeric poetry'; what these terms mean in this connection, whether *Odyssey* and *Iliad* alone or all the early heroic poetry, is matter of controversy.

The idea that a commission, about 560-540, or several commissions, then, and earlier, and later, practically patched up the epics into something like their present form, out of lays very old and lays much later with matter inserted by the editors or the reciters, is mere conjecture, and every critic presents his own private form of the guess. Quite certainly there were many copies about 200 B.C. and later of Homer on papyrus (fragments are found in Egypt) which contained many lines not in our text, and of no literary value. Much was done for the text by the great Alexandrian grammarians, notably by Aristarchus. Their suggestions reach us through the *scholia*, notes by still later grammarians.

Since Wolf, innumerable learned men, Germans mainly, with a host of English camp-followers, have made vigorous efforts to discern the later and earlier portions in what they regard as the patchwork of many centuries. Their theories contradict each other, and vary from year to year, the English gillies devoutly following. They detect so many discrepancies in narrative and so many varieties of period in grammar that few lines in Homer have escaped challenge by one theorist or another. Two arguments for Homeric unity remain unshaken. First, the discrepancies in narrative (except those invented by the critics) are not more numerous or more glaring than those we find in the *Æneid* of Virgil or the works of Cervantes, Scott, Shakespeare, and Thackeray. Secondly, the drawing of Homer's multitude of characters is thoroughly consistent and minutely delicate. Shakespeare is not greater than Homer in the creation and coherence of his characters. The fact is fatal to any theory of a multitude of hands working throughout from three to six centuries. If any of the acute and erudite critics who have held that the *Iliad* is a batch of the short lays stitched together, or that it has a solid kernel of some 3000 lines about the wrath of Achilles, to which, through three or four or more centuries, additions were gradually made by poets and editors and reciters, or, again, the notion most 'up to date,' that the wrath of Achilles was one of the latest additions to the poem, would devote himself to a study of the characters of Homer's personages as literary creations, it is probable that, with Professor Van Leeuwen, he would exclaim, 'One poet, one poem!' But the 'man-microscopes' of Comparetti's taunt pry into the details till they are incapable of seeing the majestic whole. The epics are literature, and no literary work except Homer's is judged in the microscopic manner. The results are arbitrary. Professors tell us how they would have written the *Iliad*, 'if they had the mind'; they would have written in many ways, none of them Homer's. But however interesting their revelations may be to the student of the psychology of professors, none of these critics is at the point of view, none was a singer to warriors and ladies in a court of prehistoric Greece. The 'militarism' of Homer is an offence to their pacific consciences, and, to be plain, they are not familiar, usually,

with the epics of other heroic ages, and with the ideas of other early national poetry, Irish, French, Icelandic, or ancient Anglo-Saxon, as in *Beowulf*. The man who would date Homer must have a comparative knowledge of all early literature, national or popular, and a knowledge of early law and custom. The modern English reader who knows Greek enough to read Homer in the original may study him, and the theories about the epics, in Mr Leaf's valuable edition of the *Iliad*, and in the *Rise of the Greek Epic* by Professor Murray, in Miss Stawell's *Homer and the Iliad*, in Mr Mackail's Oxford Lectures on Greek Poetry, and in Mr Shewan's *Lay of Dolon* (by a long way the most learned and humorous reply to the vagaries of the separatists or Wolfians). He will then have before him the views of the most recent English students on either side. Miss Stawell is a not wholly converted separatist, but her study of Homeric characters is admirable, and she, with Mr Shewan, pulverises the philological arguments and statistics of the hostile grammarians. For such contentions as they base on law, customs, religion, dress, and armour, the writer may perhaps be allowed to refer to his own books, *Homer and his Age* and *The World of Homer*, and to Sir W. Ridgeway's *Early Age of Greece*, varying on certain points from his own conclusions. The chief English archaeologists place Homer, as the writer does, at an early epoch of the age of Troy, at the close of the Mycenaean or latest Minoan period (see Sir Arthur Evans, *Scripta Minoa*, and Mr Hogarth, *Ionia and the East*).

The reader who is not familiar with Greek and with archaeological research must either take his opinions at second hand from the advocates of either party, or trust to his 'literary instinct' after reading the epics in the best prose translations, or, for the *Odyssey*, in Mr Mackail's beautiful and practically literal translation of that poem into English verse. No other versified translation of the *Odyssey*, and no versified translation of the *Iliad*, in English is of any use for merely scientific purposes. Meanwhile no poet since Wolf's day, from Goethe downwards, has been a Wolfian except Coleridge only.

It must be remembered that the great majority of the erudite are followers, in their very various ways, of Wolf. A reaction in favour of Homeric unity has, however, begun, and the need of a great poet, using older legends and lays as the materials of his great poem, is now felt. True, some critics place him late, and in Ionia; but it is hard to understand how the great poet, in an uncritical age, could be a great archaeologist and student of the many prehistoric institutions which Homer accurately describes. The authors of the Cyclic poems (770-650) certainly knew and cared for none of these things, and constantly betray themselves as un-Homeric by introducing ideas, rites, and knowledge not found in the *Iliad* and *Odyssey*. Thus they speak of the Morea as 'the isle of Pelops' (Peloponnesus), a term not in Homer. With them, as the ancient Greeks observed, purification of man-slayers in pig's blood was an unvarying custom. It is not a northern custom, and is never mentioned by Homer, often as he mentions man-slayers. This rite, with worship of the dead, by Homer mentioned in Athens only, prevailed in historic Greece (see Monro's edition of the *Odyssey*, note on the Cyclic poems). These poems were rather verse-chronicles of legends—like Blind Harry's *Wallace* and Barbour's *The Brus*—than epics like the *Iliad* and *Odyssey*, dealing with a brief space of time and presenting, as Aristotle says, a definite 'beginning, middle, and end.'

Thus the *Iliad* deals with the wrath of Achilles, its consequences, and its conclusion, the central action occupying but a few days in the last year of

the siege of Troy. Achilles, son of the sea-goddess Thetis and of Peleus, an Achaean prince, has chosen 'one crowded hour of glorious life' rather than long life in peace. He knows that he is doomed to fall in front of Troy, in quest of honour. But his honour is constantly degraded, he complains, by the overlord Agamemnon. When Agamemnon takes from him his prize of honour, his beloved Briseis, he prays his mother to entreat Zeus to avenge him by enabling the Trojans to slaughter the Achæans among their ships. Vengeance, not apology and atonement, is his sole desire. He and his friend Patroclus stand aloof from the war (Book I.). The next seven books are full of the details of the war. The middle is reached (Book IX.) when Agamemnon, in disguise, offers to Achilles apology and rich gifts of atonement. These Achilles refuses; he has not seen the Achæans slaughtered beside the ships. He has now, according to the ideas of the age, put himself in the wrong, and is warned that evil will recoil on his own head. But he will not fight till Hector brings fire against his own ship. The war goes on through many episodes, till (Book XVI.) fire is brought against the ships. Even now Achilles will not stir, but sends out his contingent under his beloved Patroclus, clad in his own armour. Patroclus is not to pursue the Trojans to the city; he disobeys, and Hector, aided by Apollo, slays him and takes his armour, threatening to deny him burial. The curse has fallen on Achilles, and his wrath now lights on the head of Hector. He consents to make peace with Agamemnon (Books XVII.-XIX.). Once more Achilles puts himself in the wrong by the horror of his treatment of the body of the slain Hector (Books XX.-XXII.). Then follows the burial of Patroclus, and the gods recall Achilles to himself; he listens to the prayer of Hector's father, Priam, and restores the body of Hector.

As Bonaparte said, 'Homer is the encyclopædia of his age.' Noble as are the descriptions of the gods, they are often on a much lower moral level, and are treated in a more humorous style, than the men and women. Homer's gods and goddesses, we may say, are even more human than his men and women; they have much less dignity and courtesy. Zeus is good-natured, hot-tempered, father of a family whom he delights to irritate, and, as the husband of a wife of feminine jealousy, something of a shrew, he gives her every excuse for her unamiable emotions. The family 'scenes' on Olympus are not repeated in Homer's human world. There, except Thersites and the old beggar Irus, no man is misshapen like Hephaestus, who makes the gods his brothers laugh by his hobbling gait.

Meanwhile there are passages in Homer which express the very heart of religions, 'for all men have need of the gods;' and that humorous, licentious Zeus expresses a poignant pity for the mortals who are his children, and whom he cannot save against the decrees of fate, the *wyrd* of the half-Christian Anglo-Saxon poem of *Beowulf*. The gods are the protectors of righteousness; yet they, not men, are the chief of sinners. Thus Homer makes the gods, as represented in myth, his most humorous characters, while he has the deepest reverence for the gods in their religious aspect. Their humours are explained by some critics as late lax Ionian interpolations, but the humours are too ancient in mythology, and too deeply intermingled with the fabric of the epic. It almost seems as if Homer, while retaining religion, wished to laugh Greece's mythology away. But to consider thus is to consider too curiously. He found religion and myth made to his hand, and combined them as suited his purpose—to entertain his audience. In the same way, his general tone is princely and chivalrous, he is a courtly poet; but he neglects

nothing in the life of the people and of the poor, on which he touches with a noble reticence of pathos. He is the poet of every rank and of every age, as dear to youth as to age, to the Demos of Athens as to his own knightly audience of ladies and princes.

In the *Odyssey* he turns to Romance; he interweaves for his plot several *Märchen* or popular tales, but raises them to the heroic level, maintaining his characters, Odysseus, Helen, Hector, and Menelaus, in entirely new circumstances, precisely as he left them in the *Iliad*, and dealing with fairy-tales and goddesses in 'a fairy way of writing.' Like the author of *Beowulf*, he has a shadowy background of 'old unhappy far-off things, and battles long ago.' We know that the poet of *Beowulf* drew for these digressions on lays now lost or surviving only in fragments, and Homer certainly had similar materials. But neither author used scissors and paste, neither cut suitable pieces out of older poems and pasted them into his work. What Homer, like the ballad-makers, did retain ready made were the verses that are formulae descriptive of habitual actions. These are very numerous. The critics think that each such line was originally made for one only of the various passages in which it occurs, and was borrowed by later interpolators. But they disagree with each other as to which was the original passage; and they might as well apply their theory to the Border ballads. From their point of view the epics are centos of quotations, like most modern Latin verse, with a number of fine things made by 'the original poet' or by gifted followers. But the fine things are not less rich in repetitions than those which critics attribute to 'the duffer' [i.e. one who 'fakes up' old or sham articles] the *Flick-poet*.

To be enjoyed Homer must be read as literature, for human pleasure, not as if his works were the draft of a Bill or of a Treaty. Unfortunately, the pleasure can scarcely be tasted in full measure except in the original Greek, for no translation, in verse or prose, can reproduce the exquisitely various music of the poet's verse. The consummate result, no doubt, of centuries of work, in poems long lost, was the Greek hexameter, so rapid, so sonorous, so successful in adapting itself to the poet's changing moods, and to the nature of the events or scenes or emotions with which he is dealing. No modern metre can vie with the Greek heroic hexameter; the couplets of Pope can render the great passages of rhetoric; the blank verse of Milton lacks rapidity; the Spenserian stanza used by Worsley is most successful in such fairy passages as the description of Circe's isle; the 'fourteeners' of Chapman ramble ineffectually, and anything like the measures of *The Lay of the Last Minstrel* wants dignity; while, if English hexameters might rival the Greek, no man yet has written them. A prose translation can give truth of fact, can give the matter of the narrative, but not the spirit. Homer's spirit and matter are of such quality that they lead captive schoolboys, and have filled the greatest poets of the world with delight. It would be worth while to learn Greek if nothing in Greek literature but the Homeric poems alone survived.

As to the amount of history in Homer, of social history there is abundance; everything is historical. But as to actual events, we now have reason to believe that the ancient prehistoric cities such as Mycenæ were for a while inhabited by a warrior people from the north, and it may be that the Troy of which Schliemann discovered the ruins was once attacked by this warrior people as the key of the sea straits leading to the Euxine. The quest was for commercial expansion and new markets, not for Helen, the world's desire. This is a modern notion worthy of the late Greek sophist who wrote the rationalised Attic version of the Tale of Troy,

the pseudo-*Dictys Cretensis*. Of course Troy may have fallen in a campaign for 'the open door' of the Euxine. But Homer's men could not have contemplated such a war; pirates they were, they 'went on viking,' but they left trade mainly, not wholly, to the Sidonians. One school may even argue that the earliest Achæan settlers in Asia found burned ruins of Troy, found the huge mounds on the plain, asked themselves, 'Who burned the town? What heroes lie in these enormous cairns?' and answered their own questions by the myth that their ancestors were the assailants, and that their quest was for Helen, for immortal Beauty. The heroes were buried in the mounds.

In his passion for the beautiful Homer resembles Plato. His magnificent pictures of the gods were designed in an age which at most had but clumsy images of the divine beings, yet his art inspired the art of Pheidias. Hence a daring critic has suggested that much of the epics is Athenian work of the age of Pericles or even later, as the costume and armour of Homer's women and men first appear, in the known art of Greece, at about the date of the Persian wars. This theory, if seriously held, would involve as many difficulties as does the crediting of Bacon with the plays of Shakespeare. It is a miracle that Shakespeare should have written the plays; it is a miracle that an Achæan poet should have composed the *Iliad* and *Odyssey*; it is a miracle that Jeanne d'Arc should have stayed the tide of English invasion. But miracles do happen—miracles of genius; while the miracle of the 'evolution' of the epics through four or six centuries is a portent without example in the history of literature.

A valuable study of this part of the problem may be read in Comparetti's book (translated) on the so-called epic of the Finns, the *Kalevala*.

BIBLIOGRAPHY.—Even a partial bibliography of the literature about Homer would occupy more space than this article. The student who would dip into the Homeric question should begin with its modern beginning, the *Prolegomena* of Wolf (1795) in Latin and untranslated. The argument is condensed and criticised in the writer's *Homer and the Epic*. Grote's treatment of the subject in his *History of Greece* (Grote is a cautious Wolfian) may be compared with Colonel Mure's unanswered advocacy of Homeric unity in his *History of Greek Literature*. A view of the conflicting theories of separatists may be found in the *Anhang* to Ameis's edition of the *Iliad*, and Volkmann's *History and Criticism of Wolf's Prolegomena* (1874), in German, may be recommended. The notes to D. B. Monro's edition of *Odyssey*, xiii-xxiv, are very artful; though his theories of Odyssean language have been much damaged by Mr Shewan and Miss Stowell in works cited in the text, with the edition of the *Iliad* by W. Leaf, and the *Rise of the Greek Epic* by Professor Gilbert Murray. The older and newer editions of Mr Leaf and Mr Murray ought to be compared.

[The preceding article was written by Mr Andrew Lang not long before his lamented death, and has accordingly not had the benefit of his revision in proof.

Other works that may be named are the researches of Wilamowitz-Möllendorf (1884) and those of Bérard on the *Odyssey* (1904); Sir Richard Jebb's *Introduction to Homer* (1887); Percy Gardner's *New Chapters in Greek History* (1892); Brown's *Handbook of Homeric Study* (1905); and the *Cambridge Companion to Greek Studies*, edited by L. Whibley (1905). In the books named above and in these will be found an index to the very extensive literature of 'the Homeric question.' See also the articles GREECE, MYCENÆ, TROY, SCHLIEMANN, ACHILLES, HELEN, ULYSSES. Of English translations may be named: *Iliad* (verse)—Chapman, Pope, Cowper, Lord Derby, Blackie, Worsley and Conington, Way, Wright, Green; (prose)—Leaf, with Myers and Lang; *Odyssey* (verse)—Pope, Chapman, Morris, Worsley, Lord Carnarvon, Way, Schomberg, Cotterill, Mackail; (prose)—Butcher and Lang; *Hymns* (prose)—Lang, White.—ED.]

Homer, WINSLOW (1836-1910), born in Boston, was bred a lithographer, but having studied in the

National Academy of Design, became special artist for *Harper's Weekly* during the Civil War. He exhibited his first large picture at New York in 1864, and next year was made an Academician. Settling at Scarboro, Maine, he became known for his genre pictures of American life ('Cotton-pickers,' &c.), fisherfolk, and ultimately of marine subjects such as 'A North-easter' and 'The Maine Coast.'

Homerides, or HOMERIDÆ, was the name of a family or clan in the island of Chios who claimed descent from Homer; and the same name was given by Pindar and others to the rhapsodists or guilds of poets who recited the Homeric poems.

Home Rule, specifically, a movement in British politics begun about 1870 to obtain self-government for Ireland through the agency of a national parliament (see IRELAND, O'CONNELL, BUTT, GLADSTONE, PARNELL); generically, a political principle in accordance with which the component parts or dominions of a country enjoy autonomy in their internal affairs.

Homestead, a suburb of Pittsburgh, on the Monongahela River, in Pennsylvania. Here grew up the great Carnegie iron and steel works. The riots of 1892 amounted almost to civil war. Pop. 20,000.

Homicide. See MANSLAUGHTER, MURDER, INSANITY.

Homildon Hill, a battlefield in Northumberland, 1 mile NE. of Wooler. In 1402 Earl Douglas at the head of 10,000 Scots had ravaged England as far as Newcastle, and was returning laden with booty, when on 14th September he was intercepted by an English army under Hotspur and the exiled Earl of March and Dunbar, so posted himself upon Homildon (Humbleton) Hill. Hotspur was eager for a headlong charge, but, by March's advice, the bowmen were set to play upon the Scots, who 'stood long like deer in a park to be butchered,' and, too late descending to come to close quarters, sustained an irretrievable defeat. Douglas himself was wounded in five places, and was taken prisoner, with four other earls, two barons, and eighty knights. See HENRY IV.

Homily (Gr. *homilia*) primarily signifies a discourse held with one or more individuals, but in ecclesiastical use it means a discourse held in the church. The practice of explaining in a popular form the lessons of Scripture read in the synagogues had prevailed among the Jews, and appears to have been adopted in the Christian churches from the earliest times; but we have no sample of this form of composition earlier than the homilies of Origen in the 3d century. The earlier Christian homily may be described as a popular exposition of a portion of Scripture, accompanied by moral reflections and exhortations. It differs from the sermon (Gr. *logos*, Lat. *oratio*) in following the order of the scriptural text or narrative, instead of being thrown into the form of a rhetorical discourse or a didactic essay. The name homily is, however, very frequently used almost as a synonym for sermon; and *Homiletics* is that branch of theology which deals with the rules for composing sermons and discourses of any kind, sometimes called 'sacred rhetoric.' Ancient collections of homilies or *homiliaria* are very numerous; the most notable being that compiled about 782 by Paulus Diaconus, under Charlemagne's authority.

The Homilies of the Church of England are a collection of sermons, the first part of which was published in 1547, the first year of the reign of Edward VI., to be read in the churches, partly in order to supply the defect of sermons, but partly, also, to secure uniformity of doctrine, and to guard against the heterodoxies, old and new, which at that time threatened the unconsolidated church. The second part was published in 1562, at the same

time with the Articles, under Elizabeth. The 35th Article declares that 'the Book of Homilies doth contain a godly and wholesome doctrine, and necessary for these times.' The titles are enumerated in the article, and are twenty-one in number. The homilies are not now read in churches; but there is no law to prevent their being so read, and they are frequently appealed to in controversies as to the doctrine of the Anglican Church on the points of which they treat. The precise degree of authority due to them is matter of doubt.

Hominy, a preparation of maize, coarsely ground and boiled; a kind of Indian corn porridge.

Homocercal. See HETEROCERCAL.

Homœopathy is the medical doctrine which teaches that diseases should be treated or cured by drugs capable of producing similar symptoms of disordered health to those presented by them; or, as it is commonly phrased, 'likes should be treated by likes,' or let likes be cured by likes—*similia similibus curentur*. The earliest mention of this doctrine occurs in one of the books attributed to Hippocrates, who taught that some diseases were cured by similars and some by contraries. In 1738 Stahl, a Danish army surgeon, wrote that 'the rule generally acted upon in medicine to treat by means of oppositely acting remedies is quite false, and the reverse of what ought to be; I am, on the contrary, convinced that diseases will yield to and be cured by remedies that produce a similar affection.' The celebrated Von Stöerck, in 1762, urged the same rule as a reason for using stramonium in insanity. Though impressed with the importance of this doctrine, these writers took no steps towards rendering it available in the practice of medicine. But it was reserved for Samuel Hahnemann (q.v.), in 1796, to prove by experiment that in this doctrine lay the key to the selection of specifically acting medicines; of medicines, that is, which cure by exercising a direct influence upon the parts diseased, as distinguished from those which relieve by what is termed their 'derivative' action. Thus taking, for example, the customary practice of endeavouring to control congestion of the brain by purgatives, by medicines operating not on the brain but upon the bowels, Hahnemann, as against this, asserted that congestion of the brain was most quickly and certainly cured by prescribing small doses of a medicine which previous experiment had proved to have a special influence upon the circulation in that organ. This doctrine, then, applies solely to that part of the treatment of disease which relates to the use of medicines; and, further, it is restricted to prescribing medicines in diseases which are not dependent for their existence on some mechanical cause, such as the presence of a mass of undigested food in the stomach, or of a stone in the bladder. To those parts of treatment which are concerned with nursing, dietetics, hygiene, the use of water in various ways, electricity, massage, &c., homœopathy, as such, bears no reference; though those physicians who have adopted it attach great importance to these therapeutic measures. Homœopathy has solely to do with the selection of drugs when these are needed for directly curative purposes. Hence the study of drugs by experiment upon healthy persons became a cardinal point—the first—in the teaching of Hahnemann.

Further, if a medicine is to be used that will produce a condition like that which it is intended to cure, it is obvious that it must be prescribed in a dose smaller than that in which it is capable of producing such a condition. During the first three or four years of his doing so Hahnemann used doses of from three to four grains of such medicines as nuxvomica and veratrum powder; of arnica powder he gave 'a few grains;' of ignatia, from three to seven

grains; and so on. As his experience in the use of medicines upon this basis increased he found that far more minute doses than these were all-sufficient, and in 1806 he writes of his giving hundredths, thousandths, and millionths of the quantities required to obtain the antipathic or allopathic action of a drug. What is the safest, surest, and best dose in which to prescribe a homœopathically chosen medicine is a question upon which there is a great difference of opinion among those who have studied the subject; there is unanimity that the dose to cure must be smaller than that which will produce a condition like that to be treated, and that different persons are susceptible to the influence of widely differing doses. The necessity for the dose being a small one is the second maxim of homœopathy. The third is that medicines must be prescribed in the form in which they were taken when 'proved'—i.e. when experiment revealed their action upon healthy persons.

To account for or explain the *modus operandi* of a homœopathically selected medicine several theories have been advanced; but so far no explanation has met with general acceptance. It is to the results of experience in employing homœopathically selected medicines, especially in epidemics notoriously attended by a great mortality under the usual methods of treatment, that those who advocate this method appeal to sustain their position. Homœopaths claim that the comparative mortality between cases treated homœopathically and otherwise in the Vienna cholera epidemic of 1836, in that of yellow fever at New Orleans in 1878, and in that of typhoid fever at Melbourne in 1887-90, and in later cases in various countries, gave overwhelming evidence for their treatment.

Another argument is drawn from the fact that Hahnemann, when appealed to in 1832 to suggest the medicines most likely to be useful in cholera, without ever having seen a case, merely from comparing the symptoms reported to him with those produced by medicines he had experimented with, named camphor, copper, and white hellebore.

Finally, homœopaths contend that the unacknowledged adoption of many of the practical results of their teaching by physicians who professedly repudiate homœopathy is an additional proof that this teaching is sound. Of these, the use of aconite in inflammatory fever is one of the most conspicuous. It was the endorsement of this statement by Dr Uwins at a meeting of the London Medical Society in 1836 that so shocked the members present as to induce them to pass a resolution precluding all reference to homœopathy at any future meeting. Other homœopathic medicines adopted by allopaths are arsenic in gastric irritation, ipecacuanha in vomiting, corrosive sublimate in dysentery, belladonna in quinsy, &c.

From the outset Hahnemann's doctrine met with determined opposition in Great Britain. By 1850, however, there were some eighty homœopathic practitioners in London; and now open adherents of this doctrine are to be found holding public health and poor-law appointments. The chief hospital where it is practised is the London Homœopathic (1850). The number of those who in Great Britain admit that they practise homœopathy has never, however, at any one time been large, and the position in Europe in most of the countries of which homœopathy has been established may be described in similar terms. Dr Hans Birch Gram introduced homœopathy into the United States in 1825, and its progress was rapid, various medical colleges rising into being for the teaching of its therapeutics. In Canada a college at Montreal grants diplomas, and homœopaths are elsewhere represented on medical councils. No one can study the history of medicine without perceiving the powerful influence homœ-

opathy has had on the general practice of the medical profession. During the first fifty years of the 19th century, while homœopathy was gradually becoming more frequently practised, the weapons commonly used against disease were of the most formidable character—bleeding by lancet, leeches, and cupping-glasses, mercurialism, purgatives, &c. From mid-century onwards, however, the method of studying the actions of drugs originally suggested and carried out by Hahnemann was adopted to a very large extent, under the designation of pharmacology; while, for practical purposes, the uses of drugs proposed by homœopaths, and set forth in their journals and published works, have, as has already been stated, been very largely followed.

See **HAHNEMANN, MEDICINE**; treatises by Mack, Burnett, Dunham, Allen, McMichael, and Wheeler; and the several homœopathic journals.

Homology. See **ANALOGUE**, and **DARWINIAN THEORY**.

Homoousian. See **ARIUS, CREEDS**.

Homoptera, a division of the insect order Hemiptera (q.v.), including aphides, cicadas, &c.

Hemosporous Ferns, a section including the great majority of ferns, distinguished not merely from Moonwort (q.v.) and Marattiaceæ, but also from the Water-ferns (q.v.) or Heterosporous Ferns. These last produce two kinds of spore, the megaspore giving rise to a prothallus which bears aegogonia, the microspore, a rudimentary prothallus with an antheridium. In the Hemosporous Ferns no such distinction is found. See **FERNS**.

Homotaxis. See **CONTEMPORANEITY**.

Hompesch, FERDINAND (1744–1805), last grand master of the Knights of Malta. See **HOSPITALLERS**.

Homs. See **HEMS**.

Honan, a fertile, thickly peopled central province of China, intersected by the dangerous Hoangho (q.v.). Area, 67,954 sq. m.; pop. 25,000,000. Kai-fung (pop. 223,000) is the capital; Ho-nan and Hwai-king are also large cities. See **CHINA**.

Honawar, a small seaport on the Malabar coast of India, is in the Bombay district of North Kanara; pop. 7000.

Hondecoeter, MELCHIOR (1636–95), the most distinguished of a family of Dutch painters, was born at Utrecht. He painted at first mainly wild animals or game, dead and alive, and latterly poultry.

Hondo. See **JAPAN**.

Honduras, a Central American republic, between Nicaragua and San Salvador and Guatemala. On the Atlantic it has a coast-line of 400 miles on the Gulf of Honduras and the Caribbean Sea, and on the Pacific one of about 60 miles along the Bay of Fonseca. Area, 44,300 sq. m.; pop. (1923) 673,000. Except for a narrow strip of swamp-land along either coast, the country is a tableland, its series of elevated plateaus broken by broad and fertile plains and valleys, or rising to mountain-ridges that reach 8000 feet; the Montaña de Selaque (10,120 feet) is the highest peak. There are no active volcanoes. The Cordilleras proper traverse the country irregularly in a north-west and south-east direction. Honduras is watered by innumerable streams, though these are seldom navigable, and then only for short distances; the Wanks or Segovia, which forms for many miles the boundary with Nicaragua, has a length of 350 miles. Roatán and the other fertile Bay Islands (q.v.), off the north coast, belong to Honduras, as well as two small islands in the Bay of Fonseca. The climate is hot on the coast, where also fever prevails; but in the highlands the temperature is

low, and in the principal towns the mean is 74° F. In the mountains heavy frosts enrust the leaves of the pine and oak forests in November and December; but snow has never been known. Generally speaking, the rainy season extends from May to November. The flora and fauna correspond closely to those of Guatemala (q.v.). Honduras is essentially an agricultural country, and cattle-raising is an extensive industry; the banana is the principal culture, followed closely by the coconut, while next in importance come coffee, rubber, tobacco. The forests, rich in mahogany and other woods, are only very partially exploited. In minerals Honduras is reputed to be the richest of the Central American republics. Silver ores, abundant in almost every variety, are mined; gold is washed principally in Olancho, and mined in one or two places; rich iron ores are found, mostly magnetic; also copper, antimony, platinum, zinc, and tin. There are beds of lignite in Gracias department, and famous opals that are second only to those of Czechoslovakia. The mineral resources have never been properly developed, however, owing to economic insecurity and to inadequate means of transport. Bananas, coconuts, cattle, coffee, mahogany, hides, silver, and gold are the principal exports. The roads of the country are for the most part poor, and the railway system is entirely inadequate. The projected inter-oceanic railway from Puerto Cortés to La Brea—an undertaking which, together with the expenses of wars, has involved the finances of the republic in chronic embarrassment—has proceeded no farther than La Pimienta and Potrerillos, a matter of some sixty miles. On the north coast are several lines owned by various fruit companies, and the lines under construction from San Lorenzo, on the Pacific, and Trujillo, on the Atlantic, to Tegucigalpa and Juticalpa respectively, would, on the junction of these last two places, form a second inter-oceanic communication.

The inhabitants of Honduras are chiefly Indians with an admixture of Spanish blood, whites and pure-blood Indians being very few. On the north coast there are many negroes, while on the Mosquito coast there is a considerable population of so-called 'Caribs' (q.v.). There are no towns of any importance, the largest being the capital, Tegucigalpa, with about 40,000 inhabitants. The ports are Amapala, on the Pacific, and Puerto Cortés or Puerto Caballos, Omoa, Tela, La Ceiba, Trujillo, Puerto Castilla, on the Atlantic. Roman Catholicism is the prevailing religion. Education, though free, compulsory, and entirely secular, is essentially backward, and the percentage of illiteracy is high. There are colleges for secondary education in the various departments, and a central institute at Tegucigalpa, where also are a national university and a military school. At Camayagua there is a school of jurisprudence. The constitution of Honduras was promulgated in 1839, was subsequently frequently amended, was largely recast in 1880 under President Soto, and was remodelled in 1894, when a new charter was proclaimed. The executive power rests with a president elected by popular vote for four years, while the legislative authority resides in a popularly elected congress, there being one deputy for every 10,000 inhabitants. The president, however, who in administration is assisted by six ministers, is for all practical purposes a dictator.

Honduras (Span., 'depths') was discovered by Columbus on his fourth voyage in 1502, and was named, it is said, from his difficulty in finding an anchorage. The first settlement was made in 1524 by a lieutenant of Cortez, one Olid, who in 1525 was removed from the governorship by his chief on his attempt to establish an independent princi-

pality. The early explorers found numerous pyramids and other remains of an ancient civilisation, as well as some of the richest mines which had yet been revealed in the New World. In 1539 Honduras was incorporated in the captaincy-general of Guatemala, and continued so till 1821, when, along with the rest of Central America, it threw off the authority of Spain, becoming in 1822 a part of the Mexican empire, in 1823 a member of the Central American Confederation, and in 1839, on the dissolution of that association, an independent republic. Thereafter for a long period Central America was the scene, now of civil and other wars, now of attempts to form new confederations. In 1877 Marco Aurelio Soto became president. Frequent outbreaks of civil war occurred between 1883 and 1903, when Manuel Bonilla gained the presidency, and succeeded in maintaining order until driven from office by revolution and by war with President Zelaya of Nicaragua. A general Central American conflict threatened, but in 1907, by a convention at Washington, the territory of Honduras was neutralised and a court established, to which it was agreed that all future Central American disputes should be submitted. This arrangement, however, collapsed in 1916, but was renewed in 1922. In 1909 Miguel Dávila, a creature of Zelaya, became president, but was displaced in 1910 by ex-president Bonilla, who had invaded the country on Zelaya's fall in Nicaragua. On Bonilla's death in 1913 Francisco Bertrand succeeded to the presidency. In 1918, during the Great War, war was declared on Germany, and in the following year a revolution saw the removal of Bertrand from the presidency, and the inauguration in 1920 of López Gutiérrez in his stead. In 1921 a new union comprising Honduras, Guatemala, and Salvador was agreed on, but collapsed before its inception. In 1924 a revolutionary rising took place in the capital.

Honduras, BRITISH. See BELIZE.

Hone, WILLIAM, a versatile and industrious English writer, was born at Bath, 3d June 1780. He had but little education, and, after some years of hopeless drudgery in London as a lawyer's clerk, at twenty started a book and print shop there, which, however, soon failed. He struggled bravely to get bread for his already numerous family by writing to various papers, started the *Traveller* (1815), and next the *Reformist's Register* (1817). He quickly made his name known throughout England by his political squibs and parodies, accompanied by the caricatures of Cruikshank. In December 1817 he was subjected to three separate trials for publishing things calculated to injure public morals and bring the Prayer-book into contempt. The prosecution was really political rather than religious. Hone was acquitted on all three counts, after defending himself with remarkable vigour and ability. Among the more successful of his later satires, all illustrated by Cruikshank, were *The Political House that Jack built*, *The Queen's Matrimonial Ladder* (for Queen Caroline), *The Man in the Moon*, and *The Political Showman*. Works that revealed much reading in obscure channels were the *Apocryphal New Testament* (1820) and *Ancient Mysteries Explained* (1823). The *Every-day Book* (1826), *Table-book* (1827-28), and

Year-book (1829) contained rich stores of information on manners and antiquities, into which most later miscellaneous writers upon folklore and popular traditions have burrowed. Yet their stout-hearted compiler at the end found himself in a debtor's jail, from which his friends extricated him to start him in a coffee-house—also a failure. In 1830 Hone edited Strutt's *Sports and Pastimes*, and contributed later to the *Penny Magazine* and the *Patriot*. In his last years he swung back to the devout theology of his mother's hearth, and even preached once. He died at Tottenham, 6th November 1842. See the Life by F. W. Hackwood (1912).

Hones. See WHEATSTONES.

Honesty (*Lunaria*), a genus of plants of the natural order Cruciferae, of which two species, natives of the south of Europe, *L. annua* or *biennis* and *L. rediviva*, have long been cultivated in British flower-gardens, on account partly of the beauty of their flowers, and partly of the curious appearance of their large flat seed-pouches (silicles), or rather their large oval membranous dissepiments, which are very persistent, resemble polished films of mother-of-pearl, and are frequently used as mantelpiece and table ornaments.

Honesty (*Lunaria biennis*) in seed.

The origin of the English name is doubtful. Some of the older English poets mention the plant as *Lunarie*—'in sorceries excelling,' for it was reckoned among herbs potent for magic.

Honey is a sweet, thick liquid produced by bees and by various other insects. The working bees gather the nectar from the nectaries of flowers, and also sweets from other sources when nectar is scarce, which they carry home to the hive in the crop or honey-bag. Here it appears to undergo a transformation, by which it becomes honey before it is disgorged into the cells of the comb. Yet the change is such that many of the distinctive characteristics of the various materials can be traced in the manufactured honey. Thus we find clover and heather honey easily distinguishable, the clover-honey being a clear white—almost greenish-white—thin variety; while that obtained from heather has a rich amber colour, and is much more viscid, so that it cannot be slung from the combs without destroying them. The flavour and colour of other flowers can also be distinctly traced in various honeys, such as that made from the flowers of the ivy and that from honey-dew, the produce of the Aphides (q.v.), which may be seen in summer in the form of a sticky liquid on the leaves of the lime

and other trees. In default of better food bees sometimes resort to this honey-dew. But it imparts a blackish hue to the honey and a disagreeable flavour.

Honey contains dextro-glucose and lævo-glucose, cane-sugar, as also gummy, waxy, and colouring matter, and essential odorous oils, along with water and a minute quantity of mineral matter and pollen. The proportion of crystallisable sugar increases with the age of the honey, so that in time it acquires a granular consistency. Exposure to light and cold increases this tendency, which is stronger in some kinds of pure honey than in others.

As an article of commerce and for human consumption honey is presented both in the comb and as run honey. The run honey is separated from the wax of which the storing cells are composed, by the centrifugal extractor, or by the more tedious and less perfect method of cutting the comb in pieces and running the honey through a bag placed near a fire. The best form of comb-honey is that which is termed virgin honey. It is contained in pure white cells of very thin wax. These cells have never been used by the bees for any other purpose than the storage of honey. When the cells have been previously used for the incubation of eggs and the development of bees through the larva stage they become discoloured and much thicker in the walls, and after repeated use in breeding they become quite black. Comb-honey in dark-coloured cells is of very inferior quality.

From the remotest times honey has been employed as an article of food. And to the ancients, who were unacquainted with sugar, it was of more importance than it now is. 'A land flowing with milk and honey' offered the highest conceivable advantages to the eastern mind. The honey of Hymettus, a mountain in Attica, and of Hybla, a mountain in Sicily, were of old held in high repute, doubtless in consequence of the wild thyme and other fragrant herbs growing upon them. The honeys of Narbonne and of Chamonix for similar reasons are now held in high estimation, as also the heather-honey of Scotland. Taken in moderate quantity, honey is nutritive and mildly laxative. Some few kinds possess poisonous properties, such as that of the Brazilian wasp and the honey of Trebizond gathered from the *Azalea pontica*. Much adulterated honey is sold: see ADULTERATION.

As a demulcent and flavouring agent honey is used in many preparations of medicine. It is also used in the preparation of several popular sweetmeats and in the manufacture of some kinds of ale. Mead is a fermented liquor made from the washings of the combs from which honey has been extracted. Large quantities of honey are annually imported into Great Britain from America, especially from California, where many large bee-farms exist. See BEE; and for the Honey Ant, see ANT.

Honey-buzzard, or BEE-KITE (*Pernis ptilorhynchus*), one of the Falconidae, allied to both kites and buzzards, but with many peculiarities, such as the thick feathering of the sides of the head down to the base of the bill. It winters in Africa, and breeds in the wooded districts of north Europe, ranging, however, as far east as China and Japan. To Britain it is usually only a visitor, and that not very commonly; but there are records of its occasional breeding here. Howard Saunders tells how collectors of 'British' specimens paid £5 for a couple of eggs, or £40 for a pair of old birds, till the breeding virtually ceased. The honey-buzzard owes its name to its habit of plundering the nests of bees and wasps for the sake of the larvæ, and apparently also the honey. It also devours grubs of many kinds and various small animals. The nest, often founded on that of some other kite, is situated on some leafy tree, and may be further

concealed by a covering of leaves, which are replaced as they wither. The eggs, usually two, are laid in June, which is late for a bird of prey. The genus includes a few other species.

Honeycomb Moth, or BEE-MOTH (*Galleria*), a genus of small moths in the same family as the Grass-moths (*Crambus*), and noteworthy for the habit some of the species have of infesting beehives. There they deposit their eggs; and the larvæ feed on the honeycomb, through which they make tunnels lined with silk. In a corner of the hive the cocoons are spun, and the metamorphoses accomplished. There are two broods in the year, and the later pupæ sleep through the winter. The best-known species, *G. mellonella*, is a satiny moth, about an inch across the wings. When they occur in numbers they are very injurious or even quite fatal to the hive. They appear to enjoy immunity from the stings. A smaller species (*G. alvearia*) is

Honeycomb Moth:

a, *Galleria mellonella*; b, larva; c, pupa; d, larva working its way through honeycomb; e, *Galleria alvearia*.

also distinguished by some authorities. Humble-bee nests are infested as well as bee-hives.

Honey-dew, a viscid saccharine exudation which is often found in warm dry weather on the leaves and stems of plants, occurring on both trees and herbaceous plants. It is often secreted from the food-canal (not from the so-called nectaries or siphons) of Aphides (q.v.) or green-flies. It may also be produced by other minute insects called Psyllids, that of *Psylla pyricola* sometimes falling like a slight shower from the trees. It may also be due to Coccids, such as *Lecanium persica*, and it is almost certain that the manna of the book of Exodus is the honey-dew secreted by *Coccus* or *Gossyparia mannifera*, which lives on the tamarisk. Whatever be its source, honey-dew often coats the surface of leaves and branches with a clammy film, to which everything brought by the atmosphere adheres, and on which moulds and other small fungi soon grow, and thus the pores of the plant are clogged and its health is impaired. Gardeners are therefore careful to wash off honey-dew with the syringe. Orange and lemon plantations sometimes suffer great injury from the abundance of honey-dew; and it has proved a cause of very great loss in the coffee-plantations of Ceylon.

Honey-eater, or HONEY-SUCKER, a name applied somewhat loosely to nectar-sucking birds, but chiefly to those of the family Meliphagidae. These are characteristic of Australia and New Zealand, and marked by their sharp, slender, curved bill and long protrusible, multiple tongue with a frayed brush-like tip, which is used in collecting the nectar. Many of them eat the insects that are attracted to the flowers, and some are partly

frugivorous. Few of them are bigger than a thrush. The family includes many interesting forms, such as the now rare New Zealand Bell-bird (*Anthornis melanura*), whose melody seemed to Cook's companions 'like small bells most exquisitely tuned;' the Australian Bell-bird (*Manorhina melanophrys*), whose note is like the tinkling of distant sheep-bells; the Friar-bird (*Philemon*), with a bare head and a suggestion of a hood, famous for the close mimetic resemblance between it and one of the orioles (*Mimeta*); and the Parson-bird or Tui (*Prothemadera nova-zealandica*), a fine songster and clever mimic, with two tufts of white feathers hanging beneath its chin like clerical 'bands.'

Honey-guide, a name applied to birds of the genera *Indicator* and *Prodotiscus*, ranked either in a special family Indicatoridæ, or, along with the barbets, in the family Capitonidæ. The headquarters are in Africa, but one species occurs in Borneo and Malacca, and another on the Himalayas—a good instance of interrupted distribution. They are plainly-coloured, small birds, the largest hardly bigger than a lark. Many observers have described the way in which the honey-guides engage man's attention and persistently lead him to a bee's nest. They eat bees, grubs, and honey, and it may be that they wish the nest broken up. It is said that they act as guides to the ratel (*Mellivora capensis*), and that they sometimes lead man to a leopard or a snake or some other exciting object.

Honey Locust Tree (*Gleditsia triacanthos*)—also known as the SWEET LOCUST and BLACK LOCUST, and in Britain as the THREE-THORNED ACACIA—a lofty and beautiful tree of the natural order Leguminosæ, sub-order Cæsalpinieæ, a native of the valleys of the Alleghanies and of the basin of the Mississippi. It is not found wild on the Atlantic coast of North America, although often planted for ornament in the vicinity of habitations. The flowers—which are small, greenish, and in spikes—have, when perfect, six stamens and one pistil, but are very generally unisexual. The leaves are twice pinnate, without terminal leaflets, the numerous small leaflets giving a peculiar gracefulness to the foliage, which is of a light shining green. The tree is furnished with numerous sharp triple spines. The pods are long, flat, pendulous, often twisted; the seeds large, brown, and enveloped in a pulp, which, when the pod is ripe, is very sweet. Sugar has been made from it, and when fermented it yields an intoxicating beverage in use among the American Indians. The honey locust attains a height of 70 or 80 feet. Trees of large size are to be seen in some parts of Britain. The wood resembles that of the Locust Tree (q.v.), or False Acacia (*Robinia pseudacacia*), but is more coarse-grained.

Honey-stone, or MELLITE, a mineral of remarkable characters and composition, found in connection with brown coal (generally accompanied by sulphur) in several places in Germany. It occurs in square octahedrons, looks like a honey-yellow resin, and may be cut with a knife. It is a mellate of alumina, consisting of mellitic acid, alumina, and water.

Honeysuckle (*Lonicera*, or, according to some botanists, *Caprifolium*, which others make a sub-genus of *Lonicera*), a genus of plants of the natural order Caprifoliaceæ. They are shrubs, often twining, and have the flowers two or more together in axillary heads. The calyx is short and 5-toothed; the corolla tubular-funnel shaped, 5-cleft, generally two-lipped; the fruit a 2- or 3-celled berry, containing one or very few seeds. The Common Honeysuckle, or Woodbine (*L. Periclymenum*), is

very abundant in woods and thickets in most parts of Britain. On account of its beautiful cream-coloured whorls of flowers, and their delicious fragrance, it is often planted in shrubberies and trained against walls. It is said to be the 'twisted eglantine' of Milton. The phenomena observed in its growth have been adduced in proof of a *perceptive power* in plants; the branches shooting out till they become unable to bear their own weight; and then, on their meeting with any other branch, twining around it, from right to left; but if they meet only with one another, twining in different directions, one to the right, and another to the left.—Very similar to this is the Perfoliate Honeysuckle

Perfoliate Honeysuckle (*Lonicera caprifolium*).
a, flower; b, fruit.

(*L. caprifolium*), with paler whorls of flowers, and remarkable for having the upper leaves united so that an opposite pair form one leaf, through the middle of which the stem passes. This peculiarity is confined to the flower-bearing shoots, and does not occur on the young runners; it is also most perfect nearest the flower. This species is a native of the south of Europe, but is now naturalised in many parts of Britain, and much planted, as, although less powerfully fragrant than the Common Honeysuckle, it flowers earlier.—There are numerous other species, natives of Europe, Siberia, and North America. The Fly Honeysuckle (*L. Xylosteum*) is an erect shrub, a native of Europe and Asia, scarcely indigenous in Britain, but common in shrubberies. Its branches are not unfrequently used in some parts of Europe for tubes of tobacco-pipes; and it is said to make good hedges in dry soils. Other erect species are not unfrequently planted in shrubberies.—The Trumpet Honeysuckle (*L. sempervirens*), called in America the Coral Honeysuckle, is a native of the southern states of North America, often planted in Britain on account of its beautiful flowers, red on the outside, and scarlet within, which, however, have no fragrance. It is a twining evergreen shrub.—The berries of the honeysuckles are nauseous.—The name honeysuckle is also given to shrubs very different from this genus, but of which the flowers abound in honey, as to species of Banksia in Australia. *Rhododendron viscosum* is called Swamp Honeysuckle in North America. See also FRENCH HONEYSUCKLE.

Honfleur, a seaport in the French department of Calvados, is situated on the southern side of the Seine estuary, opposite to Havre, from which it is 7 miles distant. It is irregularly built, dirty, and uninteresting. There is a school of hydrography, and one of its churches is a celebrated place of pilgrimage to sailors. The commerce of Honfleur, once of much greater importance than at the present time, has been absorbed in great measure

by Havre. But the harbour and its approaches were greatly improved in 1874-81, and there is still a considerable export of eggs, butter, poultry, corn, and cattle, mostly to England, and import of iron and coal, and of timber from Norway. The principal manufactures are leather, cast-metal, and refined sugar. There are also ropewalks and shipbuilding yards. Pop. 9000.

Hong-kong, or **HIANG-KIANG** ('sweet waters'), an island of southern China belonging to Great Britain, situated on the east side of the river Canton, and about 90 miles S. by E. from the city of Canton. It consists principally of a rugged ridge of granitic rocks, extending from north-west to south-east, and has an area of 32 sq. m. Barren and desolate, with scarce any traces of cultivation, the island itself presents a striking contrast with the beauty of its harbour, a magnificent sheet of water, 10 sq. m. in extent, one of the finest in the world, which stretches between the northern shore of Hong-kong and the peninsula of Kowloon on the opposite mainland. The straits that separate the two are scarcely half a mile wide on the east, but expand greatly towards the west. It is to the excellence of its harbour, to the fact that it has been made a free port (except for intoxicating liquors and tobacco), and to its being the headquarters of European finance in eastern Asia, that Hong-kong owes its importance as the principal commercial entrepôt of southern China, if not of eastern Asia. Among the principal objects of commerce are tea and silk, preserved ginger, drugs, feathers, sugar, flour, rice, salt, hemp, copper, lead, iron, machinery, woollens, earthenware, nut-oil, amber, cotton, sandalwood, ivory, betel, vegetables, live-stock, granite, and shipping-stores. Hong-kong possesses unrivalled steam communication with regular lines to Europe, India, Singapore, Australia, Japan, Canada, and the United States; and the place is the depot for an incessant flow of Chinese emigration and immigration. It is also a military and naval station of the first importance. Shipbuilding, granite-quarrying, fishing, sugar-refining, and the manufacture of tobacco, rope, and cement, are the principal industries. To the numerous government and denominational schools, the Queen's College, the College of Medicine for Chinese students, and the Technical Institute, a university was added in 1912, with faculties of medicine, engineering, and arts. Typhoons are prevalent during the months from July to October, that of 18th September 1906, when perhaps 10,000 lives were lost, being exceptionally severe. The summer is hot and generally rainy; but the island is not healthy except at certain seasons. In 1894-1900 it was ravaged by bubonic plague. The city of Victoria, the capital of the island, stretches some 4 miles along the northern shore, and from its situation on the slopes and terraces of the hills overlooking the harbour and its handsome streets and houses is justly entitled to be called one of the finest cities in the East. Here dwell all the Europeans and most of the Chinese portion of the population. Hong-kong was first occupied by Great Britain in 1841, and was secured to her in the following year by the treaty of Nanking, but the place was of small importance until in the second half of the 19th century came the great Chinese emigration to the gold-fields of Australia, and the opening up of China itself to foreign trade. On the mainland the extremity of the peninsula of Kowloon, embracing an area of 2½ sq. m., was ceded to Great Britain in 1861, and now forms part of the dependency of Hong-kong, which is a crown colony, under a governor and executive and legislative councils. For purposes of defence the British government in 1898 leased for ninety-nine

years a portion of Chinese territory behind the Kowloon Peninsula, with an area of 359 sq. m. and a pop. of 100,000. The region is under the sole jurisdiction of Great Britain, and has extensive cultivable land, on which are grown sugar, rice, vegetables, litchis, pineapples, &c. Since 1916 considerable areas have been reclaimed from the sea. The total area of the colony of Hong-kong is 391 sq. m., and the total population in 1921 was 625,166 (non-Chinese, 12,856).

Honiton, a market-town and municipal borough (1846) of Devonshire, near the left bank of the Otter, 17 miles by rail ENE. of Exeter. Four times devastated by fire between 1747 and 1797, it is a modern well-built place; but its old parish church, on a hill, contains a fine oak-screen, erected in 1482 by Bishop Courtenay of Exeter. The famous Honiton pillow-lace, a manufacture introduced here by Flemish refugees in the middle of the 16th century, is still a specialty of the district (see LACE). The beautiful vale of Honiton is famous for its butter. Honiton was disfranchised in 1868. Pop. 3000.

Honolulu, the capital of Hawaii or the Hawaiian Islands, is situated on the southern coast of the island of Oahu. It is at once the seat of government and the commercial centre of the Hawaiian territory; but it was not originally the capital, and its importance is of modern growth, being due to the fact that its harbour was the only really well-protected port in the Archipelago. The harbour, which attracted to Honolulu at first whaling vessels and subsequently traders of all kinds, is not a large one. It is entered through an opening in the coral-reef, is 150 yards wide at the entrance, and extends for rather more than a mile in a north and south direction. The town stands close to the shore, on a narrow plain at the mouth of the Nuuanu valley, which runs back between cliffs into the main range of Eastern Mountains. The Punch Bowl, and the Nuuanu Pali behind the town, are prominent vantage points, and protect the harbour from the north-east trades. Honolulu is well laid out, and is embowered in flowers and foliage, with some beautiful tropical gardens, amongst the most notable of which are those of the late Princess Likelike. There are fine public and commercial buildings, and a striking statue of King Kamehameha the Great.

Waikiki, about 4 miles out, is a favourite suburb, where surf-bathing may be indulged in to perfection. The climate, owing to the prevailing trade-winds, is very pleasant. Honolulu and its surrounding country are visited by increasing numbers each year from America, with which, as with Australia, Japan, and southern Asia, it is in excellent steamer communication. Population (1896) 29,920; (1920) 83,327. Pearl Harbour, 6 miles to the west, is a U.S. naval station; its port was greatly improved in 1903-5, and there is a dry dock (1919) capable of accommodating the largest warships. Since 1911 also, Honolulu, Pearl Island, and other places in Oahu have been strongly fortified by the government of the United States, with a view to protecting the Pacific coast, and to ensuring control of the Panamá Canal. See also HAWAII.

Honorarium. See FEES, OFFERTORY.

Honorius, **FLAVIUS**, second son of the Roman emperor, Theodosius the Great, was born in 384. On the death of his father the empire was divided between him and his brother Arcadius, Honorius receiving the western half, with Rome as his capital. Being only ten years old, he was put under the guardianship of Stilicho (q.v.), who was the *de facto* ruler of the western empire until 408. After the death of Stilicho, who had been the strong bulwark of western Rome against the

barbarian invasions, Alaric the Goth overran Italy, and besieged Rome, and took it in 410. A new champion of the empire arose in Constantius, who was appointed the colleague of Honorius in the consulship, and received in marriage (417) the hand of his sister Placidia, along with a share in the empire. But Constantius did not long enjoy his good fortune, as his death took place a few months after. Thereafter things went from bad to worse in the empire, and the weak Honorius lost his hold of the fair provinces beyond the Alps, whilst Africa was a seething caldron of revolt and civil war. The first emperor of the West died in 423 at Ravenna, which he had made his capital in 403. See J. B. Bury's *History of the Later Roman Empire*.

Honorius I., Bishop of Rome from 625, was born of a consular family in Campania. His name is connected with the history of the paschal controversy in Ireland and with that of the early Anglo-Saxon Church. During his pontificate the bishopric of York was elevated to the rank of an archbishopric, and the festival of the Elevation of the Cross was instituted. At the height of the Monothelite (q.v.) controversy Honorius, at the suggestion of Sergius, patriarch of Constantinople, abstained from condemning the new doctrines, with the result that, pope though he was, he was, after his death in 638, stigmatised as a heretic at the Council of Constantinople (680); on this account an historical importance has attached to his name in questions of papal infallibility. Some letters of his are preserved in Labbe's *Collectio Conciliorum*, vol. iii.

Honour, MAIDS OF. See HOUSEHOLD.

Honourable, a title given in the United Kingdom to the younger sons of Earls, and all the children of Viscounts and Barons; to Maids of Honour, Lords of Session, the Supreme Judges of England and Ireland. For the persons entitled to be styled 'Honourable,' 'Most Honourable,' and 'Right Honourable' respectively, see ADDRESS (FORMS OF). In America custom attaches the title of Honourable to the names of governors of states, judges, members of congress, and other public functionaries.

Honours, MILITARY. See SALUTES; and for Honours of War, see CAPITULATION.

Hontheim, JOHANN NIKOLAUS VON was born at Treves, 27th January 1701. He was educated in the Jesuit school of his native city, studied canon law at Louvain, and afterwards taught it for ten years at Treves, of which see he became suffragan bishop in 1748. He is the author of two works on the history of Treves, *Historia Trevirensis Diplomatica* (3 vols. 1750) and *Prodromus Historiæ Trevirensis* (2 vols. 1757). But he is chiefly memorable for a theological essay in Latin, *On the State of the Church and on the Legitimate Authority of the Roman Pontiff* (1763). This he published under the *nom de plume* of Justinus Febronius, whence the system of church government which the work propounds has been called Febronianism. His scheme may be described as an exaggerated form of Gallicanism, with the democratic element of congregationalism superadded. The work was condemned by Clement XIII. immediately after its appearance. When it became known in 1778 that Hontheim was the author, Pius VI. required from him a retraction of his doctrines. But three years later in his *Commentarius* Hontheim repeated his old views. He died at Montquintin in Luxembourg, September 2, 1790. See O. Mejer, *Febronius* (Tübingen, 1885).

Honthorst, GERARD VAN, Dutch painter, born at Utrecht on 4th November 1590, and died there on 27th April 1656. He was a member of the painters' guild of Utrecht (1622-37) and of that of

The Hague (1637-52). He twice visited England (1620 and 1628), and painted portraits of the royal family and an allegory (now at Hampton Court). He also found patrons in Elizabeth of Bohemia and the princes of Orange. His best pictures are imitations of Caravaggio, whose works greatly influenced him whilst studying in Rome; he was particularly fond of painting interiors dimly illumined by lamps or candles. The 'Liberation of St Peter,' the 'Martyrdom of St John,' the 'Musician,' the 'House in the Wood,' and the portraits of Mary de' Medici, the king and queen of Bohemia, and the Duke of Buckingham may be taken as representative of his skill.—His brother WILLIAM (1604-66), an historical and portrait painter, worked for the court of Berlin from 1650 to 1664.

Honvéd ('Land-defenders'), the name given in Hungary under the earlier kings to the national champions. In the summer of 1848 the term was revived, and applied first to the revolutionary armies, and after the organisation of the Hungarian landwehr in 1868 to that body of men.

Hooch, or HOOGH, PIETER DE, a Dutch artist, born c. 1629, who died at Amsterdam c. 1678. A member of the Painters' Guild of Delft in 1655, he was alive in 1677, as is shown by the date on his pictures, but he died probably early in the next year. Although we know little about his private life, some two hundred and fifty pictures remain to show us that he was one of the most charming artists Holland has produced, and one of the greatest painters of sunshine in all its infinite gradations the world has ever seen. In his early work he liked a scene flooded with bright light, such as 'The Interior of a Dutch House' and 'The Music Party,' but it is in the more subtle suggestiveness of his later style that he excels. In 'The Mug of Beer,' 'A Girl Reading,' and 'The Card Party,' his fullest cunning in the concentration of sunlight is displayed. Each object falls into proper position by the clever grading of light, and there is a joyous serenity irradiating the whole. There are examples of his work in the National Gallery and in many private collections in England. See Hofstede de Groot's *Catalogue raisonné* (1907).

Hood. The academic hood is a modification of the monk's cowl. The right to wear hoods is bestowed by universities and by certain chartered colleges, and the value and source of the wearer's degree are indicated by the material, shape, and colour of the hood. Bachelors' hoods are commonly distinguished from those of Masters and Doctors by an edging of white fur.

Hood, MOUNT. See CASCADE RANGE.

Hood, ALEXANDER (1727-1814), Lord Bridport, admiral, was the younger son of the vicar of Thorncombe, near Axminster, and younger brother of the more famous Viscount Hood. The date of his entry into the service was 1741. Both the Hoods entered under the patronage of Admiral Smith, called 'Tom of Ten Thousand.' There has been some confusion between the exploits of the brothers—thus a victory at Hyères, in command of the *Antelope* in 1757, has been erroneously attributed to the younger brother. In 1746 Alexander Hood became lieutenant, and in 1756 attained the command of the *Prince George* (90 guns). After service in the Mediterranean and Channel under Saunders and Hawke, he again distinguished himself in 1761, while in command of the *Minerva* frigate (32 guns), by recapturing from the French the *Warwick*, a 60-gun ship, formerly English, but now armed with 34 guns. During the war of American independence he served much under Keppel, Rodney, and Howe in the Channel and the Strait of Gibraltar. In the

notorious Keppel court-martial he appeared not wholly to his credit. During the French revolutionary war he served in the Channel with distinction, having a share in 1794 in the 'glorious first of June' off Ushant, and afterwards in command of blockading squadrons. He attained flag rank in 1780, and was made Baron Bridport in 1796, and Viscount Bridport in 1800. See the *Naval Chronicle*, vol. i.; Keppel's *Life of Lord Keppel*.

Hood, HORACE LAMBERT ALEXANDER (1870-1916), admiral, son of the fourth Viscount Hood, served on the Nile and in Somaliland, and went down with the *Invincible* in the battle of Jutland.

Hood, JOHN BELL, an American general, was born at Owingsville, Kentucky, 1st June 1831, graduated at West Point in 1853, and saw some service against the Indians. He entered the Confederate army, commanded a brigade, and was severely wounded at Gaines's Mill, at Gettysburg, and at Chickamauga, where he lost a leg and was made lieutenant-general. He commanded a corps under General J. E. Johnston in the retreat to Atlanta, and in July 1864 succeeded him in command of the army. On September 1 he was compelled to evacuate the city, and leave the road free for Sherman's march to the sea. He yet made a bold attempt to cut Sherman's communications, and, though worsted at Franklin on November 30, pushed as far north as Nashville; but here he was again defeated by Thomas on December 16, and at his own request he was relieved of command. He died in New Orleans, 30th August 1879. His personal experiences were published posthumously as *Advance and Retreat* (1880).

Hood, ROBIN. See ROBIN HOOD.

Hood, SAMUEL, Viscount Hood of Whitley, admiral, elder brother of Lord Bridport, was born at Thorncombe in 1724, and entered the navy in 1740 under Commodore Smith on board the *Romney*. He was promoted lieutenant in 1746, commander in 1754 after seeing good service, and post-captain in 1756. While in that rank he commanded the *Vestal* frigate of 32 guns, in which he took a French frigate of equal force after a fiercely-contested action. After much other service at sea he was made commissioner of Portsmouth dockyard in 1778. In 1780 he was promoted to flag rank, and sailed almost at once in command of a squadron to reinforce the North American and West Indian stations under the orders of Rodney. He remained in these waters till peace was signed; and, as they were the great scene of the naval war, he had many opportunities of distinguishing himself. In April 1781 he fought an action with De Grasse off the Diamond Rock, and in July of the same year—Rodney having gone on leave—was engaged under Admiral Graves in the battle off the Chesapeake. In January 1782 he was back in the West Indies, and showed himself a tactician of the most brilliant kind by the masterly series of manœuvres by which he outwitted De Grasse in the actions fought in the Basseterre Roads off the island of St Kitts. When Rodney arrived to take command with the reinforcements from England, Hood became again his second in command. In that rank he had a conspicuous share in the winning of the decisive victory of the 12th April, commonly called the battle of Dominica. The brunt of the preliminary action of the 9th fell on his division, and on the 12th he led the rear of the English line. For his services on this occasion he was made Baron Hood of Catherington in the Irish peerage. In 1784 he stood against Fox for Westminster, and was elected. He became a Lord of the Admiralty in 1788. When the great revolutionary war broke

out in 1793, he was appointed to the Mediterranean. In that position he directed the occupation of Toulon and the subsequent operations in the Gulf of Lyons and on the coast of Corsica. He hauled down his flag in 1795. In 1796 he was made Viscount Hood in the peerage of Great Britain, and he died at Bath, 27th June 1816. Lord Hood had the reputation of being a consummate tactician. Nelson, who served under him, considered him the ablest of our admirals in the early years of the war, and it is said that a plan he drew up for an attack on a French fleet at anchor, which was prevented by foul winds, had some share in inspiring the plan of attack adopted in the battle of the Nile. See *Naval Chronicle*, vol. ii. pp. 1-46; Mundy's *Rodney*; Nelson's *Letters and Despatches*; James's *Naval History*; Hood's *Letters*, ed. Hannay (Navy Rec. Soc., 1895).

Hood, THOMAS, poet and humorist, was born on the 23d of May 1799, at No. 31 the Poultry, in the City of London, where his father carried on the business of a publisher in partnership with a Mr Vernor. Thomas Hood the elder was a native of Scotland, the son of parents in humble circumstances, near Errol, on the north bank of the Tay, between Perth and Dundee. Originally bound apprentice to a bookseller in Dundee, he had proceeded to London, and finally became member of the firm just mentioned. He was himself a man of some turn for authorship, and even wrote a couple of novels now forgotten, so that his more distinguished son was born, as he expressed it, 'with ink in his blood.' The elder Hood married the sister of Mr Sands, an engraver of some repute, from whom Thomas Hood probably received his first impulse towards art and artistic associations. To Thomas Hood, the publisher, and his wife, were born a family of six children, two sons and four daughters, of whom Thomas was the second son. There was a tendency to consumption on the mother's side, for the malady was fatal to the elder son James and to two of the daughters, and in the sequel to Mrs Hood, and was at the root of those complicated disorders which made the life of Thomas Hood 'one long disease.' The father contracted a chill while nursing his elder son, and died after a few days' illness in 1811, when Thomas was only twelve years old, leaving the widow and remaining children in reduced circumstances.

In his *Literary Reminiscences*, a discursive autobiography written by Hood in 1839, and published in the first series of *Hood's Own*, he tells us that he owed his earliest instruction to two maiden ladies, of the name of Hogsflesh, who had a small school in Token House Yard; that he was then sent to a suburban boarding-school (the 'Clapham Academy' of his famous Ode), and ultimately to a day-school at Clerkenwell, where his mother went to reside after her husband's death. His education, ordinarily so called, closed at this point; and after the age of thirteen or fourteen his own keen and catholic love of reading was the foundation of that singular versatility and resource which marked both his poetic and his humorous vein. For the next two years of his life there is some uncertainty as to his pursuits. According to his own account, he was now placed, through the influence of a friend of the family, in a merchant's counting-house in the city, but his health proving unable to stand the confinement to the desk, he was shipped off to Dundee, where relations of his father were living, among whom he resided for some three years, from 1815 to 1818.

These three years were important in Hood's life. The threatened consumption was for a time warded off—the boy led the healthiest of outdoor lives in fishing and boating—he had ample leisure besides

both for reading and sketching, and he began to practise his pen both in verse and prose in the pages of local newspapers and magazines. In 1818 he returned to London with his health apparently re-established, and entered the studio of his uncle, the engraver. After a short apprenticeship of only two years he began to work on his own account, until, the literary instinct beginning to wax far stronger than the graphic, he seems to have discovered where lay the true field for his genius. About the same time the *London Magazine*, losing its editor, John Scott, and passing into the hands of Taylor and Hessey, Thomas Hood, then a young man of two-and-twenty, was appointed sub-editor.

Nothing more propitious for Hood's genius could have happened. It emancipated him for ever from the engraver's desk, the drudgery and constraint of which were seriously affecting his health, and it threw him at once into a society of writers best fitted to call forth all that was best in him. He now found himself in daily companionship with such men as Procter, Cary, Allan Cunningham, De Quincey, Hazlitt, and, above all, with Charles Lamb, with whom a close friendship sprung up, destined to be one of the best influences of Hood's literary life. It was, however, the intimacy with John Hamilton Reynolds, whose sister he married three years later, that more than all the rest served to encourage and train Hood's poetic faculty. John Keats had died early in 1821, the year that Hood joined the magazine, and it does not appear that they ever met; but Reynolds had been the close friend and disciple of Keats, and Hood passed at once under the same fascinating influence. Between July 1821 and July 1823, besides other and lighter contributions to the *London*, Hood wrote and published in the magazine some of the finest of what may be called the poems of his Keatsian period—*Lycus the Centaur*, the *Two Peacocks of Bedford*, the *Ode to Autumn*, and others—poems which have never materially increased Hood's fame with the ordinary reader, chiefly because Hood the humorist appeals to a larger audience than Hood the poet, and the world is always indisposed to allow credit to a writer for gifts of very opposite kinds. And although in the class of subjects, and in the very titles of these poems, as well as in turns of phrase and versification, the influence of Keats is unmistakable, the poems show quite as markedly the result of an ear and taste formed upon a loving study of the narrative poems of Shakespeare. And 'over all there hung' a tender melancholy observable in all Hood's serious verse, engendered in a personality on which from the beginning there rested the shadow of impending fate. In spite of real and original poetic quality, these poems, issued anonymously, failed to attract notice, and when in 1827 he produced them with others of still finer quality in book-form, the volume fell all but dead from the press.

A different fate attended an earlier venture in 1825, when Hood and his brother-in-law Reynolds published (also anonymously) the little volume entitled *Odes and Addresses to Great People*. While writing serious poetry in the *London* it had fallen to Hood's lot to act as 'comic man' or humorous chorus to the magazine, and as such to invent facetious answers to correspondents, real or imaginary. Among these he had inserted a burlesque *Ode to Dr Kitchener*, exhibiting a verbal wit of quite different flavour from the ordinary. The success of this trifle seems to have suggested a collection of similar odes, to which Reynolds contributed a few. But Hood's was far the more conspicuous share, revealing a wealth of humorous ingenuity that at once attracted notice. Coleridge wrote, attributing the book to Lamb, as the only writer he knew capable of the achievement. The

book passed rapidly through three editions, and practically determined the chief occupation of Hood for the remainder of his short life. His musical melancholy verse had brought him no recognition. His first facetious efforts had gained him an audience at once. From that day forth the vein thus opened was to be worked, in health and in sickness, with the grain and against the grain, for twenty years of anxiety and struggle.

For Hood had married in 1825 contrary, it is to be feared, to all counsels of prudence. The marriage was one of truest affection, but it could hardly have been acceptable to Mrs Hood's family, for Hood had no means of support but his pen, and his health was already matter of serious anxiety. The marriage soon produced strained relations with the Reynoldses, and in the end a complete estrangement from Hood's early friend and brother-in-law. The *Odes and Addresses* were followed in 1826 by the first series of *Whims and Oddities*, where Hood first exhibited such graphic talent as he possessed (he said of himself that, like Pope's 'tape-tied curtains,' he was 'never meant to draw') in these *picture-puns* of which he seems to have been the inventor. A second series of *Whims and Oddities* appeared in 1827, dedicated to Sir Walter Scott, followed without delay by two volumes of *National Tales*, the least characteristic and noticeable of Hood's writings. In 1829 he edited *The Gem*, one of the many fashionable annuals then in vogue—a remarkable little volume, for besides Charles Lamb's 'Lines on a Child dying as soon as born,' written on the death of Hood's first child, it gave to the world Hood's *Eugene Aram*, the first of his poems showing a tragic force of real individuality.

Hood and his wife, who passed the first years of their married life in Robert Street, Adelphi, left London in 1829 for a cottage at Winchmore Hill, a few miles north of the metropolis, where he schemed the first of those comic annuals which he produced yearly and single-handed from 1830 to 1839. In 1832 he left Winchmore Hill for an old-fashioned house at Wanstead, in Essex, forming part of the old historic mansion, Wanstead House, where the romantic scenery of the park and neighbourhood furnished him with a background for his one novel, *Tynney Hall*, written during the next two years, and published in three volumes in 1834—a story of a conventional melodramatic type, with an underplot of cockney life and manners, not without many touches of Hood's peculiar charm, but on the whole a failure. He never repeated the experiment of prose romance.

In 1834 the failure of a publisher plunged Hood into serious money difficulties by which he was hampered for the rest of his life. After the birth of his second child, a son, in January 1835, and the dangerous illness of Mrs Hood which followed, the family went abroad and settled for two years at Coblenz on the Rhine, and for the next three years at Ostend. During these five years Hood, struggling against the slow progress of a fatal disease, continued to produce his *Comic Annuals* and other lighter matter, and schemed his *Up the Rhine*, a humorous account of the proceedings of an English family in Germany, told in letters, and too obviously imitated from *Humphrey Clinker*. This, when published in 1839, at once hit the public taste, but seems to have brought little profit to its author, who, apparently destitute of all business faculty, suffered throughout his career from the misfortunes or the superior sagacity of his publishers. The sufferings of Hood during these five years were very terrible, and are only hinted by his son and daughter in their memoir of their father. In an unpublished letter to his wife in April 1840, written during a temporary visit to

England from the house of his generous friend, the first Charles Wentworth Dilke, he writes: 'I find my position a very cruel one—after all my struggles to be, as I am, almost moneyless, and with a very dim prospect of getting any, but by the sheer exercise of my pen. What is to be done in the meantime is a question I ask myself without any answer but—Bruges jail. At the very moment of being free of Bailey, am I tied elsewhere, hand and foot, and by sheer necessity ready to surrender myself that slave, a bookseller's hack!'

By the kindness of friends Hood was enabled to return to England, with security from his creditors, in 1840. Disease of lungs and heart was now so far advanced that the fatal issue was only a question of time, but he continued to struggle on bravely and cheerfully for five years longer. In 1841 he was offered by Colburn the editorship of the *New Monthly Magazine* at a salary of £300 a year, a post which he filled for two years, when, a difference arising with the proprietor, he resigned the editorship, and in January 1844 started a new periodical of his own, *Hood's Monthly Magazine*, destined to be his last literary venture. Meantime in the Christmas number of *Punch* (1843) had appeared the 'Song of the Shirt'; and in *Hood's Magazine*, during its brief career, there followed the 'Haunted House,' the 'Lay of the Labourer,' and the 'Bridge of Sighs,' proving that, as the darkness of his own prospects deepened, the sympathies with his kind deepened also, and quickened his finest genius. Only a few months after the starting of the magazine a notice to the subscribers had to tell that the health of the editor was rapidly failing. Towards the end of the year his friends used their interest with the government of the day, and in November Sir Robert Peel wrote announcing a pension to Mrs Hood on the civil list of £100 a year. In the number of the magazine for February 1845 appeared Hood's last contribution, the touching lines, prophetic of his approaching end, beginning:

Farewell life—my senses swim,
And the world is growing dim,

and ending:

O'er the earth there comes a bloom,
Sunny light for sullen gloom,
Warm perfume for vapours cold—
I smell the rose above the mould!

After three more months of increasing pain and distress, Thomas Hood died at Devonshire Lodge, Finchley Road, on the 3d of May 1845. He was buried in Kensal Green Cemetery. His devoted wife, broken in health with the long attendance on her husband, survived him only eighteen months.

Hood produced in twenty-four years an amount of prose and verse of which at least one half the world might willingly let die. Of the other half, all the serious poetry is remarkable, and a small portion of first-rate excellence. Lyrics such as the 'Song of the Shirt,' the 'Bridge of Sighs,' 'Eugene Aram,' the song beginning 'I remember, I remember, the house where I was born,' and the 'Ode to Melancholy' are of an assured immortality. His humorous verse—and in the best of it, as in 'Miss Kilmansegg,' are often blended poetry, pathos, and even real tragic power—is of a kind that Hood absolutely created. Not only was he the most prolific and successful punster that ever used that form of wit, but he turned it to purposes of which no one had ever supposed it capable. It became in his hands the most natural and obvious vehicle for all his better gifts. The truth is, he brought to it the transfiguring power of real imagination, and, instead of its degrading whatever object it touched, in his hands it ministered to the noblest ends. Even in the 'Song of the Shirt,' when his deepest sympathies were involved, he uses the pun with

almost magical effect, as where the poor needlewoman, confined to her squalid garret when all nature is beckoning her forth, exclaims:

And underneath my eaves
The brooding swallows cling,
As if to show me their sunny backs,
And *twit* me with the spring!

It was Hood's misfortune that the necessity of writing for bread compelled him to write constantly below his better genius. But he has left sufficient to found a durable fame as a writer of rare individuality, who, using a discredited method, made it delightful by the imagination of a true poet and the humanity of a lover of his kind.

[For his early life see his own *Literary Reminiscences*, first published in *Hood's Own*. The memoir by his son and daughter is unsatisfactory. A. Elliot's *Hood in Scotland* (1885) is useful. W. Jerrold's *Thomas Hood, his Life and Times* (1907), is the first full Life. A complete edition of Hood's works, prose and verse, was edited by his son and daughter in 1862 in 7 vols. In 1897 Canon Ainger edited Hood's serious poems and a selection from his humorous ones, in 2 vols. And W. Jerrold issued a one-volume edition in 1906.—Hood's eldest surviving son, TOM HOOD (baptised Tom, not Thomas, 1835-74), published poems, novels, and humorous serials, served in the War Office, and in 1865 became editor of *Punch*.]

Hoofs of horses are maintained in the best condition if left untouched by the rasp and knife (see HORSESHOEING), and kept clean by being washed with cold water; all other applications are injurious and destroy the toughness of the 'horn surface.' Brittleness of the hoof, which is a fruitful source of cracks and Corns (q.v.), may be remedied by placing the feet for several hours daily in thick woollen swabs, kept cool and moist by frequent applications of cold water, and by encouraging a more healthy growth of horn by occasional mild blisters round the coronary band. Cracks, or sand-cracks, as they are termed, mostly occur amongst horses much upon the road, cause lameness, and constitute unsoundness. When serious and recent, poulticing, thinning away of the crust about the crack, and perfect rest are essential. After the earlier heat and tenderness are removed a hot iron should be drawn at right angles to the crack, both above and below, so as to separate the diseased from the sound horn; and a piece of strong wire put through the horn at each side of the crack and fastened like a rivet is a very useful method of treatment. Waxed thread or tarry rope should be wound round the hoof, and a sound growth of horn stimulated by a blister round the coronet. The horse's hoofs are too hard and coarse to be employed for the making of the better class of combs and buttons. They are, however, largely used by manufacturers of prussiate of potash and artificial manures. See FOOT.

Hoogh, PIETER DE. See HOOCH, PIETER DE.

Hooghly. See HÚGLI.

Hoogstraten, SAMUEL DIRKSZ VAN (c. 1627-78), a Dutch artist, who studied first under his father, Dirk van Hoogstraten, and then under Rembrandt. He painted portraits in the style of the latter, but later on turned to landscape work reminiscent of Pieter de Hooch. His works are rare, as he was a master of many activities. Among his best-known pictures are 'A Lady Walking in a Courtyard,' 'The Jew,' and 'The Inner Court of a Fortress.'

Hook. See FISH-HOOK. For the HOOK (HOEK) OF HOLLAND, see ROTTERDAM.

Hook, JAMES CLARKE, painter, was born in London on 21st November 1819. He entered as a student of the Royal Academy in 1836, gained the first medals in the Life and Painting Schools in 1842, and in 1845 was awarded the travelling

studentship of the Royal Academy for 'Rizpah watching the Bodies of the Sons of Saul.' His pictures, mostly of scenes from Italian history, were romantic in feeling, dramatic in treatment, and brilliant in colouring. In 1850 Hook was elected A.R.A., and ten years later R.A. In the meantime he had begun to work at subjects connected with the lives of the people, more especially pieces illustrating seafaring life. His powers in this line of study, his most characteristic and his best, are illustrated by the 'Ship-boy's Letter,' 'Tickling Trout,' 'A Mermaid,' amongst many others. Hook, who was also a skilful etcher, died 16th April 1907.

Hook, THEODORE EDWARD, playwright, punster, and practical joker, was born 22d September 1788, second son of the Vauxhall composer, James Hook (1746-1827), by his first wife, the beautiful Miss Madden, who died in 1802. His elder brother, Dr James Hook (1771-1828), became in 1802 chaplain to the Prince of Wales, in 1825 Dean of Worcester, and was himself the author of a couple of novels. Theodore's education was almost limited to a year at Harrow and matriculation at Oxford; but while yet a minor he achieved celebrity as the author of thirteen successful comic operas and melodramas (1805-11), as a punster and matchless *improvisatore*, and as a practical joker—his greatest performance the Berners Street Hoax (1809), which took in the Lord Mayor, the Duke of Gloucester, and hundreds, thousands of humbler victims. Such talents claimed recognition, and in time the 'little pet lion of the green-room' gained the *entrée* of very high society. The Prince Regent himself remarked that 'something must be done for Hook; and in 1812 that something was found in the post, worth £2000 a year, of treasurer to Mauritius. There Hook fared gloriously, until in 1818 a grave deficiency was detected in the public chest; he was arrested and sent, almost penniless, to England. An acquaintance, meeting him at St Helena, said, 'I hope you are not going home for your health.' 'Why,' answered Hook, 'I am sorry to say they do think there's something wrong in the chest.' Himself he ascribed the 'unfortunate defalcation' to a black clerk, who had committed suicide; anyhow, though criminal proceedings were dropped, in 1823 he was pronounced a crown debtor for £12,000, and was again sold up and arrested. In 1825 he was released from the King's Bench, but not from the debt; however, he made no effort to discharge it. Meanwhile, in 1820, he had started the Tory *John Bull*, whose chief aim was to vilify Queen Caroline, and which in its palmy days brought him fully £2000 per annum. *Sayings and Doings* (9 vols. 1824-28) yielded other £4000, and nine more three-volume novels followed between 1830 and 1839—*Macwell*, the half-autobiographical *Gilbert Gurney*, *Jack Brag*, &c.—four of them first appearing in the *New Monthly Magazine*, of which Hook was editor from 1836. So he lived for a time in great style; and even after debt drove him from St James's (1831) he still dined, dined, drank, and made sport in clubs and titled houses, whilst the woman he had betrayed, the mother of his five children, was left to the loneliness of the cottage at Fulham. Shakespeare has nothing more pitiful than Hook's words to the friend who had caught him in deshabille: 'Well, you see me as I am at last—all the bucklings, and paddings, and washings, and brushings dropped for ever—a poor old gray-haired man, with my belly about my knees.' He was only fifty-two then, and a week or two later he died, 24th August 1841. He is buried in Fulham churchyard.

See the *Life* by Barham (a son of 'Ingoldsby'; 1849), Lookhart's *Quarterly* article (reprinted 1861), and the *Life* prefixed to the *Choice Humorous Works* (1902).

Hook, WALTER FARQUHAR, ecclesiastical historian, was born in London in 1798, son of Dr James Hook, afterwards Dean of Worcester. He was educated at Winchester and Christ Church, Oxford, took orders in 1821, and, after holding some minor preferments, was appointed vicar of Leeds in 1837. Here, mainly by his energy and enthusiasm, no fewer than twenty-one new churches were built in Leeds, as well as twenty-three parsonages and twenty-seven schools, while the parish church was rebuilt at a cost of £28,000. In 1859 Hook was made Dean of Chichester by Lord Derby. His leanings towards Tractarianism brought him no little unpopularity; but throughout life he maintained a high ideal of devoted churchmanship. He died 20th October 1875. A memorial church at Leeds, which cost £25,000, and was designed by Sir G. G. Scott, was consecrated in 1880.

Dean Hook's works are *An Ecclesiastical Biography, containing the Lives of Ancient Fathers and Modern Divines* (8 vols. 1845-52); *A Church Dictionary* (8th ed. 1859); *The Cross of Christ* (1873); *The Church and its Ordinances* (4 vols. 1876); and *Archbishops of Canterbury* (12 vols. 1860-76). See his *Life and Letters*, by Dean Stephens (2 vols. 1878; new ed. 1896).

Hookah (from Arabic *hugga*, through the Hindustani; the Persian *kalyūn*; also called Nargileh, from Persian *nārgīl*), the water tobacco-pipe of Arabs, Turks, Persians, Hindus, and other orientals. It consists of a bowl for the tobacco, a water-bottle, and a long flexible tube ending in the mouthpiece. A wooden tube leads from the bottom of the head or bowl down into the water in the bottle, and the flexible tube is continued downwards by a stiff tube into the space above the water in the bottle. Thus the smoke is cooled before it reaches the mouth of the smoker. Many of these pipes are beautifully decorated, or even encrusted with gems. The *hubble-bubble* of India (named from the sound produced) is a similar but simpler water-pipe, made of a coconut filled with water, and two short wooden tubes at right angles, one going into the water, the other merely passing inside the top of the shell.

Hooke, ROBERT, an English natural philosopher, born at Freshwater, Isle of Wight, July 18, 1635, and educated under Busby at Westminster, and at Christ Church, Oxford. He enjoyed the patronage of the Hon. Robert Boyle, and helped him to construct his air-pump. In 1662 he was appointed curator of experiments to the Royal Society, and in 1677 became its secretary; in 1665 professor of Geometry in Gresham College, London; and after the great fire of 1666 he acted as surveyor during the works, and thus accumulated several thousand pounds, which he hid away in an old iron chest. He died at Gresham College, March 3, 1703. Hooke was a man of extraordinary inventive genius, and has justly been considered as the greatest of philosophical mechanics; the wonderful sagacity, nay, almost intuition, he showed in deducing correct general laws from meagre premises has never before or since been equalled. There was no important invention by any philosopher of that time which was not in part anticipated by Hooke. His theory of gravitation subsequently formed part of Newton's; he anticipated the invention of the steam-engine, and the discovery of the laws of the constrained motions of planets. Among his own completed discoveries are the law of the extension and compression of elastic bodies, '*ut tensio sic vis*,' the simplest theory of the arch; the balance-spring of watches and the anchor-escapement clocks; the permanency of the temperature of boiling water. The quadrant, telescope, and microscope are also materially indebted to him. Crooked in his person,

he was upright in character, although solitary and penurious in his habits. His controversies with Huygens, Hevelius, and others brought him but little credit.

Hooker, MOUNT, a peak in the Canadian Rockies, 10,500 feet high, situated on the east boundary of British Columbia.

Hooker, JOSEPH, an American general, was born at Hadley, Massachusetts, 13th November 1814, graduated at West Point in 1837, and served with distinction in the war with Mexico, gaining the brevets of captain, major, and lieutenant-colonel, and his captain's commission. In 1853 he retired from the army, and bought a farm in California; but in 1861 he offered his services to the Union government, and was at once appointed a brigadier-general of volunteers, and major-general in 1862. He commanded a division of the 3d corps in the Peninsular campaign, and won for himself, by his coolness and gallantry, the nickname of 'Fighting Joe.' In the battles of June 1862, during the famous 'change of base,' his division rendered important services; and it was his defeat of Ewell (August 27) that compelled the enemy to evacuate Manassas. Advanced to the command of the 1st corps, he gallantly carried the position on the right of the gap at South Mountain; and he opened the battle at Antietam, where he was wounded, and won his promotion to the grade of brigadier-general in the regular army. He commanded the centre grand division in Burnside's unsuccessful attack on Fredericksburg in December 1862; and in January 1863 he succeeded him in the command of the Army of the Potomac. With this force (about 120,000 men) he was confident of effecting Lee's destruction; and about the end of April, throwing a detachment of 30,000 men across the Rappahannock below Fredericksburg, he crossed at the fords above with his main body, and marched through the Wilderness to near Chancellorsville, where he awaited Lee's attack. The Confederate troops numbered barely 50,000, but the greater part of this force, under Jackson (q.v.), turned the National flank, and, attacking the rear on May 2, threw part of Hooker's army into confusion. On the following day an impetuous attack by the whole Confederate line drove Hooker from the field, and he withdrew to the north side of the river. This defeat and retreat were regarded at headquarters as inexcusable; and, in spite of his skilful management of his army when Lee invaded Pennsylvania, he was superseded by Meade before the end of June. In November, with the 20th corps, he gallantly carried Lookout Mountain, and took part in the attack on Missionary Ridge. He accompanied Sherman in his invasion of Georgia, and served till the fall of Atlanta. He was breveted major-general in the regular army in March 1865, and in 1868, having become incapacitated by paralysis, retired with the full rank of major-general. He died 31st October 1879. Unfortunate in his one separate command, Hooker still retained too much self-esteem to be altogether a model lieutenant; yet this failing has been nearly forgotten in the memory of his personal bravery, his skill as an organiser, and his undoubtedly important services.

Hooker, SIR JOSEPH. See under HOOKER (SIR WILLIAM).

Hooker, RICHARD, the greatest of English philosophical theologians, was born in or near the city of Exeter about the end of March 1554. At an early age he showed a 'quick apprehension of many perplexed parts of learning,' and through the influence of his uncle, John Hooker or Vowel (1525-1601), chamberlain of the city, was brought under the notice of Jewel, Bishop of Salisbury,

and sent, partly at his expense, to his own college, that of Corpus Christi, Oxford, where Walton tells us he was admitted a clerk in 1567. After his patron's death in 1571 he was befriended by Sandys, Bishop of London, who committed his son Edwin to his care. Another pupil was George Cranmer, grand-nephew of the archbishop, and both became famous men, and remained his constant friends in later life. In his nineteenth year Hooker became scholar of his college, graduated M.A. in 1577, and was soon after admitted Fellow. His progress in learning is seen by his intimacy with Henry Saville, and by his being chosen in 1579, in the illness of the Hebrew professor, to read the lecture. Three months later Walton tells us that he was for a short time expelled by the vice-president for some forgotten college quarrel, along with his tutor and friend, Dr John Rainolds, but soon after restored. After about three years' residence he took orders, and ere long was appointed to preach at St Paul's Cross. This necessity appears to have been a severe ordeal to his modest nature, the more so that the weather proved very unfavourable for his journey; but, says Walton, 'a warm bed, and rest, and drink proper for a cold, given him by Mrs Churchman [the Shunamite at whose house the preachers were lodged], and her diligent attendance added unto it, enabled him to perform the office of the day, which was in or about the year 1581.' But the scheming widow's kindness proved too much for the simple-minded scholar. He was led into a marriage with her daughter Joan, who brought him neither beauty nor portion, was 'clownish and silly' in Wood's phrase, and, what was worse, proved both a shrew and a scold. Every reader knows Walton's account of the visit of Sandys and George Cranmer to their old master at his living of Drayton-Beachamp, in Buckinghamshire, whither he had retired. They found him tending the sheep, his Horace in his hand, and not long after they reached the house Richard was called from their company to rock the cradle. Soon after this Hooker was transferred, at the recommendation of Archbishop Sandys, and through the influence of Whitgift, to the Mastership of the Temple, against a strong effort made to promote the afternoon reader Travers, a prominent Puritan leader. The union of the colleagues, as might have been expected, was not a happy one. Travers was the more popular preacher, if the less profound thinker, and Fuller tells us that 'the congregation in the Temple ebbed in the forenoon and flowed in the afternoon.' The sermons of Travers soon became attacks upon what he considered the latitudinarianism and errors of Hooker, and, indeed, as Fuller says pointedly elsewhere, 'the pulpit spake pure Canterbury in the morning, and Geneva in the afternoon,' a state of matters that Whitgift soon put an end to by silencing Travers. The fiery Puritan appealed to the Council with a series of set charges against Hooker's doctrine, and Hooker answered him with masterly conclusiveness and temperance. But having been drawn into this personal controversy against his inclination, he felt it to be his duty to set forth the larger question of the real fundamental basis of all church government, and to this end desired Whitgift to remove him to some quiet living, 'where I might behold God's blessing spring out of my mother earth, and eat my own bread without oppositions.' Accordingly, in 1591 he accepted the living of Boscombe, six miles from Salisbury, becoming also sub-dean and prebendary of Sarum; and here he finished four of the proposed eight books of the *Laws of Ecclesiastical Polity*, which were, however, not published till 1594 in a small closely-printed folio. The year after he removed to the living of Bishopsborne, three miles from Canterbury, where

he remained till his death, unconscious of his growing fame, a parish priest of unexampled humility and devotedness. His fifth book appeared in 1597, but the author did not live to complete his work, dying on the 2d November 1600 of a cold caught in a passage by water betwixt London and Gravesend. Almost his last words were upon the 'blessed obedience and order of the angels, without which peace could not be in heaven, and, oh that it might be so on earth!' He was buried in his own church, and left his widow and four daughters behind him. Sir William Cowper, great-grandfather of the first Earl Cowper, built him a monument in Borne church, and in a poetical epitaph of his own composition applies to Hooker the famous term *judicious*, which will never be dissociated from his name.

At the time of his death the last three books were believed to be nearly complete, but if so, they were soon lost, the blame of which was laid, apparently with some justice, upon Hooker's widow and her Puritan relatives, who were supposed to abhor the theology contained in them. Some months after his death the rough drafts of the completed books that remained were reluctantly given up to the archbishop, and by him entrusted to Hooker's friend, Dr Spenser, to prepare for publication. The latter reprinted the first five books in 1604, but his further labours were interrupted, and after his appointment to be president of Corpus (1607), he entrusted the papers for transcription to a young scholar named Henry Jackson, who issued some of the *Sermons* (1612-14). But Spenser died in 1614, bequeathing the papers 'as a precious legacy' to Dr King, Bishop of London. Soon after his death in 1621 they were claimed by Abbot for Lambeth Library, where they remained till Land's commitment for high-treason, when the library was handed over first to the custody of Prynne, next of Hugh Peters. Thereafter the fate of the original papers is unknown. In 1648, as Wood tells us, but more likely in 1651, the sixth and eighth books were published at London, described as 'according to the most authentique copies,' and, indeed, we have good grounds for believing that this text is substantially genuine, being to a certain extent guaranteed to us by Bishop Andrewes and Archbishop Ussher. But, unfortunately, as Keble points out, in its present form the sixth book is an entire deviation from its subject, which should have been, according to the plan of the whole treatise, a discussion of the claim of lay elders to a share in church government, whereas about nineteen-twentieths of the whole is taken up with a series of dissertations on Primitive and Roman penance, in their several parts, confession, satisfaction, absolution. Now Hooker's discussion of lay elders would be just the part of his work most displeasing to the Puritans of his time, and the presumption is perfectly reasonable that this part of the original work was destroyed. At the same time, as Keble points out, the sixth book bears every mark of being Hooker's work, though it is not in its place as a part of the *Ecclesiastical Polity*. The seventh book appeared first in 1662, in the new edition of Hooker issued by Gauden, the *soi disant* author of the *Eikon Basilike*, and not entirely a reassuring editor. The famous *Life* by Walton was written for a second edition, issued in 1666, in order to correct the inaccuracies in the life provided by Gauden. Walton's account of the saintly and simple-minded theologian is one of the finest pictures in the whole range of English biography, but it should be remembered that in this case he was not sketching from life, and Keble pointed out that the super-simplicity and excessive meekness and temperance attributed to him harmonise but indifferently with the masterly intellect, the incisive irony, and keen humour that were in Hooker.

Hooker's *Laws of Ecclesiastical Polity* is the earliest great philosophical work written in the English tongue, and is a noble monument of massive prose no less than of profound thought and masterly logic. The style is neither artificial nor involved, but as well ordered and well sustained throughout as the thinking itself, while it is capable of a grave and modulated rhythm that rises at times into the region of serene yet impassioned eloquence. As a thinker he is judicious in the highest sense of the word, and his work forms a broad and enduring foundation adequate for the church of a great nation. Its fundamental idea is that of the unity and all-embracing nature of law, considered as the manifestation and development of the divine order of the universe. The paramount law which dominates the universe is itself but the outward expression of the government of God, and is ever identical with calm and temperate reason. Reason is the criterion by which even revelation is to be distinguished as to what is eternal and immutable and what is variable according to the necessities of expediency. There is a broad distinction between natural and supernatural law, but both supplement and complete each other, both have their place in the interpretation of the ways of God to man. Authority must ever be allowed great weight in the government of the world, but it must ever be kept in harmony and conformity with reason. A necessity of polity may be held in all churches and governments without holding any one fixed form to be necessary, for these forms are not *natural* but *positive*, and therefore alterable and subject to expediency as interpreted by temperate reason. But the eternal facts of morality are necessary and self-evident postulates of the divine government of the world, and thus rest on verities that cannot be shaken. The whole furnishes a conclusive answer to the Puritan extreme and exaggeration of the central position of Protestantism, the making of Scripture the sole guide of human conduct, which rests and depends rather on the concurrence and co-operation of all the various sources of knowledge that Divine Providence has provided for man. It is not too much to say that it is mainly to Hooker's work that Anglican theology owes the tone and the direction that it has never since entirely lost.

His first book is built on a broad foundation of first principles; his second and third form polemic corollaries to the first; and in the fourth and fifth we have his detailed defence of church discipline and ritual; while the last two contain a defence of its government and its relation to the state. The fifth book is a complete apology for the Anglican Church and its usages, stamped throughout with characteristic breadth and wisdom. Hooker maintains the high religious value of ritual interpreted by the principle of symbolism, and kept in harmony with primitive usage so as to carry with it the weight of undivided authority, yet asserts the right of the living authority within the church itself both to enact and to dispense, in order to avert anarchy and disruption. In his defence of Episcopacy in the seventh book he shelters himself behind no divine right or assumption of formal scriptural authority, but maintains its superiority as a form of church government, both from its undeniable antiquity and its practical utility in actual experience. In his eighth book Hooker discusses the question of the royal supremacy and the mutual relations of church and state. To him, as to Arnold and Stanley, church and state are merely co-extensive terms, and men owe civil duties to the whole community as a state, spiritual duties to it as a church. The royal supremacy is nothing more than the assertion of national unity and independence as against mere sacerdotal pretensions, the whole body politic under its executive head, the crown, being equally con-

cerned in the framing of all laws affecting the church, itself considered but as a part of a greater whole. On this question modern conditions have entirely shifted the bases of discussion, and, whether rightly or wrongly, Hooker's dream of a church and state one and indivisible now seems to Englishmen little more than a devout imagination.

Hooker, THOMAS, one of the founders of Connecticut, was born at Markfield, Leicestershire, in 1586, studied at Cambridge, and became a Fellow of Emmanuel College, and was for four years a lecturer at Chelmsford. Ejected for nonconformity, he lived in Holland until 1633, when he went to Massachusetts, and received a charge at Cambridge. In 1636 he removed with his congregation to Connecticut, and founded the town of Hartford, where he died, 7th July 1647. Hooker was a man of great influence in New England, and published many sermons and polemical works. A selection, with a Life, was printed at Boston in 1849.

Hooker, SIR WILLIAM JACKSON, a celebrated English botanist, was born at Norwich in 1785. Of independent means from an early age, he devoted himself to natural science. His first work was a *Journal of a Tour in Iceland* in 1811, written from memory, his diaries and collections having been burned. It proved so popular that a second edition was called for in 1813. He married in 1815, and settled first at Halesworth in Suffolk, but was appointed by the crown to the chair of Botany at Glasgow University in 1820. In 1841 he was appointed director of the Royal Gardens at Kew, and his energy and enthusiasm extended it enormously. He was made K.H. in 1836. Already F.R.S. in 1810, he became later D.C.L. of Oxford, LL.D. of Glasgow, and an honorary member of most foreign scientific societies. He exercised much influence in botanical appointments and in naming naturalists to accompany exploring expeditions. His herbarium and his admirable library were given to Kew. He died August 12, 1865. His name survives in Mount Hooker in the Rocky Mountains, and in Hookeria, a natural order of mosses.

His *British Jungfermannia* (1816); his edition of Curtis's *Flora Londinensis* (1817-28); *Muscologia Britannica* (1818), in conjunction with Dr T. Taylor; and *Musci Exotici* (1818-20) were his chief early works. Later books were *Exotic Flora* (1822-27); the *British Flora*, with Dr Walker-Arnott (1830); *Icones Filicum*, with Dr Greville (1829-31); *Icones Plantarum* (1837-54); *Species Filicum* (1846-64); and *Filices Exoticae* (1857-59). Yet he found time in his busy life to edit the *Botanical Magazine* (1827-65), the *London Journal of Botany* (1842-48), and the *Journal of Botany and Kew Miscellany* (1849-57).

SIR JOSEPH DALTON HOOKER, son of the preceding, and also an eminent naturalist, was born at Halesworth in Suffolk, June 30, 1817. He was educated at the High School and university of Glasgow, and graduated as M.D. there in 1839. He next joined the antarctic expedition of the *Erebus* and *Terror*, returning after a four years' absence to superintend the publication of his magisterial *Flora Antarctica* (1844-47), *Flora Novae Zelandiae* (1853-55), and *Flora Tasmaniae* (1860). He acted for some time as substitute for Professor Graham in the chair of Botany at Edinburgh University, was appointed in 1845 botanist to the Geological Survey of Great Britain, and next year started on a botanical expedition to the Himalayas, which occupied him for three years. His *Himalayan Journals* (1854) contains the narrative of this expedition, and the *Rhododendrons of the Sikkim-Himalaya* (1849-51) illustrates the most remarkable additions which he made to the ornamental plants of our gardens on this occasion. With Dr Thomson

of the Calcutta Botanic Gardens he undertook a *Flora Indica* (vol. i. 1855), still a splendid fragment. He published later a flora of British India (1874-97). In 1871 he made an expedition to Morocco, ascended the Great Atlas, the summit of which had never before been reached by a European, and brought back a valuable collection of plants. His *Tour* appeared in 1878. In 1877 he accompanied Dr Asa Gray in a scientific tour through Colorado, Utah, and California.

Dr Hooker was appointed assistant-director at Kew Gardens in 1855, and on the death of his father in 1865 he succeeded him as director. He succeeded him also in those liberal ideas which have made Kew the real centre of the botanical world. He was president of the British Association meeting at Norwich in 1868, and in his much-debated address professed himself entirely an adherent of Darwin. From 1873 to 1878 he was president of the Royal Society, was made C.B. in 1869, K.C.S.I. in 1877, and G.C.S.I. in 1897; and was awarded the Order of Merit on his ninetieth birthday. One of his best-known works is his useful *Student's Flora of the British Islands* (1870); his most important, the *Genera Plantarum*, in conjunction with George Bentham (3 vols. 1862-83). He died 10th December 1911. See *Life and Letters* by Leonard Huxley (1918), and *Life* by Bower (1919).

Hookworm. See ANKYLOSTOMIASIS, MINING.

Hoole, JOHN, translator and dramatist, was born at Moorfields, London, in 1727, and at the age of seventeen became a clerk in the East India House, where he remained until 1783. He published translations of the *Jerusalem Delivered* (1763) and *Rinaldo* (1792) of Tasso, the dramas of Metastasio (1767), and the *Orlando Furioso* of Ariosto (1773-83). This last Southey speaks of as 'that vile version of Hoole's,' and Scott describes the translator himself as 'a noble transmutter of gold into lead.' His dramas were *Cyrus* (1768), *Timanthus* (1770), and *Cleoneice* (1775)—all of them failures, although Johnson, who was Hoole's friend and spoke well of his verses, praises the last in a complimentary letter. Hoole died 2d April 1803. See *Anecdotes of the Life of John Hoole* (1803).

Hoop Ash. See NETTLE-TREE.

Hooper, JOHN, an English bishop and martyr, was born in Somersetshire about 1495, and educated at Merton College, Oxford, whence in 1518 he passed to a Cistercian monastery at Gloucester. The reading of Zwingli made him a Reformer, and having for some time served as chaplain to Sir Thomas Arundel he twice went, in 1539-40, for safety's sake to the Continent, and after travelling in France and Germany married and settled for three years at Zurich. In 1549 he returned to England, and became a popular preacher in London. In 1550 he was appointed Bishop of Gloucester, and for his difficulty about the oath and his objections to wearing the episcopal habit was imprisoned for sometime in the Fleet. His labours as a bishop were incessant, and he wore out nature in devotion to his duty. In 1552 he received the bishopric of Worcester *in commendam*. Next year at the commencement of Mary's reign he was committed to the Fleet, and after eighteen months' imprisonment was tried for heresy and condemned to death. He was burned at the stake at Gloucester, February 9, 1555, his sufferings being much prolonged by the use of green wood. His *Early Writings* were edited by the Rev. Samuel Carr in 1843; his *Later Writings*, by the Rev. Charles Nevinson in 1852, both for the Parker Society.

Hooping-cough (or WHOOPING-COUGH; technically, *Pertussis*) is an infectious and epidemic disease, mostly attacking children under ten,

especially in spring and autumn. Its earliest symptoms, which usually appear five or six days after exposure to infection, are those of a common cold, as hoarseness, a watery discharge from the eyes and nose, oppression of the chest, a short dry cough, and more or less feverishness. This stage, which is called the *catarrhal*, lasts a week or ten days, when the fever remits, and the cough becomes more troublesome, is worse at night, and occurs in paroxysms consisting of a series of short expiratory puffs followed by a deep inspiration of air through the contracted cleft of the glottis (Larynx, q.v.), causing the characteristic 'whoop.' The attack usually terminates in the expectoration of glairy mucus or in vomiting. During the fit of coughing the face becomes red or livid, the eyes project, and the child seizes some person or object near him for support. These paroxysms occur at uncertain intervals, and between them the child returns to his play, takes his food with good appetite, and exhibits little or no sign of illness. The disease reaches its height at about the end of the fourth week, after which the paroxysms diminish in frequency, and the patient shows signs of improvement. The second stage may last from two to eight weeks, and, if no relapse occur, is succeeded by what may be termed the convalescent stage, the duration of which is very variable.

This is one of those diseases which seldom occur more than once in a lifetime; and it is comparatively rarely noticed in adults. Morbid anatomy has failed to throw any direct light upon its special seat, and though a bacillus resembling that of influenza has been described in connection with cases of whooping-cough, there is considerable doubt if this is the actual cause. The proportion of deaths to recoveries has not been satisfactorily determined, but when there is a severe epidemic the mortality due to this disease is often very great, the prospect being worse in the very young and in unhealthy children. This mortality is in reality due to the bronchitis, pneumonia (or inflammation of the lungs), and convulsions, which are frequent complications of whooping-cough, not to whooping-cough itself.

The treatment of whooping-cough consists in general measures to prevent complications, and in special treatment for shortening the disease and diminishing the violence of the spasms. The child should be kept in the house with the temperature about 60° F., while quiet and the avoidance of excitement must be enforced. The diet should be simple, nutritious, and not too starchy. If the natural vomiting be not sufficient to relieve the chest and stomach of mucus, some expectorant mixture, especially pectoric, or even an emetic dose of ipecacuanha wine, should be given. The bowels should be kept moderately open. In the *catarrhal* stage a simple expectorant is all that is needed, but when the whoop is developed belladonna in large doses and bromide of ammonium help to relieve it, and to prevent other nervous symptoms. Soothing inhalations and stimulating liniments to the chest are useful if the catarrh of the chest is severe, and during convalescence nothing is so important as a change of air, while precautions are taken against glandular enlargements by building up the system.

Hoopoe (*Upupa*), a genus of beautiful birds of wide distribution in the Old World, well marked by a large erectile crest of paired feathers. The Common Hoopoe (*U. epops*), a summer visitor in Europe and Northern Asia, wintering in India and equatorial Africa, is an ill-fated rarity in Britain, where its occurrence is recorded almost every year. There are a few other species, all closely alike. Hoopoes are about the size of thrushes, graceful,

pleasing birds, capable of long and lofty flight, but feeding for the most part on the ground on worms, grubs, and insects, which are characteristically sought for in very unsavoury places. The nest, usually in a hole in a tree or wall, is allowed to

Common Hoopoe (*Upupa epops*).

become very insanitary. The name refers to the soft note, particularly of the courting male; an excited bird utters a harsh croak. While the Arabs revere the hoopoe and attribute marvellous qualities to its head, some other peoples know it only as an autumnal tit-bit.

Hoops. See CRINOLINE.

Hoorn, a decaying town and seaport of North Holland, on a bay of the Zuider Zee, 27 miles NNE. of Amsterdam by rail. In the 17th century it had 20,000 inhabitants, and still it is full of antique carved houses; but, like the other 'dead cities of the Zuider Zee,' it has greatly fallen off in prosperity. There is still, however, a trade in butter and cheese. Here the large nets for herring-fishing were invented. Pop. 10,000.

Hoosac Mountain, part of the Berkshire Hills in western Massachusetts, a continuation of the Green Mountains of Vermont. The Hoosac tunnel, very nearly 5 miles long, was begun in 1851 for the line between Boston and Albany, was twice abandoned, and was finally opened in 1875, having cost the state of Massachusetts about \$20,000,000.

Hoosick Falls, a village of Rensselaer county, New York State, 30 miles NE. of Albany. Three miles to the north the battle of Bennington was fought on 16th August 1777. Agricultural machinery is manufactured. Pop. 5000.

Hoove, or HOVEN, is a distention of the stomachs, but particularly of the rumen or first stomach, with gas. This is a common complaint among cattle and sheep, and results from choking, from the eating of food to which the animal has been unaccustomed, from wet clover or vetches, or from any easily fermentable food. Relief generally follows walking exercise, friction on the belly, and a dose of any ordinary stimulant, which for a cow may consist of a couple of ounces of turpentine, whisky, ether, or ginger, to which should also be added, in order to clear the bowels of the offending food, a laxative, such as a pint of oil or a pound of salts. A fourth or fifth of these quantities will suffice for sheep. The introduction of the probang, with the small end downwards, allows the escape of gas when there is little food in the stomach. If simple remedies fail, the breathing becomes distressed and the animal stupid; the gas may with safety be allowed to escape by an external opening made at a point intermediate

between the last rib, the lumbar vertebræ, and the prominence of the haunch, with a canula and trochar. For several days after an attack of hoove the digestive organs are apt to be easily deranged, and the animal must have soft, digestible food in moderate quantities, and an occasional dose of simple laxative medicine.

The horse's bowels when distended with gases give rise to a more serious condition than hoove in ruminants. They are often punctured with the best results, a trochar of smaller diameter being used than is generally used in the ox, and the point usually selected for inserting the instrument is the right upper flank. As the horse is much more liable to peritonitis than the ox, every care should be taken to have the instrument clean, the seat of puncture should be clipped and aseptised, and the wound maintained aseptic if possible.

Hoover, HERBERT CLARK, born at West Branch, Iowa, in 1874, graduated from Stanford University in 1895. He travelled to China, Australia, and other parts of the world in pursuance of mining developments, and at the outbreak of the Great War he was in London. He was appointed chairman of the Belgium Relief Committee, and he carried the work through with great efficiency. In 1917 he became Federal Food Administrator to the U.S.A., and at the armistice he turned his attention to the destitute population of central Europe, founding storehouses of food for their relief at various points. He became secretary of Commerce (1921), but still carried on his European work. In particular, he supervised the relief work in Russia. He is the author of *Principles of Mining* (1909), and, in collaboration with his wife, published a translation of Agricola's *De Re metallica* (1912).

Hop (*Humulus lupulus*), a perennial diœcious plant of the natural order Cannabinaceæ, the only species of its genus. It has long, rough, twining stems, and stalked 3- to 5-lobed rough leaves, and is a plant of luxuriant growth and abundant foliage. The male flowers grow in loose branching axillary panicles, and consist of five stamens surrounded by a 5-lobed perianth. The female flowers are in *strobiles*, or cones, with large persistent, concave, entire scales, which enlarge as the fruit ripens. The part of the hop so much used in brewing, and sold under the name of hops, is the ripened cone of the female plant. Female plants alone, therefore, are cultivated to any considerable extent, it being enough if a few male plants are scattered over a field.

The hop is first mentioned by Pliny as one of the garden plants of the Romans, who ate the young shoots as we eat asparagus; as, indeed, many country people in England do at the present day. It is a native of Europe and of some parts of Asia, a doubtful native of Britain and of North America. It is extensively cultivated in the south of England, especially Kent; also in Germany, France, Flanders, southern Russia, Australia, and New Zealand.

The cultivation of the hop was introduced into England from Flanders in the time of Henry VIII., but did not become sufficient for the supply of the kingdom till the end of the 17th century. For some time after hops began to be used in brewing a strong prejudice existed against the innovation; and parliament was petitioned against hops, as 'a wicked weed, that would spoil the taste of the drink, and endanger the people.'

The hop requires deep rich soil on a dry bottom, and succeeds best in a sheltered situation with a south or south-west aspect; yet there should be a free circulation of air. The ground is generally well pulverised and manured to a considerable

depth by the plough or spade before planting. The plants are usually set in stools of from three to five, a few inches apart, in rows six feet asunder, with the same space between the stools. They are obtained from cuttings or suckers taken from the

Hop (*Humulus lupulus*).

healthiest old stools, and are usually planted out somewhat closely in nursing lines for twelve months before being planted permanently. They make very little growth the first year, and not until the third year do they come to full bearing, when from four to six poles from 14 to 18 feet long are required for each stool. The most favoured timber for hop-poles is Spanish chestnut, which is extensively grown in hop-districts as coppice-wood for this purpose. The poles are set to the plants in spring before growth commences, and removed when the stalks are cut away in autumn. The plants are then dressed with manure, and the soil between the stools is stirred lightly with the fork. In Germany the poles are fewer and much taller than in England—from 23 to 27 feet high.

The cones are known to be fit to gather when they acquire a brown amber colour and firm consistence. The stalks are then cut at the base, and removed along with the poles and laid horizontally on frames of wood, to each of which is attached by tenter-hooks a large bag-like cloth into which the hops fall as they are picked by women and children, who are employed in great numbers at this work. When picked the hops are immediately conveyed to the kiln to be dried, as otherwise they are liable to heat and become spoiled in a few hours, especially when they are picked in a moist state. The operation of drying hops is similar to that of drying malt, and the kilns are of the same construction. Great care is required in drying to prevent overheating, by which the essential oil is liable to be volatilised. The hops are spread on hair-cloth from 8 to 12 inches deep, and when the ends of the stalks have become shrivelled and dry they are taken off the kiln, and laid on a wooden floor till they become quite cool, when they are put in bags or pockets.

The produce of no British crop is more precarious than that of the hop. In a good season it may be as much as 20 cwt. per acre, in a bad season none or at most perhaps 2 or 3 cwt. The plant has many enemies, both insect and fungoid parasites, which prey upon it, and destroy the crop season after season. It is calculated that on an average the hop-crop fails every five or seven years. This,

in conjunction with the heavy expense of the first formation of a plantation, precludes any but those having considerable capital from taking up its cultivation. But the produce of plentiful years, if properly preserved, may be kept to meet the demand when scarcity may raise the price; consequently to those who can wait few crops are equally profitable.

The best varieties of the hop are the Hill Golding, the East Kent Golding, Golden Hops, Jones's Hops, Grape Hops, and Farnham White Bine. The Goldings are the best and richest. The Jones's are valued for their habit of short growth, requiring shorter poles. The Colgates and Grape Hops are hardy and prolific on poorer soil than any of the others.

The fibre of the stems is employed to some extent in Sweden in the manufacture of a coarse kind of cloth, white and durable; but the fibres are so difficult of separation that the stems require to be steeped in water for a whole winter.

The fruit of the hop is a little nut, not larger than a grain of mustard-seed, and between its outer shell and the kernel there is a small quantity of a peculiar granular substance which also exists as a sort of efflorescence on the surface of the scales themselves; much of the value of the hop depends upon the abundance of this substance. It is not a mere powder, but each grain is a little organised cellular body, of an oval or round form, and, when seen under the microscope, having a reticulated surface. The powder contains some 10 per cent. of *lupuline*, the bitter principle to which hops seem to owe their tonic properties. The oil of hops is sedative, anodyne, and narcotic; the pleasantly aromatic odour has somewhat of the same qualities, hence the value of pillows stuffed with hops in cases of mania, sleeplessness, &c. The bitter principle is not narcotic, but tonic. The oil and bitter principle combine to make hops more useful than camomile, gentian, or any other bitter, in the manufacture of beer; hence the medicinal value of *extra hopped* or *bitter* beer. The tannic acid contained in the strobiles or cones of flowers also adds to the value of hops, particularly as causing the precipitation of vegetable mucilage, and consequently the clearing of beer. Hops were dropped from the British Pharmacopœia in 1914. *Hop bitters* are used as a tonic. See also **BEER**.

Until the year 1862 hops paid an excise duty, and formed an important part of the revenue, although a very variable crop, owing to the serious check it is liable to from insects, fungi, diseases, and the weather.

HOP-PESTS.—Hops are attacked by a destructive mildew, which may be treated with flowers of sulphur, and by a number of animal pests. Among

Hop Aphis (*Phorodon humuli*)

a, b, winged form of female, natural size and magnified; c, d, the wingless form of female, natural size and magnified (from Miss Ormerod).

these may be noted the Hop-flea (*Plectrocellis concinna*), a minute beetle like the Turnip Flea-beetle, the Ghost Moth (q.v.), the Spinning Mite (*Tetranychus malvae*), usually called Red Spider, and the formidable Hop-fly (*Phorodon humuli*), a kind of Aphis (see **APHIDES**) or plant-louse, important on

account of the injury it inflicts in some seasons on the hop-plantations. The general colour is pale green, as the common name 'green fly' indicates. The males, which are winged, appear in autumn, and pair with wingless females. These lay eggs, which develop next spring into swarms of winged females. These produce parthenogenetically and viviparously great numbers of larvæ, 'lice,' or 'nits,' which usually remain wingless, but rapidly mature, and soon become the virgin and viviparous parents of fresh swarms. Males and sexual reproduction reappear in autumn. Both larvæ and adults ruin the plants. No efficient method of preventing the ravages of this pest has yet been discovered; but the beneficial service to man of lady-birds and other natural foes of this fly has been long and widely recognised.

Hope, ANTHONY. See **HAWKINS (SIR ANTHONY HOPE)**.

Hope, THOMAS, author and connoisseur, was born in London in 1774. While still a youth he travelled over a large portion of Europe, Asia, and Africa, and collected many drawings, chiefly of buildings and sculptures. In England he first attracted attention by the splendid decorations which he bestowed on the interior of his mansion in Duchess Street, Portland Place, London, a description of which appeared in his book on *Household Furniture* (1805). In 1809 he published *Costume of the Ancients and Architecture of Theatres*, in 1812 *Modern Costumes*, and in 1819 (anonymously) *Anastasius, or Memoirs of a Modern Greek at the close of the 18th Century*. This last work is his masterpiece, and by many was ascribed to Lord Byron, who was greatly flattered by the rumour. It is certainly a brilliant and erudite performance; still it wants the dramatic *vis* of a genuine work of genius. Hope died 3d February 1831, leaving behind him a very heterodox but rather eloquent essay *On the Origin and Prospects of Man* (1831), and an *Historical Essay on Architecture* (1835).

His third son, **ALEXANDER JAMES BERESFORD-HOPE**, born in 1820, was educated at Harrow and Trinity College, Cambridge, where he graduated B.A. in 1841. He was twice Conservative member for Maidstone (1841–52, 1857–59), and for Cambridge University from 1863 till his death on 20th October 1887. In 1880 he was sworn a privy-councillor, and in 1881 Dublin University created him an honorary LL.D. A zealous High-Churchman, he was the principal founder of St Augustine's missionary college at Canterbury (q.v.), and published several works on church topics, as well as two novels, *Strictly Tied Up* (1880) and *The Brandreths* (1882). He was also a proprietor of the *Saturday Review*.

Hope-Scott, JAMES, third son of the Hon. Sir Alexander Hope, and grandson of the second Earl of Hopetoun, was born at Marlow in 1812, and from Eton proceeded to Christ Church, Oxford. He contented himself with a pass degree (1832), but got a fellowship at Merton; and, called to the bar in 1838, soon made a great parliamentary practice. In 1847 he married Miss Lockhart, on whose succession six years later to Abbotsford he assumed the additional surname of Scott; and in 1851 both he and his wife were admitted into the Roman communion. He died in London, 29th April 1873. His *Life* by Robert Ormsby (2 vols. 1884) is specially interesting for the glimpses it gives of men like Newman and Gladstone.

Hôpital, MICHEL DE L'. See **L'HÔPITAL**.

Hopkins, ESEK, an American naval officer who, born at Scituate, Rhode Island, in 1718, became first admiral of the American navy. He was a noted seaman in the years before the

war, and on its outbreak he hoisted his flag as commander of the eight converted merchantmen which then constituted the fleet. He took the forts at New Providence in 1776, with much war material, but later had an indecisive fight with the *Glasgow*. He was censured by congress, and in 1777 the mutual distrust culminated in his dismissal from the service. He retired to Rhode Island, where he was prominent in politics, and where he died in 1802.

Hopkins, JOHN. See STERNHOLD.

Hopkins, JOHNS, was born, 19th May 1795, in Anne Arundel county, Maryland, where his parents, Quakers, gave him a fair education and the training of a farmer. At the age of seventeen, however, he went to Baltimore, there became a grocer, and in 1822 founded the house of Hopkins and Brothers. From the grocer's business he retired in 1847 with a large fortune, which he employed in banking and railway operations. In 1873 he gave property worth \$4,000,000 to found a free hospital; he presented Baltimore with a public park, and he also gave over \$3,500,000 to found the Johns Hopkins University in Baltimore (q.v.). He died 24th December 1873.

Hopkins, MATTHEW. See WITCHCRAFT.

Hopkins, SAMUEL, D.D., born at Waterbury, 17th September 1721, graduated at Yale College in 1741, studied theology with Jonathan Edwards, and from 1743 to 1769 was settled as pastor of Housatonic (now Great Barington), Massachusetts. He then removed to Newport, where he died, 20th December 1803. His writings include a life of President Edwards, sermons, addresses, a treatise on the millennium, and his *System of Doctrines* (1793); these were republished with a memoir by Dr E. A. Park at Boston (3 vols. 1854); and an earlier edition (1805) contains some autobiographical notes. Hopkins, who is said to be the hero of Miss Beecher Stowe's *Minister's Wooing*, was remarkable for his simplicity, devoutness, and unselfishness. Those who adopt the Hopkinsian theology are not a distinct sect, but are pretty numerous in America, in some of the Christian bodies of which the tenets are generally Calvinistic. They hold most of the Calvinistic doctrines, and even in their most extreme form, but they entirely reject the doctrine of imputation, both the imputation of Adam's sin and of Christ's righteousness. The divine efficiency extends to all acts whatsoever, and sin itself under the guidance of divine providence is merely a necessary means of the greatest good. The fundamental doctrine of the Hopkinsian system, however, is that all virtue and true holiness consist in *disinterested benevolence* (involving unconditional submission), and that all sin is *selfishness*—the self-love which leads a man to give his first regard even to his own eternal interests being condemned as sinful.

Hoppner, JOHN, R.A. (c. 1758–1810), was born at Whitechapel, but was brought into touch with court circles, and was reputed a son of George III. when Prince of Wales. At first a chorister in the Chapel Royal, he entered the schools of the Royal Academy in 1775; and under the patronage of the Prince of Wales he became a fashionable portrait-painter, and the rival of Lawrence. Elected A.R.A. in 1792, and R.A. in 1795, he has left many fine and thoughtful portraits, which include 'Lord Rodney,' 'Lord Nelson,' and the 'Countess of Oxford,' which may be considered his masterpiece. Although perhaps too greatly influenced by Reynolds, his reputation has risen, and his pictures have commanded high prices. Hoppner, who wielded a caustic pen, wrote *Oriental Tales* in verse, and was a contributor to the *Quarterly Review*. See books by McKay and Roberts (1909, 1914).

Horace. QUINTUS HORATIUS FLACCUS, Latin poet and satirist, was born near Venusia in southern Italy, on the 8th December 65 B.C. His father was a manumitted slave, who as collector of taxes or auctioneer had saved money to buy a small estate. Apparently an only child, Horace received an education almost beyond the means of his father, who took him to Rome, gave him upper-class dress and attendance, and sent him to the best masters. At seventeen or eighteen he proceeded to Athens, then the chief school of philosophy, and one of the three great schools of oratory, to complete his education; and he was still there when the murder of Julius Caesar, 15th March 44 B.C., rekindled the flames of civil war. In the autumn of this year Brutus, then propætor of Macedonia, visited Athens while levying troops. Horace joined his side; and such was the scarcity of Roman officers that, though barely twenty-one and totally without military experience, he was at once given a high commission. He was present at the battle of Philippi, and joined in the general flight that followed the republican defeat; he found his way back to Italy, and apparently was not thought important enough for proscription by the triumvirate. His property, however, had been confiscated, and he found employment in the lower grade of the civil service to gain a livelihood. It was at this period that poverty, he says, drove him to make verses. His earliest were chiefly social satires and personal lampoons; but it was probably from some of his first lyrical pieces, in which he showed a new mastery of the Roman language, that he became known to Varius and Virgil, who in or about 38 B.C. introduced him to Mæcenæ, the confidential minister of Octavianus, and a munificent patron of art and letters. The friendship thus formed was uninterrupted till the death of Mæcenæ, to whose liberality Horace owed release from business and the gift of the celebrated farm among the Sabine hills. From this time forward his life was without marked incident. His springs and summers were generally spent at Rome, where he enjoyed the intimacy of nearly all the most prominent men of the time, his autumns at the Sabine farm or a small villa which he possessed at Tibur; he sometimes passed the winter in the milder seaside air of Baia. Mæcenæ introduced him to Augustus, who, according to Suetonius, offered him a place in his own household, which the poet prudently declined. But as the unrivalled lyric poet of the time Horace gradually acquired the position of poet-laureate; and his ode written to command for the celebration of the Secular Games in 17 B.C., with the official odes which followed it on the victories of Tiberius and Drusus, and on the glories of the Augustan age, mark the highest level which this kind of poetry has reached. On the 27th November 8 B.C. he died in his fifty-seventh year. Virgil had died eleven years before; Tibullus and Propertius soon after Virgil. Ovid, still a young man, was the only considerable poet whom he left behind; and with his death the great Augustan age of Latin poetry ends.

The following is the list of Horace's works, arranged according to the dates which have been most plausibly fixed by scholars. Some of the questions of Horatian chronology, however, are still at issue, and to most of the dates now to be given the word 'about' should be prefixed.

The first book of *Satires*, ten in number, his earliest publication, appeared 35 B.C. A second volume of eight satires, showing more maturity and finish than the first, was published 30 B.C.; and about the same time the small collection of lyrics in iambic and composite metres imitated from the Greek of Archilochus, which is known as

the *Epodes*. In 19 B.C., at the age of forty-six, he produced his greatest work, three books of *Odes*, a small volume which represents the long labour of years, and which placed him at once in the front rank of poets. About the same time, whether before or after remains uncertain, is to be placed his incomparable volume of *Epistles*, which in grace, ease, good sense, and wit mark as high a level as the *Odes* do in terseness, melody, and exquisite finish. These two works are Horace's great achievement. The remainder of his writings demand but brief notice. They are the *Carmen Seculare* already noticed; a fourth book of *Odes*, with all the perfection in style of the others, but showing a slight decline in freshness; and three more epistles, one, that addressed to Florus, the most charming in its lively and graceful ease of all Horace's familiar writings; the other two somewhat fragmentary essays in literary criticism. One of them, generally known as the *Ars Poetica*, was perhaps left unfinished at his death.

In his youth Horace had been an aristocrat, but his choice of sides was probably more the result of accident and association than of conviction, and he afterwards acquiesced without great difficulty in the imperial government. His acquiescence was not at first untempered with regret; and in the *Odes* modern critics have found touches of veiled sarcasm against the new monarchy, and even a certain sympathy with the abortive conspiracy of Murena in 22 B.C. But as the empire grew stronger and the advantages which it brought became more evident—the repair of the destruction caused by the civil wars, the organisation of government, the development of agriculture and commerce, the establishment at home and abroad of the peace of Rome—his tone passes into real enthusiasm for the new order.

Horace professed himself a follower of the doctrines of Epicurus, which he took as a reasonable mean between the harshness of Stoicism and the low morality of the Cyrenaics. In his *Odes*, especially those written on public occasions, he uses, as all public men did, the language of the national religion. But both in religion and in philosophy he remains before all things a man of the world; his satire is more of manners and follies than of vice or impiety; and his excellent sense keeps him always to that 'golden mean' in which he sums up the lesson of Epicurus. As a critic he shows the same general good sense, but his criticisms do not profess to be original or to go much beneath the surface. In Greek literature he follows Alexandrian taste; in Latin he represents the tendency of his age to undervalue the earlier efforts of the native genius, and lay great stress on the technical finish of his own day.

From his own lifetime till now Horace has had a popularity unexampled in literature. A hundred generations who have learned him as schoolboys have remembered and returned to him in mature age as to a personal friend. He is one of those rare examples, like Julius Cæsar in politics, of genius which ripens late, and leaves the more enduring monument. Up to the age of thirty-five his work is still crude and tentative; afterwards it is characterised by a jewel-finish, an exquisite sense of language which weighs every word accurately and makes every word inevitable and perfect. He was not a profound thinker; his philosophy is that rather of the market-place than of the schools; he does not move among high ideals or subtle emotions. The romantic note which makes Virgil so magical and prophetic a figure at that turning-point of the world's history has no place in Horace; to gain a universal audience he offers nothing more and nothing less than what is universal to mankind. Of the common range of thought and feeling

he is perfect and absolute master; and in the graver passages of the *Epistles*, as in the sad and noble cadence of his most famous *Odes*, the melancholy temper which underlay his quick and bright humour touches the deepest springs of human nature. Of his style the most perfect criticism was given by a Roman critic of the next generation in a single phrase, *Horatii curiosa felicitas*; it is the product of infinite pains guided by almost faultless tact and skill. Of no poet can it be more truly said, in the phrase of the Greek dramatist Agathon, that 'skill has an affection for luck, and luck for skill.' His poetry supplies more phrases which have become proverbial than the rest of Latin literature put together. To suggest a parallel in English literature we must unite in thought the excellences of Pope and Gray with the easy wit and cultured grace of Addison.

Horace's historical position in Latin literature is this: on the one hand he carried on and perfected the native Roman growth, satire, from the ruder essays of Lucilius, so as to make Roman life from day to day, in city and country, live anew under his pen; on the other he naturalised the metres and manner of the great Greek lyric poets from Alcæus and Sappho downwards. Before Horace Latin lyric poetry is represented almost wholly by the brilliant but technically immature poems of Catullus; after him it ceases to exist. For what he made it he claims, in a studied modesty of phrase but with a just sense of his own merits, an immortality to rival that of Rome.

EDITIONS: Horace's works are believed to have been printed for the first time in 1470 at Milan. The most important commentaries (with Latin notes) are those of Denis Lambin (1561), Bentley (1711), and Orelli and Baier (1850-52). For ordinary students, with English notes, the most useful editions are by Maclean (1833), Yonge (1867), Wickham (1874-90), Wilkins (*Epistles*, 1885), Palmer (*Satires*, 1883). TRANSLATIONS: Conington, Lonsdale and Lee, Sir Theodore Martin (*Odes and Satires*), Bennett (with text, 1914). See Dean Milman, *The Life of Horace*; W. Y. Sellar, *Horace and the Elegiac Poets*; Medley's *Interpretations of Horace* (1910); J. F. d'Alton, *Horace and his Age* (1917); H. D. Naylor, *Horace: Odes and Epodes* (1922); Chapman, *Horace and his Poetry* (1922); and Prof. A. Y. Campbell, *Horace, A New Interpretation* (1924).

Horatii, the three brothers selected by Tullus Hostilius, king of Rome, to fight against the three brothers Curiatii, the champions of Alba Longa, when it was agreed to decide the quarrel between the two cities by the issue of single combat by three warriors chosen from either side. The legend goes that two of the Horatii were speedily slain; the remaining brother, yet unscathed, by a simulated flight, succeeded in engaging each of his wounded opponents singly, and in overcoming them all. As he entered the gate of Rome in triumph, bearing the trophies of the slain, he was met by his sister, whose beloved was one of the dead champions of Alba. She cursed his slayer, her victorious brother, and was by him thereupon stabbed to the heart. Horatius, condemned by the *duumviri* to be scourged to death, was afterwards saved by the people, and lived to destroy Alba Longa and carry its inhabitants to Rome. This story, although containing a very large admixture of mythical elements, points to the close relationship that existed between Rome and Alba Longa, as well as to the fact of an internecine struggle having taken place before the latter was incorporated in the political organisation of the former.

It was a descendant of the survivor of the three Horatii, named Horatius Cocles, who in 507 B.C., along with Titus Herminius and Spurius Lartius, formed the 'dauntless three,' who 'kept the bridge so well in the brave days of old,' against the army of Lars Porsena, king of Latium,

whilst their compatriots broke down the Sublician bridge behind them. Horatius escaped by swimming the 'yellow Tiber,' was received with jubilant shouts by his fellow-citizens, and overwhelmed with honours and rewards.

Horbury, an urban district of the West Riding of Yorkshire, 4 miles SW. of Wakefield, manufactures, woollens, worsteds, &c.; pop. 7800.

Hörde, a town of Westphalia, 2½ miles SE. of Dortmund, has large ironworks and coal-mines, with iron, steel, and zinc manufactories; pop. 30,000.

Hordein, a term that has been applied to a substance that can be extracted from barley (Lat. *hordeum*), which is merely a mixture of starch, cellulose, and a nitrogenous substance.

Horeb. See SINAI.

Horehound (*Marrubium*), a genus of plants of the natural order Labiatae, having a tubular 10-ribbed calyx, with 5 or 10 spiny equal teeth, 4 stamens included in the corolla, the upper lip of the corolla erect, the lower lip 3-cleft. The species are mostly perennial, herbaceous plants, natives of the south of Europe and the East. One species, the Common or White Horehound (*M. vulgare*), is a rather rare native of Britain, and is found generally throughout Europe, except in the more northern regions, growing in waste places, waysides, &c. It is frequently cultivated in gardens among collections of herbs. It is

Common Horehound
(*Marrubium vulgare*).

about 1 to 1½ feet high, bushy, with roundish, ovate, crenate, wrinkled leaves, and almost globose whorls of white flowers. The whole plant has a whitish appearance, from the down with which its leaves are covered. It has an aromatic but not very agreeable smell. It is tonic, stimulant, and laxative, and is much used in coughs, being a popular remedy, and a very safe and efficacious one. It was formerly also employed in affections of the womb and of the liver. It is administered in the form of an infusion, or made into a syrup with sugar, and sometimes the syrup is candied. Black Horehound is the popular name of *Ballota nigra*, another native of Britain, and belonging to the same natural order. For Water Horehound, see GYPSY-WORT.

Horizon, the circular line formed by the apparent meeting of the earth and sky; this, in astronomy, is *sensible horizon*. The *rational horizon* is the circle formed by a plane passing through the centre of the earth, parallel to the sensible horizon, and produced to meet the heavens. The *artificial horizon* is a small trough containing quicksilver, the surface of which affords a reflection of the celestial bodies. It may be used for calculating the altitude of the stars when the sea-horizon is obscured by fog or otherwise not available to the sailor determining his position. The *dip of the horizon* is the angle through which the sea-horizon appears depressed in consequence of the elevation of the spectator. The true dip of the horizon, however, is not exactly the same as its apparent depression. The apparent sea-horizon is raised

above its true place by *refraction* through an angle which varies according to the state of the atmosphere and the relative temperatures of the air and water, the variation ranging from one-third to one-twenty-third of the amount of the true dip.

Hormayr, JOSEPH FREIHERR VON (1782-1848), born at Innsbruck, became keeper of the Austrian archives, and in 1816 imperial historiographer. But having been imprisoned by Metternich for suspected complicity in a Tyrolese revolt, he in 1828 entered the Bavarian service, kept the Bavarian archives, and wrote on Tyrolese, Austrian, and general history.

Hormones (Gr. *hormaō*, 'excite'), a term introduced by Starling for such principles as secretin, which he and Bayliss found to be an active agent in exciting the secretion of the pancreatic juice. The name was extended to the active principles of many other secretions—some of which, far from exciting, relax, check, or inhibit. For the latter group Schäfer in 1913 proposed the term *chalones* (Gr. *chalaō*, 'relax'), and, for both hormones and chalones, recommended the name *autacoids* (Gr. *autos* and *akos*, 'remedy')—principles produced in or extracted from the internally secreting organs, and having a drug-like effect on the organs and tissues. See GLANDS.

Horn, a general term applied (1) to hard outgrowths on the head of some mammals, such as cattle, sheep, antelopes, deer, giraffe, and rhinoceros, and of some extinct reptiles—e.g. Ceratopsidae (and also, by vague analogy, to superficially similar outgrowths on various animals, such as Horned Toad (q.v.), horned viper (see CERASTES), and some beetles); and (2) to the substance called keratin, which forms many more or less hard structures, like the horny sheath of a cow's horn, nails, claws, hair, feathers, tortoise-shell, and the mermaid's purse of the skate.

(1) There are several kinds of horns in mammals: (a) The median horn of the rhinoceros consists of a compact agglutination of horny strands, added to at the base as the animal grows. The component strands are due to a proliferation of the cells of the epidermis, but into the hollow base of each strand there extends a vascular papilla of the dermis,

Front View of the Skull of the Ox, with the right
Horny Sheath detached from the Core.

which supplies the nutritive material for growth. The rhinoceros-horn is above the nasal bone, and the integument at the base of the horn coalesces with the periosteum of the bone. There may be a second median horn behind the first, and associated with the frontal bone. An integumentary horn grows out between the paired horns in a Senegambian ox (*Bos triceros*), and similar structures on a small scale occasionally occur as abnormalities on the human skin. (b) The Antlers (q.v.) of male deer (and of both sexes in the reindeer) consist of (1) a short, bony base, upgrowing from the frontal bone, and not shed; (2) a main portion, ossifying independently in the dermis, and annually shed; and (3) an integumentary sheath of vascular skin,

the 'velvet,' which dies and gets rubbed off after the antler's growth is completed for the year. (c) In the Giraffe (q.v.) and Okapi (q.v.) the paired horns have a short frontal base, a permanent dermal core or main portion, and a permanent covering of hairy skin. (d) The horns of cattle, sheep, goats, and antelopes (Cavicornia), typically present in both sexes, consist of a small frontal base, a large permanent bony core, and a permanent horny sheath, which may be far longer than the bony part. To the outside of the frontal upgrowth in a young lamb there lies a small dermal bone or *os cornu*, the equivalent of the bony part of a stag's antler; but it fuses with the frontal portion, and all distinction is then lost. Air sinuses from the frontal bone may extend into the base and the core, but not in antelopes. The horny sheath is due to the epidermis, which, along with a richly vascular and nutritive dermis, extends over the bony part of the horn. (e) In the Prong-horn (q.v.) (*Antilocapra*) of the Rockies, the horny sheath includes a cornification of hairs as well as of epidermis; it shows a short branch at the base; it is pushed off annually after the breeding season by the growth of a fresh sheath below it. In the basal growth of the horny sheath in cattle hairs may be included in the cornification, and the first horn-cap in calves is shed, so that the prong-horn is linked to the typical case. In the Indian Chikara (*Antelope* or *Tetracerus quadricornis*) there are two pairs of horns on the frontal. In the gigantic extinct antelopes, *Bramatherium* and *Sivatherium*, there were also two pairs of horns. The giraffe and okapi have a pair of small occipital horns as well as frontal horns, and in the front of the latter in the giraffe there is a low median protuberance.

(2) True horny tissue is a modified form of epidermic tissue. The term includes not only true horn, as noted above, but also hoofs, nails, claws, hair, wool, beaks of animals generally, the carapace of tortoises, the scales of the pangolin, the spines of the hedgehog and the quills of the porcupine, the feathers of birds, the 'castors' of horses and other animals, and other epidermic thickenings and growths, whether occurring normally as the callosities over the breastbone of camels and the hips of some monkeys or pathologically as the 'corns' and 'horns' of the human subject. This tissue largely consists of an albuminoid substance termed 'keratin,' which is composed of carbon (from 50.3 to 52.5 per cent.), hydrogen (from 6.4 to 7 per cent.), oxygen (from 20.7 to 25 per cent.), nitrogen (from 16.2 to 17.7 per cent.), and sulphur (from .7 to 5 per cent.). Keratin may be obtained from the structures above enumerated by the successive action of boiling water, alcohol, ether, and dilute acids, and is probably a compound body that has not yet been resolved into its components. Viewed under the microscope, horny tissue is seen to consist of numerous parallel bundles of fine threads. These threads, under the action of a concentrated solution of caustic potash or soda, unfold into small plates which gradually expand into regular nucleated epidermic cells shown in the figure.

Cellular Structure of Horn.

Cattle are frequently dishorned to prevent them from constantly goring and injuring each other when confined in open courts; the whole or part only of the horn and horn core may be removed, but the usual method is total dishorning by sawing off the horns close to the head, at their junction with the skull. If the operation is skilfully performed, and if proper precautions be taken to prevent in-

flammation following, the operation is affirmed by many to be by no means a very painful one.

HORN MANUFACTURES.—The horns of the ox, buffalo, sheep, goat, and antelope are hollow, tough, and capable of being split into flexible slices. Rhinoceros horn, though solid through nearly its whole length, resembles that of the ox in its nature. From the most remote ages the horns of animals have been employed by man for various purposes. Numerous examples of poniards, handles, pick-axes, dart-heads, harpoons, 'batons of authority' (perhaps really shaft-straighteners), and other implements of unknown use made of reindeer and red-deer horns have been found among prehistoric remains of the Palæolithic and Neolithic periods. Towards the end of the Palæolithic age red-deer horn began to take the place of reindeer horn. The latter is compact all through, the former only on the outside. The later harpoons are therefore flat instead of round in section. Among the most remarkable productions of Palæolithic man are pieces of reindeer horn with carvings or etchings of animals upon them.

Horns of the ox, as well as those of the sheep and goat, can be split up into sheets or plates after they have been soaked and boiled. When made very thin such plates were at one time used for window-panes, for the construction of lanterns, and for covering Hornbooks (q.v.). Two pieces of horn can also be welded together at the edges by steeping them in hot water and applying pressure. Another valuable property of horn is that when heated it can be pressed into a die or mould. In this way it is formed into ornamental handles for knives, forks, umbrellas, and walking canes; also into drawer-knobs, spoons, boxes, buttons, and many other useful articles. The manufacture of combs from horn is already described under COMB. It may be stated here that the hoofs of oxen are likewise manufactured on a large scale into combs, and to some extent into other articles such as buttons.

In their natural form, but cleaned and polished, horns are used as drinking-cups and snuff-boxes, and in past times they were very largely employed for holding gunpowder. They also served as wind-instruments. Many of the Scottish powder-horns in use during the 16th and 17th centuries are beautifully and elaborately carved. A considerable number of these are illustrated in Drummond's *Ancient Scottish Weapons* (1881). In India buffalo and other horns are used for ornamental work of various kinds. Rhinoceros horn again is a favourite material with Chinese carvers, who form the base of it into cups, and sometimes make a very effective ornament of the entire horn, which admits of being very boldly carved. The deer horn so much worked up at Sheffield into handles for carving and pocket knives is chiefly that of the Axis deer (*Cervus axis*) of India. Deer horns are employed in France and Germany to decorate furniture. In Great Britain the antlers or horns of the stag, the roe, and the fallow deer—generally with the skull attached—are favourite ornaments for the decoration of entrance-halls.

To show the size to which some horns attain, a pair on a Cape ox measures 9 or 10 feet from tip to tip. The horns of a large-sized Indian buffalo, though curved, are about as long. They are 8 or 9 inches broad at the base, and a single horn may weigh 11 or 12 lb. See Rowland Ward's *Horn Measurements of the Great Game of the World* (1892).

HORN, CAPE, commonly spoken of as the southernmost point of America, is a steep, black, bare mountain-headland of one of the small islands of the Fuegian Archipelago, 55° 59' S. lat., 67° 14' W. long. It was named Hoorn, anglicised Horn, when rounded in 1616 by the Dutch navigators,

Lemaire and Schouten. It was sighted by Drake in 1578. The passage commences at 50° S. in the Atlantic to end at 50° S. in the Pacific, and is one of the worst passages in the world, owing to the fact that the prevailing wind prevents sailing-ships making 'westing.' Steamers can avoid the dangerous doubling of the 'Horn' by the Strait of Magellan.

Horn, COUNT (1518-68). See EGMONT, and HOLLAND (*History*).

Horn, FRENCH (Fr. *cor*, *cor de chasse*; Ital. *corno*, *corno de caccia*; Ger. *horn*, *waldhorn*), one of the most important, as it is the softest toned, of brass instruments used in orchestral music. Its soft and peculiar tone is due to the length of the tube, the shape of the bell, and the funnel-like bore of the mouthpiece. This latter important

Fig. 1.

point will be understood from fig. 1, which shows a section of the horn mouthpiece (a) contrasted with that of the trumpet (b), the most brazen of brass instruments. The original French horn was used in hunting, and consisted of a long tube with two or three turns made large enough to go over the shoulders of the hunter. It was used from a very early period, but it was Louis XV. who composed

the complete set of sounds and fanfares still used in the French hunting-field.

It was introduced into the orchestra in the early part of the 18th century, and it gradually acquired the important position it now holds from the smooth softness of its tones as a foundation for harmony in chords, and its fine contrast with other instruments.

For orchestral purposes the instrument was improved by the addition of crooks of varying lengths, so as to pitch it in different keys; and thus horn music is always written in C with the key added to show the crook to be used. These crooks are usually eight in number, and extend from A₄ in alto to C basso; the lowest crook making the total length of the instrument a little over 16 feet. There are also tuning crooks, raising or lowering either of the others a semitone, and also a tuning slide for the more accurate tuning with the other instruments. The open notes of the horn are the harmonics of its fundamental note (see HARMONICS), and as this, from the length of the tube, is very low, the harmonics in the middle scale are at very short intervals with many consecutive notes. It may be given approximately thus :

The notes actually sounded, of course, depend on the crooks used. The method of forming the intermediate notes by hand-stopping was discovered by a player named Hampl at Dresden about 1770. The open hand, with the fingers close together, is introduced into the bell, lowering the pitch a semitone. These stopped notes, however, have a muffled sound, and in modern times the horn is almost always made with two or three valves to bridge over the intervals. Fig. 2 shows the horn with two valves as commonly used. On account of the frequent changes of pitch, and the number and

tenderness of its open notes, it is a difficult instrument to play. The horn is very seldom used

Fig. 2.

singly; either two or four being the usual number in the orchestra.

Handel, Mozart, Beethoven, Schubert, Weber, Mendelssohn, Rossini, Schumann, Wagner, and all composers of note have given the horns a most important place in their works. See article 'Horn' in Grove's *Dictionary of Music*.

POSTHORN, a straight brass or copper instrument, varying from 2 to 4 feet in length, and somewhat resembling the bugle in its taper bore: it has a small cupped mouthpiece. It was used as a signal instrument by the guards of mail-coaches, but has occasionally been introduced into light music. It has the same open notes as the Bugle (q.v.). The hunting-horn, used in England, is a shorter instrument of the same kind. The Sax-horn (q.v.) is a different instrument.

Hornbeam (*Carpinus*), a genus of the natural order Betulaceae, consisting of trees with compact, tough, hard wood; bark almost smooth and of a whitish-gray colour, deciduous leaves, and monocious flowers. The male catkins are cylindrical and sessile; their flowers consist merely of a little scale-like bract and twelve to twenty-four stamens. The female catkins are slender, several inches long when in fruit, and conspicuous for their long leaf-like bracts, and containing small, ovoid, prominently

Common Hornbeam (*Carpinus betulus*):

a, male catkin; b, female catkin, fully developed; c, fruit.

ribbed nuts. The flowers appear in spring as the leaves come out. Such are the characteristics of the Common Hornbeam (*Carpinus betulus*), which

is believed to be indigenous to Britain, but is best known as a plantation tree. It has a wide range of distribution on the continent of Europe.

The tree attains a height of from 30 to 80 feet—rarely the latter. The wood is white, very compact, hard, and tough, but does not now rank high commercially. It is occasionally used by joiners, turners, and wheelwrights, but, being capable of receiving a fine polish, is more in demand for purposes of ornament than utility. It was formerly in Britain, and is yet in many parts of Europe, preferred for making yokes for cattle—hence, according to some authorities, the name hornbeam. It is one of the best of firewoods, and, the leaves, like those of the beech, being persistent in winter, it is employed as a hedge plant for purposes of shelter. There are a very few other species of *Carpinus* natives of Europe, Asia, and North America, differing chiefly in the size and shape of the fruiting bracts.

Hornbill, a name applicable to any member of the family Bucerotidae, arboreal birds of Africa, India, and the Malayan region, notable for the very strong bill surmounted by a bony casque or helmet. This may increase the hammering power of the skull and at the same time protect the brain.

Most hornbills are large birds (up to 4 feet in length); they are predominantly frugivorous and insectivorous; they fly heavily and with some noise; 'the characteristic note is intermediate between the baw of an ass and the shriek of a railway engine.' The female nests in a hole in a tree, and the entrance is reduced by various kinds of plaster to a small hole, through which the male bird jerks food into his mate's mouth. The imprisoning is ascribed by some to the male, by others to the female. The food boluses are often enclosed in a

Hornbill (*Buceros rhinoceros*).

sort of skin, probably in most cases of the nature of a secretion, though sometimes it seems to be the lining of the gizzard. The dingy white eggs vary from 1 to 4 in number. The male bird sometimes succumbs to his great exertions. See Pycraft's *History of Birds* (1910).

Hornblende, an important rock-forming mineral, having much the same composition as augite. It is considered to be an isomorphous mixture of silicate of magnesia and lime and silicate of iron and lime, combined with an aluminous silicate of lime and magnesia. It crystallises in monoclinic form; has a hardness=5.5 to 6; and specific gravity = 3.1 to 3.3. There are two tolerably well-marked varieties—viz. *common hornblende* and *basaltic hornblende*. Common hornblende is dark-green to raven-black, and is characteristic of many crystalline schists and plutonic rocks. It generally takes the form of long prismatic crystals, but is sometimes massive, fibrous, and radiating. Basaltic hornblende is generally brownish-black to pitch-black, and the crystals are usually short and well formed. It occurs as a primary constituent of many eruptive rocks.

Smaragdite is a peculiar grass-green lamellar form of hornblende, characteristic of the rock Eclogite.

Hornbook, the primer or apparatus for learning the elements of reading, used in England before the days of printing, and common down to the time of George II. It consisted of a single leaf, containing on one side the alphabet large and small, in black letter or in Roman, with perhaps a small regiment of monosyllables. Then followed a form of exorcism and the Lord's Prayer, and as a finale, the Roman numerals. The leaf was usually set in a frame of wood, with a slice of transparent horn in front—hence the name of *horn-book*. There was a handle to hold it by, and usually this handle had a hole for a string, whereby the apparatus was slung to the girdle of the scholar. Sometimes the leaf was simply pasted against a slice of horn. At first the leaf was of vellum, with the characters in writing; latterly, of paper, and printed. The hornbook was prefaced and otherwise ornamented with figures of the cross, and hence came to be often called Christ Cross Row, or Criss Cross Row. Common as hornbooks at one time were, copies of them are now exceedingly rare. See the elaborate monograph by A. W. Tuer, the *History of the Horn Book*, with illustrations and fac-similes (2 vols. 1896); and Halliwell's *Fugitive Tracts* (1849). Allusions to the hornbook abound in the older writers; thus Shenstone, in his *Schoolmistress*, tells us of the children, how

Their books of stature small they take in hand,
Which with pellucid horn secured are,
To save from fingers wet the letters fair.

Horncastle, an ancient market-town of Lincolnshire, at the foot of the Wolds, between the confluent Bain and Waring, 21 miles E. of Lincoln. It has a handsome Perpendicular church, and a great August horse-fair, to which Borrow devotes eleven chapters of the *Romany Rye*. Roman remains have been found here, and in the neighbourhood are Scivelsby, long the seat of the Dymokes, champions of England; Winceby, the scene of a Royalist defeat (1643); Woodhall Spa, with a salt-spring discovered in 1820; and the site of the Cistercian abbey of Revesby (1142). Pop. 3400. See Weir's *History of Horncastle* (1820).

Horne, JOHN, geologist, born 1st January 1848 at Campsie, and educated at Glasgow High School and University, entered the Geological Survey in 1867, became assistant director in 1901, and retired in 1911. In his work and in his honours he has been closely associated with Dr B. N. Peach.

Horne, RICHARD HENRY 'HENGIST,' a bright and vigorous writer, born on New-year's Day 1803. He was educated at Sandhurst, but from love of adventure found his way into the Mexican naval service, and took his share in all the fighting that was going at Vera Cruz, San Juan Ulloa, and elsewhere. After passing through perils of all kinds, from yellow fever, sharks, broken ribs, shipwreck, mutiny, and fire, he reached England in safety, and plunged into a busy life of letters, writing poetry and prose alternately and with equal excellence. His famous epic *Orion* he published at the price of one farthing in 1843, to show his contempt for a public that would not buy poetry. In 1852 he went to Australia to dig for gold, and quickly became a person of consequence in the colony of Victoria; but he returned to England in 1869, dissatisfied with the government's failure to implement its obligations. He maintained the same incessant activity almost up to the close of life, his iron constitution braced by the swimming and athletic feats in which since boyhood he had been foremost. He died 13th March 1884. Among his books may be named *Exposition of the False Medium and Barriers excluding Men of Genius*

from the Public (1833), *A New Spirit of the Age* (1844), in which he was helped by E. B. Browning; and *Australian Facts and Prospects* (1859); two tragedies, *Cosmo de' Medici* (1837) and *The Death of Marlowe* (1837); *Judas Iscariot: a Miracle Play* (1848); and *The Dreamer and the Worker* (1851). Mrs Browning's letters to him were collected in 1877. He took the name Hengist when in Australia.

Horne, THOMAS HARTWELL, biblical critic, born October 20, 1780, was educated at Christ's Hospital, and afterwards became clerk to a barrister. His leisure hours were devoted to the study of the Bible, and in 1818 he published his *Introduction to the Critical Study and Knowledge of the Holy Scriptures*, a work which procured for him admission into orders without the usual preliminaries. Subsequently, St John's College, Cambridge, granted him the degree of B.D., and the University of Pennsylvania that of D.D. In 1833 he obtained a rectory in London; and he was also made a prebendary of St Paul's Cathedral. In the course of a long life Horne published a large number of theological works, and died 27th June 1860. The *Introduction* became a very popular authority and passed through many editions. See the *Reminiscences of T. H. Horn*, by his daughter (1862).

Hornea, a fossil land-plant (*Hornea Lignieri*) found in the Old Red Sandstone at Rhynie, Aberdeenshire, placed along with Rhynia in the order Rhyniaceæ (q.v.).

Horned Screamer. See SCREAMER.

Horned Toad, a popular name for two entirely different kinds of animals, (1) S. American toads of the genus *Ceratophrys*, some species of which have a composite bony shield on the back, and (2) certain squat Iguanid lizards (*Phrynosoma*) inhabiting the western half of the United States and Central America, remarkable in many ways. See AMPHIBIA, LIZARD.

Horned Viper. See CERASTES.

Hornell, a city of New York, 91 miles SE. of Buffalo by rail, with railway workshops, and manufactures of mowing-machines, shoes, &c.; pop. 15,000.

Horner, FRANCIS, was born at Edinburgh, 29th August 1778, a merchant's son of mixed English and Scottish ancestry. From the High School he passed at fourteen to the university, and, after three years there, spent two more with a clergyman in Middlesex, there to 'unlearn' his broad native dialect. On his return (1797) he was called to the Scottish bar, from which in 1802 he removed to the English; and in 1806 entered parliament as Whig member for St Ives. He had made his mark in the House as a political economist, when, at the early age of thirty-eight, he died of consumption at Pisa, 8th February 1817. There is a statue of him by Chantrey in Westminster Abbey; but himself he left little to preserve his name, beyond some contributions to the *Edinburgh Review* (q.v.), of which he was one of the founders. Yet, in Lord Cockburn's words, he was 'possessed of greater public influence than any other private man, and admired, beloved, trusted, and deplored by all except the heartless or the base.' And this, he explains, was due, not to rank, wealth, office, talents, eloquence, or fascination of manner, but merely to 'sense, industry, good principles, and a good heart—to force of character.' See *Horner's Memoir and Correspondence* (2 vols. 1843), and Cockburn's *Memorials of his Time* (1856).

Hornet (*Vespa crabro*), the largest species of wasp found in Britain. It is not uncommon in some parts of England, but is not found in Scotland. It measures about an inch in length, and

is predominantly brown or brownish-red, with some yellow on head, abdomen, and wings. The insects lick the sap of trees and are very partial to sweet things, such as fruit, the secretion of aphides, &c. At times, however, they are markedly carnivorous.

The females have formidable retractile stings. The nest, which is built in a hollow tree, in an outhouse, or in some other sheltered place, is composed of a coarse papery material manufactured from bark. The community of males, females, and workers is not supposed ever to include more than about 200 individuals, all of them the offspring of a single female, which, having survived the winter in some sheltered hiding-place, laid the foundation of her nest in spring. The hornet is common throughout Europe, and is represented in the United States by the White-faced Hornet (*V. maculata*), also a large species. See WASP.

Hornet (*Vespa crabro*).

Horning, in Scots law. See EXECUTION.

Hornpipe is the name of an English dance, probably named after an obsolete musical instrument. Many popular hornpipes are familiar, such as the College hornpipe, &c. Those best known are in common time.

Horn-Silver. See SILVER, PHOTOGRAPHY.

Hornstone, an impure variety of flint, with a very splintery fracture.

Horn-work, in Fortification, is a capacious form of advanced work formerly much used. The head is a bastioned front, and therefore self-flanking, while the sides or branches are flanked from the works in rear. If, instead of a single bastioned front, the work has two bastioned fronts, it is called a *Crown-work* (q.v.), and if three, a *double crown-work*. The position of these works is outside the glacis. There were good examples in the old fortifications of Strasburg. See also FORTIFICATION.

Horodenka, a town of Eastern Galicia, 106 miles SE. of Lemberg; pop. 11,000.

Horology (Lat. *horologium*, Gr. *hōrologion*, 'a sun-dial,' 'a water-clock'; Gr. *hōra*, 'a season,' 'an hour,' and *-logion*, from *legein*, 'to tell'; compare Old Eng. *horologe*, Fr. *horloge*, 'a clock'), the science which treats of the construction of machines for telling the time. Although it is easy to look back to a period when time, according to the modern conception of it, as measured by hours and minutes and seconds, was unknown, yet we find progress early made in the measurement of larger periods of time, by observations of the heavenly bodies. Thus, time was early divided into years according to the apparent motion of the sun among the constellations; into months by the revolution of the moon round the earth; and into days by the alternate light and darkness caused by the rising and setting of the sun. It was long, however, before any accurate measure was found for a division of the day itself. The earliest measure employed for this purpose that we can trace is the shadow of an upright object, which gave a rough measure of time by the variations in its length and position. This suggested the invention of sun-dials (see DIAL). Another means early adopted for the measurement of short periods of

time was by noting the quantity of water discharged through a small orifice in the containing vessel. Instruments for the measurement of time on this principle were called Clepsydre (q.v.). The running of fine sand from one vessel into another was found to afford a still more certain measure, and hence the invention of the Hour-glass (q.v.). King Alfred is said to have observed the lapse of time by noting the gradual shortening of a lighted candle.

It is not very easy to trace to its source the history of the invention to which the modern clock owes its parentage, as there are many vague allusions to horologes from a very early period; but whether these were some form of water-clock or wheel-and-weight clock is uncertain. But there seems little reason to doubt that Gerbert, a distinguished Benedictine monk (afterwards Pope Sylvester II.), made a clock for Magdeburg in 996, which had a weight for motive power; and that weight-clocks began to be used in the monasteries of Europe in the 11th century; though it is probable that these only struck a bell at certain intervals as a call to prayers, and had no dial to show the time. St Paul's Cathedral had a 'clock-keeper' in 1286, and presumably a clock; and Westminster possessed one about 1290, and Canterbury Cathedral about 1292. An entry in the patent rolls of the eleventh year of Edward II. (1318) proves that Exeter Cathedral had a clock in that year, and St Albans, Glastonbury, Padua, Strasburg, and many other places possessed them in the first half of the 14th century. The St Albans clock was a famous astronomical one made by Richard de Wallingford, who was son of a blacksmith of St Albans, and afterwards became abbot there (1326-34). The clock made for Glastonbury Abbey by Peter Lightfoot, a resident monk (c. 1325), was removed in Henry VIII.'s reign to Wells Cathedral, where its outer parts remain. The works are now at South Kensington; as is also a clock from Dover Castle, bearing the date 1348, and the initials R.L. in monogram. The original great clock at Strasburg Cathedral was made in the years 1352-70 (remodelled and reconstructed in 1571-74). A clock much superior to anything preceding it was that made by Henry de Vick (or Wick) for the tower of Charles V.'s palace at Paris in 1370-79. It was said to be on the bell of this clock that the signal was given for the massacre of St Bartholomew, 1572. By successive improvements clocks have gradually developed into the beautiful pieces of mechanism of the present day. Many curious and interesting specimens, such as that of Strasburg (q.v.) (1594), Lyons Cathedral (1598), St Dunstan's, London (1671; removed to a house in Regent's Park, 1831), and many others, have an historical interest. Many curiosities of mechanism are still constructed in the name of clocks, but generally eccentricity is their only feature. Those interested in the subject will find much information in Wood's *Curiosities of Clocks and Watches* (1866).

The date when portable clocks were first made cannot be determined. They are mentioned in the beginning of the 14th century. The motive power must have been a mainspring instead of a weight. The Society of Antiquaries of England possesses one with the inscription in Bohemian that it was made at Prague by Jacob Zech in 1525. It has a spring as motive power with fusee, and is one of the oldest portable clocks in a perfect state in England.

Illuminated clock dials, to shine at night, were introduced in the first quarter of the 19th century.

Clocks are of many and various kinds—striking and non-striking—turret-clocks big enough to carry hands 6 to 10 feet long and to ring a bell to be heard at 20 miles' distance, the good old-

fashioned eight-day clock with its long case, the ornamental drawing-room spring clocks, Dutch clocks, American clocks, and an infinity of others. Technically, those which strike are called *clocks*, and those which do not strike, *timepieces*, irrespective of size. But, however much they may vary in size and appearance, they are all founded on the same principle, and it will answer our present purpose to illustrate that principle in its more ordinary form of the household clock.

Fig. 1 represents a diagram of a non-striking timepiece. A weight, by turning a barrel, *a*, on which its cord is wound, sets in motion a train of wheels, *b*, *c*, terminating in the crown-wheel or escapement-wheel, *d*. These wheels are set between two plates which are fixed together by four pillars, one at each corner; the pillars are riveted into the back plate, *k*, and fastened with movable pins into the front plate, *k'*. The dial, removed in the fig., is also pinned on to the front plate by four short pillars or feet. The teeth in the pinions and wheels are so arranged in number that, while the crown-wheel revolves in 60 seconds, the centre wheel, *b*, takes an hour to do so. To regulate the speed at which the clock shall move, an arrangement called an escapement, *e* (to be afterwards more fully described), communicates by means of its *crutch* (at *f*) with the pendulum, *g*, which is suspended by a spring from the cock at *h*. The arbor of the barrel extends in a square form to the dial at *i*, where it is wound up; a ratchet preventing its unwinding without turning the wheel with it. The hands have a separate train of wheels, called the dial or motion train, between the front plate and the dial. The arbor of the centre wheel, *b*, is produced to the dial, and on it is put the minute-wheel, revolving once an hour, with a long socket on which the minute-hand is fixed. Over this is placed a larger wheel, the hour-wheel, *l*, revolving in twelve hours, which is set in motion by the pinion of a duplicate minute-wheel, *m* (and also seen at *h*, fig. 6). The attachment of the minute-wheel to the centre-wheel arbor is, by means of a spring, enough to ensure the hands being carried round with the clock, but not enough to prevent the hands being turned, when necessary, by hand, without disturbing the interior works.

Striking-clocks have an additional train of wheels with separate weight (or spring) for the striking; it will be described further on.

Spring-clocks—i.e. clocks having a coiled spring as a motive power instead of a falling weight—have an arrangement of barrel and fusee chain similar to that of the watch, to be afterwards described. The spring is used when it is wished to save space, as the necessary fall of a weight requires a case deep enough to hold it, something about 4 feet for an eight-day clock. Their size also necessitates a short pendulum, which, of course, does not indicate seconds.

Previous to the invention of the pendulum, the

Fig. 1.

regulating apparatus was generally as shown in fig. 2, which represents part of De Vick's clock already mentioned. The teeth of the escapement-wheel, I, acting on the

Fig. 2.

means of numerous notches, their position could be shifted till the proper speed was secured.

The great epoch in the history of horology was the introduction of the Pendulum (q.v.) as a regulating power. This has generally been attributed to Christian Huygens (q.v.), who was undoubtedly the first to bring it into practical use (1657). The fact of the actual invention, however, is obscure, and Lord Grimthorpe says: 'The first pendulum clock was made for St Paul's church, in Covent Garden, by Harris, a London clock-maker, in 1621, though the credit of the invention was claimed also by Huygens himself, and by Galileo's son, and Avicenna, and the celebrated Dr Hooke.' In adapting the pendulum to the clocks previously existing Huygens had only to add a new wheel and pinion to the movement, to enable him to place the crown-wheel and spindle in a horizontal instead of a perpendicular position, so that the balance, instead of being horizontal as in De Vick's clock, should be perpendicular and extended downwards, forming a pendulum at one end.

The principle of construction adopted by Huygens, from the peculiar action of the levers and spindle, required a light pendulum and great arcs of oscillation; and it was consequently said that 'Huygens's clock governed the pendulum, whereas the pendulum ought to govern the clock.' About ten years afterwards the celebrated Dr Hooke invented an escapement which enabled a less maintaining power to impel a heavier pendulum. The pendulum, too, making smaller arcs of vibration, was less resisted by the air, and therefore performed its motion with greater regularity. This device is called the *anchor* escapement. It was brought by Hooke before the notice of the Royal Society in 1666; and was practically introduced into the art of clock-making by Clement, a London clock-maker, in 1680. It is the escapement still most usually employed in ordinary English clocks. Fig. 3 represents the more modern form of the

Fig. 3.

swings to the right AC rises, and a tooth escapes from C, while another falls on the outside of B, and, owing to the form of the pallet B, the train goes back during the remainder of the

swing. The same thing occurs on the pendulum's return; the arm AB rises, a tooth escapes from B, and another falls on the inside of C and backs the wheelwork as before. As each of the thirty teeth of the wheel thus acts twice on the pallets, at B and again at C, it follows that a hand fixed on its arbor will move forward $\frac{1}{30}$ th of a circle with each vibration of the pendulum and mark seconds on the dial. At each contact the onward pressure of the wheel gives an impulse to the pendulum, communicated through the crutch, sufficient to counteract the retarding effects of the resistance of the air and friction, which would otherwise bring it to a standstill. The length of a pendulum oscillating seconds is, for the latitude of London, about 39.14 inches.

The defect of Hooke's escapement is the recoil, and various modifications have been devised to obviate this. The first and most successful was made by George Graham, an English watch-maker, in the beginning of the 18th century, and his improved form is called the *dead-beat* escapement (fig. 4). There the outer surface of B and inner surface of C are arcs of circles whose centre is A, and a little consideration will show that there can be no recoil. This escapement is adopted in time-keepers when great accuracy is required.

Fig. 4.

Many other escapements for clocks have been devised; but no one seems to have met with general favour except a certain form of *remontoire* or *gravity* escapement. The form of it shown in fig. 5 is called the *double three-legged* escapement, and was invented for the great clock at Westminster, in 1854, by E. B. Denison (afterwards Lord Grimthorpe). In this clock the pendulum is 13 feet $\frac{1}{2}$ inch long, to vibrate in two seconds, and its bob weighs 6 cwt. The escapement consists of two gravity impulse pallets, AB and AC, moving on pivots at A. The escape-wheel consists of two three-legged wheels, *abc* and *def*, squared on one arbor a little distance apart, with three lifting

Fig. 5.

pins (or three-leaved pinion) fixed between them. The three pins are shown by the three dots in the centre of the fig. The legs of the wheels are generally arranged alternately as in the fig. The pallets, with their arms *g* and *h*, lie between the wheels; at C is a block to lock the legs *abc*, and at B, on the other side, and of course acting in the reverse direction, is another to lock the legs *def*. The leg *a* is, in the fig., locked on the block at C. The pendulum, part of which is removed to show the escape-wheel, is supposed to be moving in the direction of the arrow, and has received impulse from the falling pallet AB at *i*; it is just beginning to touch the other pallet at *k*,

which has been kept in position clear of the pendulum by one of the centre pins bearing on the arm *g*. The pendulum before turning again moves the pallet AC just enough to allow the leg

a to escape from the locking-block at *C*; the wheel flies round, impelled by the clock-weight, till the leg *f* locks on the block at *B*; by the same movement the pin which is seen near the end of the arm *h* pushes the pallet *AB* away from the pendulum, which now gets impulse from the fall of the pallet *AC*. This goes on at each side alternately, the pallets being raised by the clock train, the pendulum only unlocking them. To make the motion go smoothly and prevent jar, a fly is attached to the arbor of the escape-wheel by a spring; it is seen in the figure. As the height to which the pallets are lifted is the same, however unequal the force communicated by the train may be, the arc of vibration of the pendulum remains constant, as the weight of the arm and the distance it falls are always the same.

The gradual perfection of the clock required also improvements in the regulating power which finally resulted in the compensation pendulum (see **PENDULUM**).

The improvements in the escapement and the pendulum bring the mechanical perfection of the clock, as a time-keeping instrument, to the point which it has attained at the present day. But the art of horology would be incomplete unless there were some standard, independent of individual mechanical contrivances, by which the errors of each may be corrected. This standard is supplied by observatories, and the methods by which time is determined belong to the details of practical astronomy. There are in most parts of the United Kingdom now sufficient opportunities of setting clocks by a communication more or less direct with these establishments. When these are not to be had the sun-dial may still be used with advantage as a means of approximation to the correct time. The time which a clock ought to mark is *mean time*, the definition of which will be found in the articles **DAY** and **TIME**. The *mean time* at any place depends on the longitude. Supposing a clock to be set to Greenwich mean time, a clock keeping mean time of any place will be 4 minutes faster for every degree of longitude east of Greenwich, and 4 minutes slower for every degree west. Since the introduction of railways, clocks are usually set within Great Britain to Greenwich mean time. In the United States, where the extent of country makes it undesirable to use the mean time of one meridian, four standard meridians were adopted in 1883—viz. 75°, 90°, 105°, 120° west of Greenwich. Clocks showing 'Eastern,' 'Central,' 'Mountain,' and 'Pacific' time are therefore respectively five, six, seven, or eight hours slower than Greenwich mean time.

For the more ready transmission of correct time to the public there is at Greenwich Observatory, as well as some others, a ball which is dropped by means of electricity precisely at one o'clock. From the Eiffel Tower, Nauen, and elsewhere wireless time-signals are sent out. Several methods have been used to keep the public clocks of a town in perfect agreement with the mean-time clock in the observatory. One means of effecting this by an electric connection and a modification of Bain's electric pendulum (1840), due to R. L. Jones of Chester (1857), is described at **ELECTRIC CLOCKS**. Some towns have time-guns. Thus a clock in the castle of Edinburgh, by whose mechanism a gun is fired precisely at one o'clock every day, is controlled by the mean-time clock in the observatory on Blackford Hill.

It is not known when the alarm or when the striking-mechanism of the clock was first applied. The first striking-clock probably announced the hour by a single blow, as they still do in churches to avoid noise. During the 17th century there existed a great taste for striking-clocks, and hence

a great variety of them. Several of Tompion's (died 1713) clocks not only struck the quarters on eight bells, but also the hour after each quarter.

The striking part of a clock (see fig. 6, which shows an English striking-clock by Ellicott, taken

Fig. 6.

from the engraving in Moinet's work) is a peculiar and intricate piece of mechanism. The motive power is a weight used in a similar manner to that in the time-keeping train shown in fig. 1. In fig. 6, *a*, *b*, *c*, *d*, *e* are the striking-train; *e* is a fly which acts as a drag to prevent the striking being too rapid. The striking-train is kept in a normal condition of rest by the tumbler or gathering pallet *f*, fixed to the prolonged arbor of the wheel *c*, being caught by the pin at the end of the rack *g*. A few minutes before the hour, a pin on the wheel, *h*, of the dial-train, raises the arm, *i*, of the lifter *j*, *k*, *l*, which in turn lifts the lever *m*, which has by means of its hook been holding the rack, *g*, fixed. The tail end, *n*, of the rack is then forced by the spring, *o*, against the 'snail' *p*. The snail is attached to the hour-wheel of the dial-train (see fig. 1), and consequently revolves in twelve hours, and has a step for every hour. The rack, in falling on it, is freed to the extent of a tooth (i.e. a tooth gets past the hook at *m*) for every step of the snail. As shown in the fig., one tooth would be freed, and the result would be that the clock would strike one; when the last step of the snail is reached, twelve would be struck. The result of this movement is that the striking-train moves a little till a pin on the wheel *d* catches on the end of the lifter *l*, which is turned down through a hole in the plate for the purpose. The resulting sound is called 'warning.' Precisely at the hour the pin on the wheel *h* slips past the end, *i*, of the lifter, which falls, relieving the striking-train; the hours are struck on the bell *r*, by the hammer *s*, acted on by the pins on the wheel *b*. As the tumbler attached to the wheel *c* revolves once for every stroke of the bell, it *gathers* up a notch of the rack at each revolution, until it is stopped by a return to its original position of rest at the pin on the rack *g*. The rack, lever, and lifting-piece are *above* the front

plate, and are pivoted on studs fixed into it. A lever, *t*, moved by a pointer on the dial, throws the striking work out of gear when the clock is required to be silent. In the fig. *u* is an extra wheel for driving a hand to show the days of the month.

Clocks which chime the quarters and half-hours have generally a third train of wheels for the chiming.

In England clocks are principally made in London and Handsworth near Birmingham, though there are many small local makers. Many of the ornamental clocks and timepieces are manufactured in France.

Dutch or wooden clocks were first introduced about the middle of the 17th century. Though made on the same principle as ordinary clocks, their arrangements are much simplified, and their principal parts made of wood and wire, only the actual wheels being brass. They are very cheap, and consequently became very common in lower-class households and kitchens. They are made in the Black Forest in Germany, and, considering their mode of manufacture, are wonderfully accurate as timekeepers when properly taken care of.

They are now rapidly being superseded by *American clocks*, which, on account of their cheapness, neatness, and portability, have become very popular. Their manufacture is a great industry in the United States, at Waterbury in Connecticut, Brooklyn, New York, and many other places. The wheels and plates are stamped, and very little manual labour is spent on them, every part being interchangeable in similar-sized clocks. Their appearance is too familiar to require a detailed description. To many of these cheap clocks alarms are fitted, which can be set to sound at any hour. See ALARM.

Watches.—The modern perfect watch and chronometer may be said to be the result of a gradual development from the early clock rather than that of any particular invention. The first step was obviously to find some other form of power than the weight; and this was made in the end of the 15th century by the invention of the coiled spring as a motive power, but where, or by whom, is uncertain.

It seems to be taken for granted that Peter Hele, a mechanic of Nuremberg, as early as 1490 made small pocket clocks of steel which showed and struck the hours, and were driven by a coiled spring. These from their oval shape were called Nuremberg eggs. The next step was the invention of the fusee, an arrangement to overcome the weakening of the spring as it became uncoiled. This also is involved in obscurity, though it must have occurred early in the 16th century, as the clock mentioned as made by Jacob Zech in 1525 has that modification. At first a gut cord was used, the chain being a modern invention. The balance used was exactly like that of De Vick's clock (fig. 2), except that the weights on the arms of it were fixed instead of hanging. The next step of any consequence was the invention of the balance-spring by Dr Hooke in 1658-60, which was the foundation of all the varied improvements resulting in the almost perfect chronometer compensation-balance of the present day.

Although watches were introduced into England in Henry VIII.'s time, they did not come into general use till the reign of Elizabeth, and then their cost confined them to the wealthy. At first they were very large, on account of their striking part; and their cases, without glass, were pierced with elaborate open work to let out the sound of the bell. When the striking work was dispensed

with, they of course became much smaller, and gradually drifted into being ornamental rather than useful. They were richly ornamented with pictures in enamel, set in the heads of walking-sticks, in bracelets, in finger-rings, and enriched with the most costly jewels. They were encased in crystal and in imitation skulls, and in fact became subject to all the vicissitudes of fashion, through which it would be needless for us to follow them. The curious will find much entertaining matter in Wood's work already referred to. Previous to the invention of the balance-spring, watches (as also clocks) had only one hand, which showed the hours; but after that event the greater power of regulating the motion led to the introduction of extra wheels to carry minute, and finally seconds, hands.

The watch is essentially a miniature edition of the ordinary spring-clock, except in two points—viz. that it has a balance-spring instead of a short pendulum, and that, as the escapement-wheel revolves in about six seconds, an extra wheel revolving in a minute is introduced to carry the seconds hand.

The train of an ordinary verge watch is shown in fig. 7: *a* is the barrel enclosing the mainspring and turning, by means of the fusee chain *b*, the fusee and great wheel *c*, and, through the pinions and wheels *d*, *e*, *f*, the escape-wheel *g*. The hands

Fig. 7.

or motion train are exactly as described for clocks, and are similarly carried by the elongated arbor of the centre-wheel *d*. As will be seen in the fig., the fusee is of a peculiar shape. The reason is as follows: When the chain, which is fixed at the broadest part of the fusee, is fully wound up, it goes from the narrow part to the barrel where the other end is fixed, and of course the spring is also fully wound. At this point the spring is strongest; and, pulling upon the narrow end of the fusee, has the least leverage. As it gradually unwinds, and at the same time becomes weaker, the leverage, owing to the shape of the fusee, becomes in exactly the same ratio greater, and thus the power on the machinery is equalised till the whole chain is unwound. The spring is wound up by the squared arbor, *m*, of the fusee through an opening in the inside case; the arbor of the spring-barrel being of course fixed. An ingenious stop arrangement prevents the possibility of damage by over-winding. The mainspring is a thin ribbon of finely tempered steel (fig. 8). The inner end is hooked on to a catch on the arbor of the barrel round which it is coiled, and the outer end to a catch on the inside of the rim of the barrel. In the American watches, now so common, the fusee is dispensed with, and the great wheel is on the barrel and directly gives the motion. In recent years this form is also used in almost all keyless watches. The verge escapement shown in fig. 7 is exactly the same as that shown in De Vick's clock (fig. 2). Two pallets, *h*, *i*, moved alternately in opposite directions by the teeth of the escapement-wheel, cause a vibrating motion

Fig. 8.

in the balance k , which is steadied and regulated by the balance-spring l . The balance and spring are shown in plan in fig. 9: a is the balance and b the spring, which is arranged spirally. The inner end is fixed to the staff of the balance, the outer to a stud c , fixed to the watch-plate. Its beautifully delicate motion may be observed in any watch, as all watches have the spiral spring except chronometers, which have a cylindrically coiled spring instead. The length of the balance-spring

Fig. 9.

in proportion to the weight of the balance is an important factor in regularity of motion, and for minute adjustment an instrument, d , e , called a *regulator* is attached to it. Two curbs-pins at d enclose the outer coil of the spring, and, in the case of the watch going fast, a movement to the left lengthens the spring and retards the speed in proportion. For too slow a motion a movement to the right will shorten the spring and quicken it.

The principle involved in the clock-pendulum and watch-balance alike is that by their regularity of movement they shall keep the mechanism from going either too fast or too slow, and that in return the mechanism shall give repeated impulses sufficient to keep them perpetually in motion.

Fig. 10.

As the vertical or verge escapement, owing to the recoil of the escape-wheel and other causes, is not to be depended on for very great accuracy, attempts were immediately made after the invention of the balance-spring to devise some form of escapement which would give better results. Hooke, Huygens, Hautefeuille, and Tompion introduced improvements, but the first to succeed was made by George Graham, the inventor of the dead-beat escapement in clocks.

Fig. 11.

This is called the *horizontal* or *cylinder* escapement (fig. 10). It was introduced in the beginning of the 18th century, and it is still the escapement used in many foreign watches. The impulse is given to a hollow cut in the cylindrical axis of the balance by teeth of a peculiar form projecting from a horizontal crown-wheel.

Other forms of escapement in high estimation are the *lever*, the *duplex*, and the *chronometer* 'spring-detent' escapement. The lever escapement (invented about 1770 by Thomas Mudge) is the dead-beat escapement (see fig. 4) adapted to the altered conditions of a watch. Fig. 11 shows the form used in most modern English watches. The pallets, P , P , are fixed to a lever, A (pivoted at F), and there is an impulse pin, B (usually a piece of ruby), set in a small

disc, C (called the roller), on the axis of the balance. The ruby pin works into a notch at the end of the lever, and the pin and notch are so adjusted that when a tooth of the escape-wheel D leaves the pallet the pin slips out of the notch, and the balance is detached from the lever during the remainder of its swing; whence the name *detached* lever escapement, originally applied to this arrangement. On the balance returning, the pin again enters the notch, moving the lever just enough to allow the tooth next in order to escape from the dead face of the pallet on to the impulse face; then the escape-wheel acts upon the lever and balance; the tooth escapes, and another drops upon the dead face of the pallet, the pin at the same time passing out of the notch in the other direction, leaving the balance again free. This arrangement is found to give great accuracy and steadiness of performance. A safety pin, E , on the lever, prevents the wheel being unlocked, except when the impulse-pin is in the notch of the lever. Two *banking-pins*, GG , keep the motion of the lever within the desired limits.

In the duplex escapement (invented about 1780) the escape-wheel has two sets of teeth, hence the name. One set, something like the lever-wheel (fig. 11), lock the wheel by pressing on the balance staff, and the other, standing up from the side of the rim of the wheel, give impulse to the balance. It is rarely used now.

The chronometer spring-detent escapement was invented in principle by Le Roy about 1765, and perfected by Earnshaw (who also invented the cylindrical balance-spring) and Arnold about 1780. It is shown in fig. 12; a is the escape-wheel, which has fifteen teeth; b , the impulse-roller, fixed on the same staff as the balance; c , the impulse-pallet; d , discharge-pallet; e , locking-pallet—all the pallets are of ruby or sapphire; f , the blade of the detent fixed at k by its spring g ; and h , the gold-spring. In the fig. a tooth of the escape-wheel is caught on the locking-pallet; the discharge-pallet (carried round by the roller in the direction of the arrow), by pressing on the end of the gold-spring, which in turn presses on the horn of the detent i , bends the detent enough to allow the tooth to escape from the pallet. The escape-wheel, being released, overtakes the impulse-pallet and drives it on till their paths diverge and they separate. The wheel is again brought to a

Fig. 12.

stand by the locking-pallet of the detent, which, on being released by the discharge-pallet, has sprung back to its original position. The roller, having made its vibration, is brought back by the spring. In the return the discharge-pallet forces itself past the end of the gold-spring, the impulse-pallet clears the teeth of the escape-wheel, and the balance goes on till the momentum is exhausted, when the spring induces another vibration, the wheel is again unlocked, and the impulse-pallet gets another blow. By receiving impulse in one direction and unlocking at every alternate vibration only, the chronometer-balance is more thoroughly detached than any other. It is very delicate, however, and,

though the most perfect known, it cannot stand rough usage, and is not so suitable for ordinary pocket-watches as a good lever. At sea the chronometer is hung in Gimbals (q.v.), so as to be always horizontal whatever the motion of the vessel.

In watches, even more than in clocks, variations of temperature, unless provided for, produce variations in the rate of going. A rise in the temperature makes the balance expand, and therefore augments its moment of inertia. It diminishes the elasticity of the spring; and the time of vibration of the balance, which depends upon the moment of inertia directly, and upon the elastic force of the spring inversely, is increased—the watch, that is, goes more slowly. A fall in the temperature is attended by opposite results, the watch going more rapidly than before. Compensation can obviously be made in either of two ways—by an expedient for shortening the effective length of the balance-spring as the temperature rises, so as to increase the elastic force of the spring; or by an expedient for diminishing the moment of inertia of the balance as the temperature rises, so as to correspond to the diminution of the force of the spring. The first method was that made use of by John Harrison (q.v.) in his chronometer, and

Fig. 13.

it depended on a laminated bar of brass and steel fixed at one end, called a *compensation curb*; the free end carries two curb pins, which embrace the balance-spring, and, as the bar shrinks and expands, regulate the length of the spring. It is never used now. An adaptation of the other method, invented in 1782 by John Arnold, and improved by Thomas Earnshaw, is that which is always employed now.

Fig. 13 shows the form employed for marine chronometers, and fig. 14 that for pocket chronometers and watches: *t*, *a*, *t'* (fig. 13) is the main bar of the balance; and *t*, *b*, *t'*, *b'* are two compound bars, of which the outer part is of brass and the inner part of steel, carrying weights, *c*, *c'*, whose position may be shifted to or from

Fig. 14.

the fixed end, according as the compensation is found on trial to be less or more than is desired. Brass expands more with heat and contracts more with cold than steel; consequently, as the temperature rises the bars with their weights, being fixed at one end to the main bar, bend inwards at the free end, and so the moment of inertia of the balance is diminished; as it falls they bend outwards, and the moment of inertia is increased; and of course the diminution or the increase must be made exactly to correspond to the diminution or increase in the force of the spring. The screws, *d*, *d'*, fitted to the

fixed end of each of the compound bars are used for bringing the chronometer to time; sometimes the smaller ones are dispensed with. In fig. 14 the principle is the same: *a*, *a*, *a*, *a* are the time screws (equally distributed in the watch-balance); the others are for compensation, and their positions may be shifted or larger ones substituted if necessary.

The modern marine chronometer is just a large watch fitted with all the contrivances which experience has shown to be conducive to accurate time-keeping—e.g. the cylindrical balance-spring, the detached spring-detent escapement, and the compensation-balance. Harrison's chronometer, mentioned above, was the first, and was completed after many years of study in 1736. For a description, see *British Horological Journal*, vol. xx. page 120. After many trials and improvements, and two test voyages to America, undertaken for the satisfaction of the commissioners, the last of which was completed on the 18th September 1764, the reward of £20,000, which had been offered by government for the best time-keeper for ascertaining the longitude at sea, was finally awarded to him. Harrison made many other inventions and improvements in clocks and watches, including his maintaining spring to the fusee, to keep the works going while being wound; a form of remontoire escapement, &c.

Somewhat later than this several excellent chronometers were produced in France by Berthoud and Le Roy, to the latter of whom was awarded the prize by the Académie Royale des Sciences. Progress was still made in England by Mudge, Arnold, and Earnshaw, to whom prizes were awarded by the Board of Longitude. The subsequent progress of watch-making has been chiefly directed to the construction of pocket-watches on the principle of marine chronometers, and such accuracy has been obtained that the average error is reduced to one second a day.

The compensation of an ordinary balance chronometer cannot be made perfectly accurate for all degrees of temperature, but only for two points. The explanation of this lies in the fact that, while the variations of elastic force in the spring go on uniformly in proportion to the rise or fall of the temperature, the inertia of the balance varies, not inversely as the distance of its weights from the centre, but inversely as the *square* of the distance of the centre of gyration from the centre of motion.

Fig. 15.

The particular points in the case of any chronometer are matter of adjustment. For instance, one chronometer may be made to go accurately in a temperature of

40°, and also in a temperature of 80°, at other temperatures being not so accurate; another chronometer to go accurately at a temperature of 20° and 60°. It is manifest that the former would be adapted to voyages in a warmer, the latter to voyages in a colder climate. To more fully adjust the compensation certain pieces are fixed to the balance to act in heat or in cold, and this is called auxiliary compensation, and there are at least two or three balances invented of recent years, one of which is shown in fig. 15, which are practically self-adjusting for the ordinary range of temperatures to which marine chronometers are subjected. The solution of the problem seems to be in setting the laminæ flat instead of vertical, and making the bar also bimetallic.

Apparatus for testing chronometers have been long in use in the observatories at Greenwich and Liverpool. In the latter there is now an extensive apparatus for this purpose, devised by the ingenious astronomer, Mr Hartnup. In a room which is isolated from noise and changes of temperature the chronometers are arranged on a frame under a glass case, so contrived that they may be subjected in turn to any given degree of temperature. The rate of each under the different temperatures is observed and noted, and the chronometers registered accordingly.

A large proportion of modern watches are made to wind and to set the hands from the pendant. Fig. 16 shows the form of keyless work chiefly employed in English non-fusee watches. The chief part is the three wheels working in the rocking-bar *ab*, one of which gears with the winding-wheel, *d*, of the barrel when the rocking-bar, which is capable of a little motion, is in its normal place, as in the fig. A contrate wheel is fixed on the end of the winding-button *c*, and by its means,

Fig. 16.

when the button is turned, the train is set in motion and the barrel wound. When the hands are required to be set, a push-piece in the case bearing on the end, *b*, of the rocking-bar is pressed by the finger, taking the rocking-bar wheels out of gear with the winding, and putting them in gear with the hand-wheels at *c*. The hands may then be turned by the winding button, and, the push-piece being let go, the train returns to its normal position. The use of the fusee being attended with some amount of complication in the keyless mechanism, it is usually dispensed with on this account, and one of the most modern arrangements in an English keyless watch is shown in fig. 17. The barrel, *a*, is here made to occupy all the height between the pillar (or lower) plate and the top limit of the movement, and all the space between the centre pinion and the balance cock, in order to get a long, thin mainspring; the advantage of which is that there is an abundance of power (much more than is required for a day's going), and only a portion of the spring is used for the ordinary winding for twenty-four hours. This practically insures an adjustment of the motive power as nearly equal to that obtained by the use of the fusee as it is possible to arrive at.

Fig. 17.

Repeating watches were first made about 1676, the invention being claimed by Daniel Quare, Edward Barlow, and Tompion. They have a striking arrangement very much on the principle of the striking-clock, and on compressing a spring they at any time strike the hours and quarters, and in some cases the minutes. They are very expensive and liable to go out of repair, and repairs are costly. They have nearly gone out of use. For stop-second arrangements to record swift passing events, see CHRONOGRAPH.

In England watches are mostly made at Preston, Liverpool, Coventry, and at Clerkenwell, London, where the division of labour principle is carried out in an extreme degree—many small factories making, for instance, only balances, others springs, others cases, others hands, &c., only that small number who put the works together seeing the complete watch. At Kew Observatory there are arrangements for testing watches, and granting certificates if satisfactory, on payment of a fee. In the United States the manufacture of watches, like that of clocks, is carried on in a much more wholesale manner; the wheels and plates being stamped by machinery, every similar part being exactly alike and interchangeable; and on account of the economy of manual labour, they can be turned out marvellously cheap. Generally the large clock-factories also manufacture watches.

Horoscope. See ASTROLOGY.

Horrocks, JEREMIAH, generally known as the first observer of the transit of Venus, an account of which phenomenon he has given in a Latin treatise entitled *Venus in Sole visa*. He was born at Toxteth, near Liverpool, apparently in 1619; he entered Emmanuel College, Cambridge, May 18, 1632; was appointed in 1639 to the curacy of Hoole, Lancashire, in which village he made his famous observation (November 24, 1639, o.s.), while a mere youth. He died suddenly on January 3, 1641, the day before an intended journey, having promised to visit his chief friend, William Crabtree. Dr Wallis, his contemporary, informs us that Horrocks at the time of his death 'had not completed his twenty-third year.' Newton, in the *Principia*, bears honourable testimony to the value of Horrocks's astronomical work, especially commending his lunar theory as the most ingenious yet brought forward, adding, 'and, if I mistake not, the most accurate of all.' Horrocks is frequently mentioned by the scientific men of the 17th century; the observation of the transit being by no means regarded as his sole astronomical achievement, as he added to our knowledge of the physical cause of celestial motions, deduced the solar parallax, corrected the solar diameter, and made tidal observations. Hevelius printed the *Venus in Sole visa*, which first appeared in Germany (1662); a translation of this work, with memoir by Whetton, appeared at London in 1859. In 1678 Horrocks's frag-

mentary works were published under the auspices of the Royal Society, being edited by Dr Wallis, with the title *Jeremias Horroccii Opera Posthuma*, &c. The name of Jeremiah Horrocks, long forgotten except by astronomers, is now, 'after the lapse of more than two centuries,' engraven on marble in Westminster Abbey.

Horse (*Equus*), an ungulate or hoofed mammal of the order Perissodactyla, characterised by having an odd number of toes; the family Equidæ formed the group Solidungula of old writers, owing to the presence of only a single hoof, which marks them off quite sharply from all allied animals. The English name is found in Anglo-Saxon as *hors*, and is cognate with the Icelandic *hross*, German *ross*; it is sometimes referred to Sanskrit root *hresh*, 'to neigh,' but, according to some, with more probability, to an Old Teutonic *horso-*, Pre-Teutonic *kurso-*, from the root *kurs-*, 'to run,' cognate with Latin *currere*. The Latin name is no doubt from the root *ak*, conveying the idea of swiftness; Sanskrit *acva*; Gr. *hippos* or *hikkos*; Lat. *equus*.

The existing species of the genus *Equus* are about half a dozen in number: (1) The Horse (*E. caballus*) is characterised by the tail being furnished with long hairs quite from its base; by the long and flowing mane; by the possession of a bare callosity on the inner surface of the hind as well as of the fore legs; and by the head and ears being smaller and the limbs longer than in the other species. (2) The Ass (*E. asinus*) is almost as widely distributed as the horse; it is probably of African origin, being almost certainly conspecific with the Abyssinian form, *E. tæmopus*. (3) The Asiatic Ass (*E. hemionus*) differs from the common ass in being of a more reddish colour, in the absence of the shoulder stripe, and in having smaller ears. By some zoologists it is split up into three species—the Syrian Wild Ass (*E. hemippus*), the Onager (*E. onager*), and the Kiang or Dziggetai, to which the term *E. hemionus* then becomes restricted. (4) The Quagga (*E. quagga*) has dark stripes upon the head and shoulders on a brown ground; it is said to be now extinct. (5) Burchell's Zebra (*E. Burchelli*) is white, with stripes on the body and the upper parts of the limbs; it extends from the Orange River to Abyssinia.

Horse, with names of parts:

1, crest; 2, withers; 3, croup; 4, hamstring; 5, hock; 6, cannon; 7, fetlock; 8, pastern; 9, hoof; 10, coronet; 11, arm; 12, gullet; 13, muzzle.

(6) The Mountain Zebra (*E. zebra*) is white, with long black stripes reaching down to the feet. It is limited to the Cape Province, and is rapidly disappearing. These last three are sometimes united into a special genus, *Hippotigris*. (7) The explorations of the Russian traveller Przhevalski (Prejevalsky) in 1881 added another species to the list of Asiatic forms, which has been called after him. The long hairs of the tail begin only half-way down it; the mane is short and

erect, and there is no forelock; the head is large and heavy; the ears smaller than those of the ass. It inhabits the dry sultry regions of the Dzungarian Desert, living in companies of fifteen to twenty, each led by a stallion. Only two herds were observed, and only one specimen was secured. The resemblance which this species presents to the horse of early sculptures has been pointed out by several observers.

The anatomical structure of the horse has been the subject of many elaborate treatises, and only a very brief outline of its more salient features can be offered here. The skull is remarkable for its great length, especially as regards the bones of the face, which occupy an extent twice as great as those of the cranium. The orbit is approximately circular and complete behind, a fact which distinguishes the horse from the tapir and rhinoceros, as well as from its fossil allies. The co-operation of the zygomatic process in the formation of the lower part of the orbit is an unusual if not a unique feature. The great cheeks are formed mainly of the maxillary bones, though the lacrymal and malar bones occupy a considerable area in the upper portion. The nostrils are roomy, provided with extensive turbinate bones, and roofed in by the nasal bones, which are broad behind, pointed in front. In the naked skull the anterior openings of the nostrils extend far back at either side between the nasal and premaxillary bones. The palate, like the floor of the cranium, is long and narrow, forming a kind of valley between the two rows of elevated molar teeth. Below the brain-case there is a distinct canal through the alisphenoid bone for the internal maxillary artery. In the region of the ear the tympanic and periotic bones are fused together, but are loose from the skull, being held in position only by the descending process of the squamosal bone. The hyoid bone is well developed, especially as regards its anterior arch, and the basal segment sends a process forward into the tongue. The rhinoceros and tapir have a similar, but smaller, process. The mandible is very large, and the lower and hinder part is expanded into a broad flat plate for the attachment of the masseter muscle. The vertebral column is made up of seven cervical, eighteen dorsal, six lumbar, five sacral, and fifteen or more caudal vertebrae. Most of the vertebrae are more or less hollowed behind, this character being more marked in the fore than in the hinder part of the spine. The dorsal processes of the vertebrae in the forepart of the chest are very high, and to them is attached the great elastic ligament (*ligamentum nuchæ*) which relieves the muscles of the heavy weight of the head and neck. The sternum consists of six segments, the anterior one being shaped something like the prow of a boat. There are no collar-bones, these being in fact absent from all hoofed mammals (Ungulata). The shoulder-blade is long and narrow, and bears a prominent rounded tubercle, representing the coracoid bone. The humerus is short and stout; of the two bones of the forearm the ulna is well developed behind, where it forms the great process (olecranon), projecting backwards from the elbow-joint, but it tapers gradually away below, and is firmly fused with the radius. The wrist ('knee' of common speech) consists of six bones, disposed in two rows of three each; in the second row the middle bone (*os magnum*) is very large, and supports the cannon-bone, whilst the two laterals are small, and each supports a splint-bone. The fore-foot of the horse consists of only one fully-developed digit, corresponding to the middle finger of the human hand. The metacarpal bone of this finger is known as the 'cannon-bone,' and approximated to its upper end are the thin tapering rudiments of the second

and fourth metacarpals, commonly known as 'splint-bones;' the cannon-bone is succeeded by three phalanges, known respectively as the 'large pastern,' 'small pastern,' and 'coffin-bone.' Behind the foot are three small bones (sesamoids), two behind the joint between the cannon-bone and large pastern (commonly called the 'fetlock'), and a single one placed transversely behind the joint between the small pastern and the coffin-bone, commonly called the 'navicular.' In the hinder limb the thigh-bone has a prominent flattened process on its outer side, about one-third down; this is known as the 'third trochanter,' and is characteristic of all odd-toed ungulates. What is really the knee is known as the 'stifle joint.' The fibula is rudimentary. The tarsus consists of seven bones. The os calcis has a well-marked flattened heel-process, commonly known as the 'hock.' The bones of the hind-foot resemble very closely those of the fore-foot, and have the same names. A very strong ligament passes down the hinder surface of the foot, and the two smaller sesamoid bones above mentioned are imbedded in it. It is commonly known as the 'suspensory ligament of the fetlock;' occasionally muscular fibres are found in its substance, and this fact, taken in conjunction with its position and attachments, shows that it is the representative of the interosseous muscles of the human hand. The navicular bone lies in the tendon of the deep flexor muscle of the foot.

The hoof is the representative of the claws or nails of other animals. The last segment of the toe is widened out to form a foundation for it, and this is increased by cartilaginous side-pieces and a fibrous and fatty sole-piece. The integument is, of course, continuous with the skin of the limb, but it is extremely vascular, and its surface is developed into papillæ or laminae, which secrete the horny matter of the hoof. The chief share in this process is taken by the 'coronary cushion,' or thickened ring round the upper part of the foot, and by the cushion in the sole. The result of this is that the hard external tissue of the hoof is renewed from within as fast as it wears away on the outside. The lower surface which comes into contact with the ground is hollow, and its centre is occupied by the 'frog,' a triangular eminence with its apex directed forwards, and consisting of pavement epithelial cells arranged concentrically. Other horny structures are the so-called 'chest-nuts,' hard oval warts situated on the inner surface of all four legs in the horse (*E. caballus*), and of both fore-legs in the other members of the genus.

The teeth of the horse when the series is complete are forty-four in number: three incisors, one canine, four premolars, and three molars on either side of each jaw. The incisors form a semicircle: they have a pit in the apex partially filled up with bony matter, and this it is which produces the well-known appearance of concentric rings as the tooth wears away, and their disappearance when the wearing has carried the surface of the tooth beyond the bottom of the pit. The canines are either rudimentary or absent in the females. Between them and the grinding-teeth is a wide gap (diastema) in which the bit is placed. The first premolars are either quite rudimentary or absent; when present they are usually lost before maturity, so that the grinding-teeth in actual use only amount to six in number. They have very long crowns, which are gradually pushed up as the surface wears away; this peculiarity in structure is only seen in the teeth of the more recent horses, and is probably to be associated with the removal of the animal from swamps to drier plains, and hence from soft moist vegetation to food more difficult of

mastication. The enamel of the teeth forms a curved folded plate, the pattern being derivable from that seen in other Perissodactyles; and it is this which produces the characteristic pattern seen in the surface of the horse's molars. The temporary or milk teeth are twenty-four in number—three incisors and three milk-molars on either side of each jaw. At birth the first and second molars are present; at one week old the central incisors appear; at six weeks the two next incisors; at three months these incisors are level, and a third molar has come into view; at six months obliteration is apparent in the central incisors; at eight months the lateral incisors have erupted, making the full number of six in each jaw; at one year the fourth molar is visible; at eighteen months the mark is very faint in the central incisors; at two years old there are five molars; at three years the permanent central incisors replace the temporary ones; at three and a half and four and a half years respectively, the same happens with the second and the lateral incisors, and at the latter date the canines appear in the male; at five years the mark is nearly, and at six years quite effaced in the central incisors; at seven years the like has happened to the next incisors; and at eight years the mark has disappeared from all the teeth, and the canines have become blunted. Hence by the presence of the different teeth and their condition as regards wear, it is possible to tell the age of a horse with considerable accuracy up to six or eight years of age, but after that no reliable conclusions can be drawn from these organs.

The lips are flexible; the palate long and narrow, and transversely ridged; the soft palate has no uvula, and, except during the actual process of swallowing, embraces the epiglottis, so that respiration is carried on entirely through the nostrils. Three pairs of salivary glands are present, the parotid being by far the largest. The stomach is simple and a good deal curved upon itself: at the oesophageal opening is a kind of muscular valve to which is commonly attributed the difficulty which a horse experiences in vomiting. The small intestine is eighty or more feet in length, and terminates in a large cæcum with sacculated walls. The liver is almost symmetrical, and there is no gall-bladder. The heart is rather longer; the aorta gives off almost immediately a large trunk (the so-called 'anterior aorta'), which subsequently divides into the two axillary and two carotid arteries. The anterior apertures of the nostrils are large, and can be dilated by special muscles; immediately within the opening on the upper and outer side is a blind pouch ('false nostril') 2 or 3 inches in depth and of unknown function; in the ass it is even larger. There are also air-sacs in the hinder and upper part of the pharynx which spring from the Eustachian tubes. The time of pairing falls between the end of March and beginning of June. The period of gestation is eleven months, and only one foal is born at once. The mare is capable of breeding at three years old, but the stallion is not usually allowed to pair until four years of age. The average age of a horse may be put down at twenty years; the greatest age on record is believed to be sixty-two.

The senses of the horse are acute, though many animals excel it in this respect; but its faculties of observation and memory are both very highly developed. A place once visited or a road once traversed seems never to be forgotten, and many are the cases in which men have owed life and safety to these faculties in their beasts of burden.

With patience and kind treatment the horse can be trained to go through quite complicated feats of memory and perception. That it possesses also an

accurate sense of time is clear from the facility with which it can be taught to walk, trot, and dance to music, or take part in concerted evolutions. Its knowledge of tunes is evinced by its comprehension of military signals. It is very timid and cautious, and suspicious of every new sight or sound; while in respect of moral qualities it is scarcely too much to say that horses are as diverse as men.

The distant ancestors of horses were probably members of a generalised extinct group called Condylarthra, e.g. Phenacodus, with five toes on each foot. One of the earliest undoubtedly horse-like types was Eohippus (Eocene), a small creature about 11 inches high, with four toes in front and three behind. In the Oligocene there was Mesohippus, about the size of a sheep, with three toes and a vestige in front, and three behind. Among the Miocene types was Protohippus, about 36 inches high, with three toes on each foot, but only one reaching the ground. Closely related was Merychippus, perhaps the ancestor of all subsequent Equidae. In the Pliocene there was a wide representation of the genus Hipparion, most of the species still 3-toed. Also in the Pliocene *Equus* appeared—the climax of a long evolutionary progression, of which in its individual development it still offers some recapitulation. It may not be possible to trace the precise pedigree of the horse, for several collateral lines of descent are involved; but it may be said that every theoretically probable stage in the reduction of toes, complications of teeth, and so forth, is illustrated by actual fossil forms.

The etymological synopsis above given shows that the horse was known to the Aryan people before their dispersal. Incised figures of the horse upon bones have been found in cave-deposits belonging to the Palæolithic age, and there is evidence to show that at this period the animal was an object of the chase and a source of food. It was probably small and heavy, with a large head and an upright or hog-mane; and attention has been already called to the resemblance which some of the sculptured figures of antiquity bear to the *Equus przewalskii* above described.

The horse reappears in Neolithic remains in the Swiss lake-dwellings and elsewhere, but here apparently still as an object of the chase. The precise date of its domestication is uncertain. On Egyptian monuments no trace of it appears before the expulsion of the Hyksos or shepherd kings; and it is generally stated that the animal was previously unknown to the Egyptians, though it can hardly be considered as proved that it was introduced by the Hyksos.

In Scripture the horse is only referred to in connection with warfare; witness the poetic description of the war-horse in the Book of Job. The earliest mention of the animal in Holy Writ occurs in connection with the famine in Egypt, when Joseph gave the people corn in exchange for their horses; and its use for riding is alluded to in 2 Kings, xviii. 23.

In Homeric times the horse was not used for riding; indeed, at the battle of Marathon (490 B.C.) the Persians, but not the Greeks, used cavalry. After 450 B.C., however, the art was practised in Greece, and a treatise upon it, of somewhat later date, from the pen of Xenophon, still exists. The war-horses of the Britons and the chariots, their wheels armed with scythes, are described by Cæsar. Athelstan paid special attention to the breed of English horses, and even imported animals from Spain for its improvement. In this he was followed by other monarchs, as John and Edward III. In the reign of this latter king a law was passed forbidding the exportation of horses, and a

number of Spanish jennets were introduced. Henry VIII. made various enactments for improving the condition of the English horse, particularly relating to the pasturing of entire horses upon commons and open lands, where a good deal of promiscuous and detrimental breeding had taken place. In the reign of Elizabeth it was penal to make over a horse 'to the use of any Scottishman,' a prohibition naturally repealed by her successor, who further signalled himself by bringing over to England the 'Markham Arabian,' believed to have been the first of that breed introduced. He did not prove a success; but still the experiment was repeated from time to time, and in William III.'s reign the 'Byerly Turk,' the first of a celebrated trio, was brought over to England. At the very beginning of the 18th century came the 'Darley Arabian' (the sire of Flying Childers, 1715), and later the 'Godolphin Arabian,' or Barb (1724-53). The first of these was the great-grandfather of the celebrated racer 'Eclipse' (foaled 1764), from whom so many winners of important races have descended. Indeed, it is not too much to say that from one or other of these horses, in most cases from all three, all horses at present on the turf trace their descent in the male line. Since the commencement of the 19th century an accurate record has been kept of the descent of all racehorses, and an attempt has been made to carry the history about a century further back.

There has been much discussion and speculation as to the kind of animal from which the domestic horse has been derived. Colonel Hamilton Smith supposed that the modern breeds have descended from about five primitive differently-coloured stocks, but this view finds no supporters nowadays; rather is it maintained that 'the similarity in the most distinct breeds in their general range of colour, in their dappling, and in the occasional appearance, especially in duns, of leg stripes and of double and triple shoulder-stripes, taken together, indicate the probability of the descent of all the existing races from a single, dun-coloured, more or less striped primitive stock, to which our horses still occasionally revert.'

Whether the actual species thus alluded to is still living in the wild state is extremely uncertain; indeed it is held by many competent judges that no primitively wild horses now exist, the herds of horses that roam over the Russian steppes being supposed to be the descendants of animals which were once domesticated, and have relapsed into the feral state, as is known to be the case with the mustangs of South America.

The Tarpan, or wild horse of southern Russia, is a small animal, with thin, but strong, long-jointed legs, longish thin neck, and comparatively thick head, pointed ears directed forwards, and small vicious eyes. The coat in summer is close, short, and wavy, especially behind; in winter it is thick and long, forming a kind of beard under the chin; the mane thick and bushy, the tail of moderate length; the colour generally pale brown or yellowish in summer, almost white in winter. It is found in southern Russia, but (according to Radde) is absent from Central Asia, even from the north of the Gobi, where the dziggetai is found. It lives in large herds, often numbering several hundreds, subdivided into little groups or families, each presided over by a stallion, who protects his retinue valiantly, but permits no irregularities in their behaviour; young horses keep at a distance on the outskirts of the herd until they are able to undertake the cares of a family for themselves. The stallions are ever on the alert with nose and ear to detect the approach of danger, of which they give notice by a loud neigh, upon hearing which the whole herd takes to flight, sometimes disappearing

as if by magic from the crafty manner in which they take advantage of irregularities in the ground. The story that they protect themselves by forming a ring with heads directed inwards has no foundation in fact, although the stallions will defend the mares and foals from impending attack. The stallions fight vigorously among themselves with teeth and hoofs, and each as he attains maturity must win his position in the herd by a series of duels. They present all the appearance of truly wild animals, and are regarded as such by the Tatars and Cossacks, who destroy them on all possible opportunities, because they are useless for taming purposes, and because they inflict considerable damage upon these horse-rearing communities by devouring their stores of hay and enticing away their mares.

The South American wild horses, known as 'cimarrones' or 'mustangs,' are reported by Azara to be the descendants of some half-dozen individuals which were left to their own resources when the town of Buenos Aires was abandoned about 1535. When in 1580 the town was reinstated, they were found to have increased to a very considerable number. They are of the same size as the domestic horses, but with thicker heads and legs, and longer necks and ears; all are brownish or blackish in colour. Their social system is the same as that of the tarpans. They proceed in Indian file, leaving no gaps in the series, and are avoided by travellers owing to their attempts to entice tame horses into their company, not unfrequently with success. The Indians on the pampas eat the mares and foals, and also capture a certain number in order to tame them; but the Europeans make no use of them, except perhaps to kill one when fuel is scarce in order to replenish the camp-fire with its marrow. The accounts given by travellers of these animals differ in many important particulars.

The subject of the horse's paces is one which has given rise to much controversy. It has been maintained that horses in a wild state use only the walk and gallop, the trot and others being the results of education. This question can hardly be regarded as settled even now, for the fact that quite young foals have been observed to trot beside their dams is explicable as an instance of heredity.

Six well-marked paces may be distinguished in the movements of domesticated horses—the walk, the amble, the rack or pace, the trot, the canter, and the gallop. The study of the precise movements of the different limbs in carrying out these paces is very difficult, especially in the case of those in which the motion is rapid. Marey, the French physiologist, was the first to attempt a rigorous analysis of these movements by means of apparatus. He attached to the horses' hoofs small elastic bags, connected by tubes with pointers, which made marks upon a revolving cylinder. When any one of the feet touched the ground the bag was compressed, and the pointer instantly made a corresponding mark upon the cylinder. Very valuable results were obtained by this method of study; but they need not be further detailed here, as they have been superseded by the beautiful photographic investigations of Muybridge. In these experiments the horse was made to proceed along a track in front of a row of twelve or twenty-four cameras, so arranged that, as the animal passed in succession before each of them, an instantaneous photograph of it was obtained. These pictures furnish the means of analysing the various paces, as the exact attitude of the horse is shown at very short intervals of time. In the case of an ordinary walk the horse has always two and sometimes three feet on the ground at once. The order of the succession of the footfalls is as follows: left hind, left fore, right hind, right fore; furthermore the horse is

alternately supported by the two feet of the same side (laterals) and by a hind and a fore foot of different sides (diagonals); when the animal rests upon the laterals, the suspended feet appear in a side view between the supporting feet; when upon the diagonals, the suspended feet hang out one in front of and the other behind the supporting feet. These rules furnish the means of testing the accuracy of artistic representations of walking horses. The amble is a rapid walk, the length of time the feet rest upon the ground being reduced so that the body is often supported upon only one foot, and generally only on two. In the 'rack,' the fore-feet move as in a slow gallop, the hind-feet as in a trot. In the (American) 'pace,' the legs of the same side are lifted together—an action which has aptly been compared to two men running one behind the other and keeping step. The trot has been defined as a pace characterised by the synchronous movement of the diagonal limbs, though in practice the movement is rarely, if ever, quite simultaneous. It has often been maintained by experienced horsemen that a horse in trotting has always at least one foot in contact with the ground. So far, however, is this from being the case that a fast trotter is quite unsupported for more than half the distance he traverses in each stride. In the canter the order of the footfalls is the same as in the case of the walk, and the characteristic difference is due to the peculiar rhythm as well as to the final effort which propels the body at the conclusion of the stride as the fore-leg leaves the ground.

We may analyse the gallop by the aid of the accompanying reduced silhouettes copied from Muybridge, and then it will be seen that its conventional representation by artists is quite unlike any of the actual positions assumed by the moving animal. Fig. 1, it must be remembered, does not represent the start of the gallop, but merely a phase in a continuous action; the body is moving forward by impetus already acquired, and the fore-foot just leaving the ground is adding to it. Fig. 2 is twenty-seven inches further forward; the leg which was on the ground in the last became so slant that it was obliged to quit the ground, and is now thrown backward; the hind-legs are gathering up and coming forwards preparatory to descending. Fig. 3 shows no further propulsion, but the hind-legs are still moving forwards. In fig. 4 one hind-leg has just touched the ground, the other is at its greatest extension; one fore-leg has come forward about half-way. In fig. 5 both fore-legs are being extended in advance; one hind-leg is pushing upon the ground, the other being brought down. Fig. 6 shows both hind-legs at work propelling the body forwards and upwards; one leg has nearly done its work, the other just begun; one fore-leg is at its maximum forward range, the other is being projected. In fig. 7 one hind-leg has left and the other is just leaving the ground; one fore-leg has reached the ground and is just beginning its stroke. Fig. 8 shows both hind-legs in the air, and the weight of the body supported upon one fore-leg. In fig. 9 one fore-leg is doing its stroke, the other is nearly ready to begin; the hind-legs remain much as in the last diagram. In fig. 10 one fore-leg has left the ground, the other is at work upon it; and the hind-legs are being brought forwards. This brings us to the end of the series, for fig. 11 is really intermediate between figs. 1 and 2. One or two facts may be seen from these diagrams, which, though small, are accurate. The greatest propulsive force resides in the hind-legs; as the weight of the horse descends upon any one of its feet, the strain upon the limbs is so great that the pastern joint lies quite horizontally; the

legs are bent when taken up and straightened in the descent; the heels strike the ground before the toes. The length of a stride in the different paces may be approximately stated as follows: walk, 6 feet; amble, 10 feet; rack, 12 feet; trot, 8 to 18 feet; canter, 10 feet; gallop, 12 to 20 feet. In the matter of speed a horse may be said to walk 4 or 5 miles an hour, trot under saddle 6 to 12 miles, or in harness 10 to 12 or even 14; as regards a gallop, the fastest records seem to be 3 miles in 5 min. 42½ sec.; 1 mile in 1 min. 43 sec. It is stated that some of the old Cleveland horses could carry 760 lb. for 60 miles in twenty-four hours, and Lawrence gives a story of a Galloway which beat the coach from London to Exeter (172 miles) by a

quarter of an hour, notwithstanding its frequent relays of fresh horses.

A few words must be devoted to the various domestic breeds of horses.

The *racer* is the one for which England is pre-eminently famous, and his origin from the combination of oriental with native blood has been above alluded to. The age of the racehorse when ever foaled is reckoned from the next 1st January, and hence it is advantageous that they should be born early in the year, so as to gain as much time as possible for development. In July or August of the following year the serious training for the two-year and three-year-old races now in vogue begins. Very few horses now race after four years

The Horse in motion (after Muybridge).

old, but are used for stud purposes, at prices varying with the success they have attained on the turf.

Successful racehorses vary much in shape, some being small and neat, others tall and bony. In height they may be said to range from 15 to 16½ hands (the hand = 4 inches), though the most usual dimensions are between 15½ and 16 hands; the head should be light and well set on the neck, the ears small and pricked, the eye large, and the nostrils wide and expandable. The neck must be moderately long, and must combine muscular development with lightness; the windpipe broad and loose; the withers may be high and narrow; but it is imperative that the shoulder be sloping and muscular. The body should be moderately deep and straight; length should be given to it by the shoulders and hips; the loins must be broad and firm; the hips long and wide. The limbs ought to be well proportioned and cleanly modelled; the fetlock-joints large and the pasterns strong; the feet of moderate size, with no sign of contraction either in the heels or the frogs. The tail should be set on high. Most important of all is it that the different parts should harmonise together, and that the action should be good. Colour is perhaps of less consequence; still it is worthy of remark that for a long time the majority of winners have been chestnuts.

At his fastest speed a racehorse may cover a mile in 1 min. 43 sec.; the rate of a mile a minute currently attributed to Eclipse is, according to a competent authority, 'wildly incredible.'

In America the favourite form of horserace is the trotting-match, which appears to have originated in the prohibition of horseracing by the Puritans.

The gradual evolution of the fast trotter is remarkable. In 1828 a bet of \$2000 was made and lost that no horse could trot one mile in 3 minutes. In 1852 the time required for that distance was 2 min. 26 sec.; in 1866, 2 min. 18 sec.; whilst in 1881 it had been brought as low as 2 min. 10½ sec. In 1843 there was one horse that could do the mile in 2½ min., whilst, in 1871, 233 horses, and in 1882 no less than 1684 could accomplish this feat. See TROTTER.

The *hunter* is sometimes, but not often, a thoroughbred. If this be the case, he is generally a horse that has failed to stand the test of the short rapid races, and is thereafter trained for a hunter. He differs from the racer mainly in carrying-power and endurance. A deep girth, with broad hips, a back not over long, and strong legs are his most essential characters. Jumping is a most necessary accomplishment. A five-barred gate is the ordinary limit of a leap; but a few horses have been known to clear heights well over 7 feet. Yet only a few will jump 10 or 12 feet of water in the hunting-field, although horses have been known to leap a distance of 36 feet.

The *charger* ought to be 15½ hands high. He should be a good weight-carrier, and the paces should be easy, owing to the regulation length of the military stirrups. Furthermore, as the soldier has to devote his right hand to the management of his weapon, only the left can be used for guiding his steed, which has thus to be accustomed to take its instructions from the pressure of the leg or indications given by the heel.

Harness-horses are of all degrees of value, and of varieties of race and breed, from the tall high-stepping bays, 16½ or even 17 hands in height, which

draw the four-in-hands of the wealthy, to the little pony which drags a basket phaeton. A really well-matched pair of carriage-horses of good action will fetch a very high price. For horses drawing light vehicles, 15.1 hands is an average height; those preferred for coaching are taller, and the wheelers are commonly an inch higher than the leaders.

Cart-horses, like other harness-horses, are of all kinds. The enormously heavy animals which have been developed as the result of crossing the native blood with Flemish are now to be seen almost exclusively in the drays of brewers; for the most part they are bred in Lincolnshire, and are expensive to rear, and hence to purchase. The old Cleveland breed and the Suffolk Punch are said to be now extinct, and the Clydesdale is perhaps the favourite breed for this purpose at the present time.

A pony is defined as being a horse under 13 hands high; the Exmoor ponies are a valuable breed, with well-shaped head, good quarters, and powerful hocks. For small dimensions the palm is, however, carried off by the Shetland breed, the height of which is often as little as 10 hands, and not unfrequently less even than this.

In the manner of stable management it is of first-class importance that the stable itself should be in a healthy locality, and free from even the suspicion of bad smell or foul air, to both of which horses are particularly sensitive. The stalls should be roomy, and the slope of the floor no more than is needful to allow the drainage to run off; indeed an arched floor is to be preferred to a smooth slope. The stalls should be adequately lighted, but the eyes should not be strained by the use of too light paint or whitewash on the walls. Good ventilation is imperative, and should be achieved without exposing the animal to cold draughts. About 55° F. is the mean temperature to be aimed at, but it is very often impossible to keep it down nearly so low as this; in winter it is easy to keep it up, or even if this fail, the difference can be made up by clothing. In all matters pertaining to the treatment of a horse, regularity and moderation are the great secrets of success.

The food varies much with the nature of the work the horse is called upon to perform, and the means of his owner. A cavalry charger is allowed 10 lb. oats and 12 lb. hay per diem; an omnibus horse 17 lb. of mixed oats and maize, the proportions varying according to the relative prices of the two grains, and 10 lb. hay. A hunter is very commonly allowed 12 lb. oats, 2 lb. beans, and 6-8 lb. hay.

A certain moderate amount of exercise every day is necessary; nothing is worse than excessive fatigue one day and entire rest another. Two hours walking will as a rule suffice, but the needs and capabilities of different animals must be studied by those who have the care of them; in all cases it should be enough to prevent undue fidgetiness when the animal is used by his master.

HORSE-BREAKING, a process through which all young horses have to go before they are fit for work. The racehorse is generally broken when about eighteen months old, but carriage and draught horses are not broken until four-year-olds, though many farmers break their horses for light work at an earlier age. The process differs considerably in various countries, but that in use in England, though the slowest, is the most thorough, and the only one fitted to break a really valuable horse without risk. The chief requisites for a good horse-breaker are gentleness and unlimited patience, as a hasty action may undo days of work. Before the commencement of the training, the horse is accustomed to be touched by a man, and to the feel of a halter. After he is familiar with his

breaker, who should on no account be changed, he is taken out with leading rein and halter until used to being led. The breaker may then commence to 'mouth' his charge—i.e. teach him to answer the pressure of the bit. This is generally done by placing a bit in the horse's mouth every day while in the stable, until he is used to the metal; he is then driven with long reins attached to his bit, by the breaker, who walks behind and turns his pupil in various directions until he answers the rein readily. After the mouthing has been thoroughly done, the horse may be mounted or harnessed and gradually accustomed to his proper work. As the majority of horses do not repay so much trouble, they have to be broken more quickly, but in the case of a high-bred animal at the risk of his courage or his temper.

In 1858-60 great attention was called to the system of an American called J. S. Rarey, who broke horses thoroughly in an hour. The essence of Rarey's method (a method published many years previously, but first introduced to the public by Rarey) was the 'casting' or throwing down of the horse, and frightening him so thoroughly that he gave no further resistance. Twenty years later much discussion was raised over an Australian system, said to differ entirely from Rarey's, but differing only in the fact that the horse's head was tied to his tail until he fell, instead of violently casting him. Both of these systems, while of great utility in the case of a vicious horse, or where horses are plentiful and of little value, are much too severe to be undergone by a high-couraged but nervous colt, who only requires patience and gentleness to master him.

From 1784 a tax was imposed upon horses and horse-dealers; in 1869 this was fixed at 10s. 6d. on each horse or mule, and £12, 10s. was charged for a dealer's license; the tax was removed in 1874.

There are works on the horse by Sidney (new ed. 1887), Walsh [*'Stonehenge'*] (new ed. 1899), Youatt (new ed. 1882), Cuyler and Alix (Paris, 1886), Hayes (1893; new ed. 1904), Sidney (new ed. 1893), Tegetmeier (1894), and Tweedie (1894); on horse-management, by Mayhew (1900) and others; on the anatomy of the horse, by M'Fadyean (1884) and Flower (1892); on horse-breaking, by Moreton (1883) and Hayes (1889). See also the articles RIDING and DRIVING, HIPPOPHAGY, VETERINARY MEDICINE, GLANDERS, UNSOUNDNESS, &c.; Huth's bibliography (1887); Ridgeway, *Origin and Influence of the Thoroughbred Horse* (1905); Lydekker, *The Horse* (1912).

Horse, MASTER OF THE, or MAGISTER EQUITUM, in ancient Rome was a magistrate appointed along with a dictator. Commonly he was chosen by the dictator, to whom he was subordinate, and whom he represented in his absence. Originally the Magister Equitum was commander of the cavalry, as the dictator was of the infantry.

Horse, MASTER OF THE, the third great officer of the court, who has the superintendence of the royal stables, and of all horses and breeds of horses belonging to the King. He exercises authority over all the equeries and pages, grooms, coachmen, saddlers, and farriers, and has the appointment and control of all artificers working for the royal stables. He is answerable for the disbursement of all revenues appropriated to defray the expenses of his department; but his accounts are audited and examined by the Board of Green Cloth. He has the privilege of making use of the royal horses, pages, and servants, and rides next to the monarch on all state occasions. The office is one of great antiquity, and is considered a position of great honour. He is appointed during pleasure, by letters-patent; but his tenure of office depends

on the existence of the political party in power. The salary is £2500 a year. Mr Ramsay MacDonald (1924) and Mr Baldwin (1924) left the appointment to the king, as non-political.

Horse-chestnut. See CHESTNUT.

Horse-flesh. See HIPPOPHAGY.

Horse-fly. See FOREST-FLY.

Horseguards. See GUARDS. The name is also applied to a large public office in Whitehall, appropriated to the departments under the general commanding-in-chief. The word Horseguards is used conventionally to signify the military authorities at the head of army affairs, in contradistinction to the civil chief, the Secretary of State for War.

Horse-hair. See HAIR.

Horse-hair Worm. See HAIR-EEL.

Horseless Carriages. See TRACTION-ENGINES, INTERNAL-COMBUSTION ENGINE, MOTOR-CARS.

Horsens, a Danish seaport on the Horsensfiord, 32 miles SSW. of Aarhus; pop. 27,600.

Horse-power. The word *power* is of frequent use as a scientific expression. Thus we speak of steam-power, water-power, and so on. When used in this sense it is quite obvious that reference is merely made to the nature of the store of energy in the particular motor under consideration. Again, when we speak of the total energy of a given system as the total power that it has of doing work, it would seem to be almost an insult to the mental power of our auditor to tell him in addition that by the latter phrase we mean simply total work measured in terms of any convenient unit. But it is often necessary to know the quantity of work which can be produced in a given time by a given motor. It is in this connection that the term one *horse-power* is used to denote the rate at which on the average a horse can do work per unit time, and this rate is adopted in Britain as the unit rate of working. Estimates of its numerical value necessarily differ very much; and so, in order to get a definite unit available for scientific purposes, the convention is made that the original estimate of Boulton and Watt shall be regarded as correct. The value which they gave was 33,000 foot-pounds per minute.

An ordinary rule for calculating the horse-power of a steam-engine is to divide by 33,000 the continued product of the area of the piston in inches, the pressure in pounds weight per square inch, the length of the stroke in feet, and the number of strokes per minute. Thus, by the horse-power of an engine we merely mean the numerical rate at which it can do work, expressed in terms of the above conventional unit, and this number obviously coincides with the number of horses to which the engine is equivalent as regards work in the same time. Of course the available horse-power is less than the actual horse-power as got by the above rule, because of the work, which has to be done against friction in the engine itself. See STEAM-ENGINE. The term *man-power* is similarly used, being usually taken as one-eighth of a horse.

Horseracing. Horses were used for harness purposes before they were ever ridden; and chariot-races took place before horses raced under saddle. The earliest mention of chariot-races occurs in Homer (*Iliad*, xxiii.), who gives a clear description of those contests. The programme of the Grecian games included horseracing in the 33d Olympiad—i.e. the year 648 B.C.; some authorities give the time as the 23d Olympiad, though this earlier date was that of chariot-racing. Racing can thus claim

a history, albeit a broken one, of nearly 3000 years, and, at the period above mentioned, it was so far reduced to a system that the horses had to be entered and sent to Elis at least thirty days before the contests began, the riders spending the month in a course of training and exercise. The 71st Olympiad, or 496 B.C., the Greeks instituted a race called the 'Calpe,' which was confined to mares, just as the One Thousand Guineas and the Oaks are now; while according to Grote's *History of Greece* it would appear that, in course of time, a certain number of races were restricted to colts of one age, so that they might not labour under the disadvantage of competing under equal weights against older horses. In the 10th century, Hugo Capet accompanied his request for the hand of King Athelstan's sister by a present of several German running horses. In the reign of Henry II. 'hackneys and charging steeds' raced at Smithfield; and under Richard I. we hear of a course three miles long, with a prize of 'forty pounds of redy golde' for the winner. To James I. the credit is commonly assigned of having placed the turf on a permanent basis. His taste for racing appears to have been fostered by an accidental circumstance. It is said that several Spanish horses, thrown overboard from the ships of the Armada, reached the coast of Galloway, and proved superior in speed to any of the native horses. The suitability of Newmarket as a site for racing had been perceived prior to the advent of James I., who, however, lost no time in witnessing the races there, as he was present in 1605, probably for the first time, that being two years after his accession to the throne. It is worth mentioning that the king was at Lincoln races in 1607, because, on the occasion of a race taking place there on the 3d April, the king appears to have acted as a sort of clerk of the course, for he caused the track, a quarter of a mile long, to be 'raled and corded with rope and hoops' on both sides, whereby the people were kept out, and 'the horses that ronned were seen faire' (Nichols' *Progress of James I.*). Cromwell was, to a certain extent, an upholder of racing, though perhaps he did more for breeding than for racing; but Charles II. greatly encouraged the turf, and caused races to be held near whatever place he might happen to be staying. Queen Anne, as is well known, kept racehorses, ran them in her own name, and gave plates to be run for. None of the first three Georges signalled themselves by extreme love for the turf; but it was in the twenty-third year of George III. that the Horse Tax, which *inter alia* imposed a duty of two guineas upon every horse entered or starting for any plate, &c., was passed. Before George III.'s long reign came to an end the Prince of Wales was a prominent figure in the racing world, his career as a horse-owner dating from 1784. In 1786 the stud was sold in consequence of the pecuniary embarrassments of the prince; but, on parliament generously increasing his income, he took to racing once more. When the prince next gave up racing it was for a very different reason. His horse *Escape* was entered to run on the 20th and 21st at the Newmarket October meeting in 1791. On the first day it was beaten by three others; but on the second day it won easily, whereupon unpleasant remarks were made, the Jockey Club took the matter up, and Sir Charles Bunbury told the prince that if he continued to allow Chifney to ride his horses no gentleman would start against him. Rather than sacrifice his jockey he retired from the turf, though he made a modified reappearance in 1805 at the request of the Jockey Club; but the royal stable was never represented at Newmarket after 1808. William IV. naturally had no taste for racing, but as a sort of duty he

kept on so that the nominations should not become void.

Queen Victoria took little interest in racing, though she maintained the royal stud at Hampton Court, where, during her lifetime, many good horses were bred. And the stud was never better than when it was decided to close it in 1893, for La Fleche, who won the One Thousand, Oaks, and St Leger in 1892, and afterwards won important handicaps under very heavy weights, and Sainfoin, winner of the Derby in 1890, had been recently bred there. King Edward, on the other hand, was a staunch supporter of the turf, both before and after he came to the throne. He ran steeplechase horses first, but after a time turned his attention to flat-racing, and during one period of his turf career was remarkably successful. He established a breeding stud at Sandringham, and was rewarded by winning the Derby twice with horses of his own breeding. The two horses which bore the royal colours successfully at Epsom were Persimmon and Diamond Jubilee, own brothers by St Simon from Perdita II. by Hampton, Persimmon being foaled in 1893, and Diamond Jubilee four years later. Both of these horses were great performers, Persimmon being probably the better of the two; he also won the St Leger, the Ascot Gold Cup, the Jockey Club Stakes, and the Eclipse Stakes, and several races of less importance, but he did not run in the Two Thousand of his year. Diamond Jubilee won the Two Thousand and St Leger as well as the Derby, and was sold to an Argentine buyer for £30,000. And Florizel II., also by St Simon from Perdita II., was a good winner for the then Prince of Wales, taking among many prizes the Manchester Cup, the Gold Vase at Ascot, and the Goodwood Cup. These three brothers were the best horses which bore the royal colours during the successful period; but in 1909 King Edward won his third Derby with Minoru, who was not bred at Sandringham, but was loaned for his racing career from Colonel Hall Walker (afterwards Lord Wavertree). King Edward also won the One Thousand Guineas with Thais in 1896, but was never successful in the Oaks. In 1900, however, he won the Grand National steeplechase at Liverpool with Ambush II. King George V. carried on the stud after he came to the throne, but, so far, has not met with any great measure of success. His horses are trained by Richard Marsh at Newmarket, and have won a fair number of minor races, but no event of the first importance.

The conditions which surround racing have become so greatly changed during the last two generations that historical matter must be briefly dismissed. Broadly speaking, racing has been carried on in this country for nearly 400 years, and doubtless there was plenty of it at an earlier period, though definite details are wanting. One William Stephanides, writing of the time of Henry II., said that horseracing was a Sunday amusement for Londoners. The writer was a monk of Canterbury, and the period the 12th century, but there is nothing to show whether the races were in any way organised. Three hundred years later, when Henry VII. came to the throne, he found the supply of horses so small, and the prices so high, that he forbade the export of any horse without royal permission. Henry VIII. continued the protection policy, and made horse-stealing a capital offence; in his reign horses were used for agriculture, and to draw the state chariots of noblemen, an interesting account of which chariots was discovered by the late Sir Walter Gilbey. This dealt with the stables of the fifth Earl of Northumberland in 1512, and also described the horses which were used at that day. It was in the reign of James I., however, that the real foundations of

the turf were laid, for that monarch imported, or caused to be imported, many Eastern stallions to cross with the native stock, which, as can be judged from old writings, had been greatly improved since the restrictions with regard to export and so forth had been imposed. According to Gervase Markham, who wrote a book on horses in 1616 or the following year, he (the author) brought to this country a horse known as the Markham Arabian, which he sold to King James for £154 on 20th December 1618. The import of Eastern sires continued for more than a hundred years, no fewer than 174 being mentioned in the first volume of *The General Stud-book*. Yet in line of tail male only three survive—viz. the Darley Arabian, the Godolphin Barb—as he is usually called—and the Byerly Turk. It follows, then, that every racehorse in the kingdom goes back on the top side of his pedigree to one of these three, and has, as a matter of course, great numbers of lines of each of the three through lower quarterings in the pedigree. And as thoroughbreds all over the world are descended from English racehorses, the same breeding is to be found in them, whether they are European, American, or Colonial. The line of the Darley Arabian is much the strongest of the three, its winnings in stake-money every year in this country being, broadly, about five times as big as the winnings of the other two put together. Captain Cuttle, who won the Derby in 1922, is, by the way, in direct line from the Godolphin Barb, or Arabian. On the female side the thoroughbred is originally descended from what were called 'Royal mares,' and from mares by Eastern stallions from native British mares, and it is more than probable that where the pedigree of any horse ends in a blank, native origin is implied, for there is not a particle of evidence to show that any pedigrees of horses were drawn out unless there was Eastern blood in the particular horse involved. On the other hand, the pedigrees of all the Eastern horses were carefully kept. The Royal mares, as is generally understood, were imported by Charles II., who sent his Master of the Horse to the East to procure breeding stock. Whether they were Arabs, Barbs, or Turks is not known, but they undoubtedly improved the breed in this country. It is, however, difficult to decide whether the term Royal was not applied to all the mares in the king's stud, native as well as imported, and unfortunately no list of the imported mares has ever been found; and though there is some evidence to the effect that the mares were Barbs rather than Arabians, even this is not conclusive. What is established is that a distinct breed of horses came into existence between 200 and 300 years ago, which were bred primarily for racing, and of which the pedigrees were carefully compiled from year to year, so that each generation was able to show a stronger list of Eastern ancestors than its predecessor. It must also not be lost sight of that the British climate seems to have suited these Eastern horses, and also that their being crossed with the native British blood has resulted in a breed being established which is not only the fastest in the world, but is so prolific of good qualities that it has marvellously improved all other breeds which have been crossed with it. The climates of England and Ireland, Wales, and the lowland parts of Scotland are emphatically suitable for horse-breeding; and it is worthy of note that, broadly speaking, the height of thoroughbreds has increased something not far short of two hands (eight inches) in about 200 years. The Eastern horses which were imported were seldom more than one inch or two over fourteen hands, and the Arab horse in his native country is at the present day of much the same size. But the British thoroughbred is now more fre-

quently over than under sixteen hands, while many of the very best horses of modern times have been half a hand higher. Indeed, horses of seventeen hands are fairly common among thoroughbreds; and a horse named Ambergis, who ran in 1875 and 1876, actually measured eighteen hands. This was, of course, an abnormal exception to the general size, but the growth has been continuous and steady through a long period of years, and now the rather small thoroughbred is at a discount, because he is, as a rule, without the length of stride of the bigger horse. To sum up this part of the subject, racing has improved the breed of thoroughbreds almost from year to year, and has also improved all the breeds of light horses, not only in this country, but in Europe generally, and in many other parts of the world.

Without racing there would have been no test of merit, and the best-looking horses would have borne away the palm as the best horses of the breed. As a matter of fact the best runners are generally good-looking, but the one supreme test is speed, and it is the horses which do best in their running days that maintain the excellence of the breed when put to the stud. Occasionally a finely bred horse who has not been trained, or who has only been a second-class racer, becomes a successful sire of racers; but such instances are few and far between, whereas great numbers of attempts to make a successful sire out of a second or third class performer have ended in failure. And as time goes on, and owing in a great measure to the wonderful but gradual improvement in thoroughbreds, due almost entirely to the care which has been taken with regard to their breeding, the turf has become a great national institution, on which hundreds of thousands of pounds are spent annually, and which affords an occupation and means of living to great numbers of men, and recreation to countless thousands in almost every part of the kingdom. And as the horses have improved, so, too, have the race meetings. Chester is said to be the oldest racecourse in the kingdom, racing having taken place there in the reign of Henry VIII.; while there was a racecourse at 'Wheatley Moor,' Doncaster, in 1600, and as Wheatley Park is close by the Town Moor, where the St Leger and other races are decided, it is probable that the course now in use is the same as that of the end of the 16th century. A horse won the silver bell at Sapley, near Huntingdon, in 1602, and this horse was owned by one Oliver Cromwell, who is thought to have been an uncle (or some near relation) of the famous Protector. Racing at Richmond in Yorkshire and at Carlisle took place more than 300 years ago, the Carlisle Corporation having given silver bells to be run for in 1599; and there is a mention of a horse-race at Haddington as long ago as 1552, where the prize was the usual silver bell. The racecourse at Newmarket dates from the reign of James I., and in 1611 there was 'Great Horse Racing' at Croydon, and six years later £50 was given for a race at Woodham Moor in the county of Durham, which races were visited by King James I. at Easter of that year when the king was staying at the Castle of Durham. In Clarkson's *History of Richmond* (Yorks) there is a description of the race for the cup on 16th May 1622, and this is the earliest description of a race the writer has been able to find. The race was won by a horse owned by Sir George Bowes. There is record of races at Salisbury in 1616, and at Langworthy (Langwathby?) in Cumberland in 1612, and in 1617 of races at Whalley Abbey, Liverpool, and Walton, at Thetford in Norfolk, in 1620, and at Linton, Cambridgeshire, in the reign of James I., but the exact date is missing, at Brackley, Northants, in 1612, while there is evidence that York, Paisley, and Peebles had

racing about the same time. Although the Newmarket racecourse is said to have been laid out in the reign of James I., there is no record of racing having taken place there before 1640, though there is some evidence of a race having been run on 19th March 1619. At all events Newmarket flourished as a racing centre after the Restoration, and gradually became the headquarters of the turf, and has so continued until the present day. In 1740 an act to restrain excessive racing was passed by Parliament, and this was due to the fact that scores of little meetings had sprung up all over the country, with very small stakes to be run for. The new act provided that horses entered for races must be *bond fide* the property of the person who entered them, and that no plate should be run of less value than £50. Parliament also settled the weights to be carried—viz. 10 stone for five, 11 stone for six, and 12 stone for seven year olds. It will be seen that no horses younger than five-year-olds were eligible; but doubtless the act did not give entire satisfaction, for a few years later—in 1750, or 1751—the Jockey Club was brought into existence, and though for some time it was only concerned with Newmarket, it gradually took charge of the sport altogether, and for many years it has been the supreme head of racing. In 1789 there were race meetings at seventy-two places in England, at three places in Wales, at six in Scotland, and at fifteen in Ireland. At many of these places, however, there were many meetings. Newmarket had ten, Malton (in Yorkshire) four, and other places two. Cathedral cities and county towns made a bold show in the lists with meetings at Chester, Carlisle, Durham, Hereford, Canterbury, Peterborough, Lincoln, Wells, Lichfield, Oxford, Salisbury, Worcester, Winchester, and York. Of these cathedral towns, in Durham, Hereford, Canterbury, Peterborough, Wells, Lichfield, Oxford, and Winchester racing ceased in the last quarter of the 19th century, but the sport survives at the other places in the list. The chief reason for the disappearance of the cathedral city and county town meetings was a rule made by the Jockey Club in the eighties of last century, that no stake of less than £100 to the winner should be run for under their rules. This caused the immediate disappearance of a host of minor meetings from the fixture list; and though a few struggled on for a few years, the advent of the park meetings, where gate-money could be charged, was the final blow, for all the old meetings were open to the public, except in such stands and enclosures as had been arranged, which were always grouped on one side of the winning-post.

It will be seen from the reference to a certain act of Parliament which restricted the number of meetings and fixed the weights which horses had to carry, that at the time (1740) there was no mention of very young horses taking part in racing, and Orton's *Turf Annals*, which deals with York and Doncaster races from 1709, first mentions four-year-olds in 1743, when a plate of £50 was run for at York on 12th August of that year. Our ancestors believed in fully matured horses, big weights, and long courses, four-mile heats being the custom, practically, all through the 18th century, or in some cases four miles in a single race. The four-year-old event referred to was run in two-mile heats. Three-year-old racing followed very quickly, the stand plate of £50 for three-year-olds being run for at York in 1770, and from that date onwards there was at least one race for three-year-olds at every meeting.

The St Leger at Doncaster for three-year-olds was first run in 1776, while three years later the first race for the Oaks took place. The first Derby was run in 1779, the first Two Thousand Guineas

in 1809, and the first One Thousand Guineas in 1814. These five races are the so-called 'classic' races, and all are for three-year-olds, the Oaks and the One Thousand being for fillies only. No horse, or rather filly, has won all the five; but in 1902 Sceptre took the Two Thousand, One Thousand, Oaks, and St Leger, but was beaten in the Derby. Up to the present time the Derby proper has been won by five fillies only; but in 1916, one of the War years, a filly, by name Fifinella, won the substitute Derby, which was decided at Newmarket. Though there have been more valuable prizes than the classic races since the establishment of the Eclipse Stakes at Sandown Park in 1886, their prestige is still greater than that incurred by the winning of other and more valuable stakes, and the Derby winner enjoys a reputation for all time, which is enhanced if he wins the St Leger, the Ascot, Doncaster, or Goodwood Cup, and still more enhanced if he proves to be a successful sire when sent to the stud. Because of the Derby and Oaks being included in its programme the Epsom Summer meeting is still the greatest racing fixture of the year; but its course is a poor one in many respects, and the running track itself being on open common land is with great difficulty kept in decent condition. There was racing at Epsom some 200 years ago, and both Epsom and Ascot were fashionable almost throughout the 18th century, but after the institution of the Derby and Oaks Epsom made rapid and continuous advances in the public favour, while Ascot hardly came into its own so soon, but has been a great meeting from the end of the 18th century at least, and for nearly the whole of that period the Ascot Cup has been the greatest race of the year apart from the classic events. This Ascot Cup, commonly called the Gold Cup, was first run in 1807, and its distance is two miles and a half. Three-year-olds and older horses are allowed to run, and in four years out of five the race is won by the champion stayer of the day. The course is laid on crown property, and, like the Epsom course, it is not very easily kept right, but it has been greatly improved in recent years, and a great point was made when it was decided to keep the public off the course between the races—except at one or two places where there is a crossing. The programme is the strongest of that issued by any meeting, the prizes, broadly speaking, amounting to nearly £10,000 for each of the four days of the meeting. Long-distance racing is greatly encouraged, and weights-for-age races of every distance from five furlongs to nearly three miles, and these attract all the best horses in the kingdom, all owners being anxious to win at Ascot, where the winning of races confers considerable prestige on the horses which are successful. Two other great meetings are Goodwood and Doncaster, and here also stayers are well catered for, with the Goodwood Plate and Cup at the first-named, and the St Leger, the Doncaster Cup, and the Great Yorkshire Handicap on the famous Town Moor. From the strictly racing point of view Newmarket is, however, the centre of the racing world. No fewer than eight meetings, comprising twenty-nine or thirty days' racing, are held at the headquarters of the turf, and over 1000 racehorses are trained there. Other training centres are scattered over the Down counties of Hants, Wilts, Berks, and Sussex, and some few hundreds of horses are trained at Malton and Middleham in Yorkshire, while a small number are prepared in Scotland.

There are in addition to those at Epsom, Ascot, Doncaster, Goodwood, and Newmarket a few old meetings still in the list of fixtures, and perhaps York and Chester are the most important of these. But while the Knavesmire, on which the York races are run, is still an open course—apart from

the stands and enclosures—Chester has become a gate-money meeting, and this applies to other country and provincial fixtures. Indeed, where it has been possible, all the open courses have been enclosed, and a toll levied on all who attend; while in some cases, Nottingham and Newcastle-on-Tyne, to name a couple, the old racecourse has been abandoned in favour of an enclosed course of the modern type. The first really enclosed course was Sandown Park, which was opened in 1875, and this course—which has had a long period of success—was the forerunner of a number of other racing centres, several of which are close together, the result being that racing has become greatly centralised. There are, for example, within fifteen miles of London four racing centres—Sandown, Kempton, Alexandra Park, and Hurst Park to wit—which have between them upwards of thirty days' flat-racing, and, except at Alexandra Park, a series of steeplechase meetings during the winter months. Then in Surrey, Gatwick and Lingfield are only a few miles apart, with Plumpton (a National Hunt racing-course), Brighton, and Lewes some five-and-twenty miles farther south. In the Midlands, Derby, Nottingham, Leicester, Wolverhampton (Dunstall Park), and Birmingham are another group of enclosed meetings; while in the north there are Stockton, Redcar, and Gosforth Park (Newcastle-on-Tyne). In Yorkshire the meetings are more scattered, with York and Doncaster as the most important, and supported by Catterick Bridge, Ripon, Pontefract, and Beverley. Lancashire has Manchester, Liverpool, and Haydock, with some ten meetings among them. Berkshire has Windsor and Newbury, some nine meetings in all; Hampshire has Salisbury, where also the Bibury Club meeting is held; Lincolnshire, Lincoln with two fairly important meetings; Warwick has three meetings annually, Yarmouth one, Carlisle one, Folkestone three, and Worcester two; while in Scotland several meetings are held at Ayr, and two apiece at Edinburgh and Lanark. Nearly all the meetings are now gate-money affairs, managed by companies or syndicates, and each of them has a club with its members' enclosure, one result of the system being that the number of ladies who attend the meetings increased perhaps tenfold in fifty years. Until the club enclosure came into fashion there were few meetings at which there was proper accommodation for ladies, Ascot being a notable exception. It was then the custom for those ladies who attended to go in carriages, which were drawn up on the far side of the course, and from which the view of the racing, except from the top of a coach, was exceedingly poor, owing to the crowds of pedestrians, who naturally enough secured all the best places. But for many years ladies have attended all the park (or club) meetings in great numbers, and at the present day scores of them run horses in their own colours, and it is not an unusual thing for half the races of a day's programme to be won by ladies. Indeed, a substitute Derby was won at Newmarket by Lady James Douglas's Gainsborough in 1918. Club racing has, in fact, changed the character of racing as far as its social side is concerned, and it has improved the sport from the running point of view, because it is possible to keep the courses in much better order than was usual under the old system. The old courses were frequently on common land, where there were grazing rights and so forth, and where, in consequence, it was difficult to have the running-tracks in anything like good condition. Now at all the enclosures a staff of men is kept, who look after the courses, and the running tracks are manured, mown, and rolled as is required, while they are also watered by powerful hydrants in times of drought, the upshot being that far less is heard

of horses breaking down while taking part in a race than was previously the case.

Another great change which has come over racing in modern times is that whereas our ancestors only raced matured horses over long distances, we now run great numbers of two and three year olds, and comparatively few horses of four years old and upwards, and, as a natural sequel, modern races are for the most part run over much shorter distances than those of a hundred years ago. Whether the present plan is the best is open to argument, and cannot be discussed in a short article; but it is worthy of note that on the French turf, which began with English-bred horses, and has always been modelled on the racing of this country, they have many more long-distance races than we have, and their two-year-olds are not allowed to compete until nearly two-thirds of the season has been passed. The fashion of the day in British racing demands a quick return for the money spent, and the thoroughbreds are put into training almost as soon as they are able to carry a saddle, and actually begin to race when just about two years old. Their first attempts in March, April, and May are confined to five furlongs, but in June they can race over six furlongs, and during the last three months of the season there are many mile races for two-year-olds. And the old horses constantly race over five and six furlongs, many of them which have a turn of speed, but are unable to travel a long distance, remaining on the turf for several seasons without being required to go farther than three-quarters of a mile when racing. The fact is that there are more short than long races, and it is easier to prepare a horse for a short race than a long one. Matters in this respect have improved in some degree during the past few years; but it is a fact that in 1900 there were 194 races at the eight Newmarket meetings, seventy-six of which were of less than six furlongs, and thirty-one of exactly six furlongs. The number of two-year-old races on all the programmes was perhaps the chief reason for such great numbers of short races, but since then there has been an increase in the number of middle-distance events, by which is meant races of over a mile, and not more than a mile and a half. All genuine stayers can run over a longer course than a mile and a half, and yet at the present day there are not more than half-a-dozen races which exceed two miles. The Alexandra Plate at Ascot of two miles six furlongs and a bit is the longest, the Ascot, Goodwood, and Doncaster Cups, the Jockey Club Cup, and the Cesarewitch are the others. The best horses are generally sent to the stud at five years of age, some even a year younger; and the price of blood-stock, though it has fallen from the ridiculous stage it reached just after the War, is still very high, more particularly for well-bred but untried yearlings which may or may not turn out successfully.

There are two sorts of races in every programme—viz. weight-for-age events and handicaps. In weight-for-age races the Jockey Club long ago issued a scale, which has once or twice been modified or revised. There is no need to quote it at length, but it gives different figures for five and six furlongs, for a mile, a mile and a half, two miles, and three miles, and it varies these slightly according to the month. All weight-for-age races, such as the classic events, the cup contests, and hundreds of everyday races for animals of every age, are on the weight-for-age plan, the scale for which ranges from 9 stone 10 lb., the weight to be carried by a six-year-old or aged horse over a three-mile course in March or April, down to 6 stone, the weight to be carried by a two-year-old over five furlongs in the same months. As a matter of fact two-year-olds are seldom opposed to old horses

before the Ascot meeting, and then they have to carry 26 lb. less than three-year-olds, and 35 lb. less than four-year-olds and upwards, over the shortest course which is used in racing. Horses which have won certain weight-for-age races are frequently penalised in future races, penalties varying from 4 to 14 lb., in accordance with the importance of the race. In the handicaps, weights are given to each individual horse by an official employed by the Jockey Club at Newmarket, and elsewhere by the executive of each race meeting. As a general rule the handicapper takes a margin of 3 stone, giving, for example, 9 stone to the horse he considers to be the best, and 6 stone to the horse he thinks of least account. With each handicap certain conditions are imposed when entries are asked for, and in nearly every race of this description penalties are imposed on horses which win after the publication of the weights. Penalised horses often win two or three handicaps off the reel. In some handicaps there is what is called an acceptance, which means that after the weights are published the owner, if not satisfied with the weight allotted to his horse, can strike him out of the race, and thus save paying the addition to his entrance-money, which running would involve. Every week a privately circulated newspaper is published, which gives the programme of the following week's racing, with the names of all the horses entered. It also gives entries for races which close long before they are decided, weights and acceptances for handicaps in the immediate future, and a great quantity of other official information which is extremely useful to the owner of horses, the trainer, and the officials of all the meetings. Racing on British lines has made great progress in Europe, in America, and the Colonies since about 1850; and though thoroughbreds are now reared in every country in which racing takes place, the fact remains that every now and then buyers are sent to this country with a view to replenishing the blood of nearly every country with further strains of British blood. The racing season in England begins near the end of March, and lasts until almost the end of November, so that eight months of the twelve are occupied. And at the end of each season there is a huge auction sale of blood-stock, much of which is bought for the foreign and colonial markets.

See W. Day's *Race Horse in Training*; Joseph Osborne's *Horse Breeder's Hand Book* (several volumes published between 1881 and 1898); Taunton's *Portraits of Celebrated Racehorses*; *The General Stud-book* and *The Racing Calendar* (annual volumes); Charles Richardson, *The English Turf* (1901); *A History of the English Turf*; *Ruff's Guide to the Turf*; W. Allison, *The British Thoroughbred Horse*; *Racing at Home and Abroad*, vol. i., by Charles Richardson, with a chapter on Training by the Hon. George Lambton; *Picks's Turf Register*; and *Orton's Turf Annals*. (The two last-named books are difficult to procure, and are of great value.)

Horse-radish (*Cochlearia Armoracia*), a perennial herbaceous plant, belonging to the natural order Cruciferae and to the same genus as scurvy-grass. It possesses the same antiscorbutic properties as the latter, but is better known popularly on account of its use as a condiment with roast-beef. It is highly stimulant, exciting the stomach and promoting the secretions, particularly that of urine. Its virtues depend upon a volatile oil similar to oil of mustard. The oil contains about 30 per cent. of sulphur to its other elements, and is recognised as one of the most powerful antiscorbutics known. Horse-radish is a native of south-eastern Europe, has long been cultivated in British gardens, and is naturalised in some parts of England and Ireland. For its perfect cultivation it requires very deeply-worked soil, from which it is

very difficult to eradicate, as the smallest bit of root not removed will emit a bud. Cases of fatal poisoning have several times occurred through the ignorant mistaking the roots of Monkshood (q.v.) for those of horse-radish. The former are powerfully poisonous; but there is no resemblance

between the two plants in any respect. The roots of horse-radish are long, tapering, cylindrical, with a cream-coloured skin. Those of monkshood are short, irregular in shape, blunt at both ends, and have a nut-brown skin. The root-leaves of horse-radish are from 9 to 18 inches long by from 4 to 6 inches broad, entire, but often toothed on the margins. Those of monkshood are roundish in outline, divided to the base into five to seven deeply-cut, linear, finely-pointed segments. The flowers of horse-radish, which are sparingly produced in Britain or the United States, are borne on branching stems about 2 feet high, and composed of four pure white spreading

Roots of Horse-radish (a) and Monkshood (b).

petals. Monkshood bears its flowers freely in handsome racemes, at the extremities of usually simple or unbranched stems; the colour is deep-blue, and the unopened flower strongly resembles a helmet or hood.

Horse-radish Tree. See BEN (OIL OF).

Horseshoeing. In olden times horses generally went unshod, as they now do in many Eastern countries; but our macadamised roads and paved streets, fast paces and heavy loads, speedily wear away the stoutest hoofs, and a rim of iron has accordingly been long in use as a protection. In style and pattern the horse's shoe varies almost as much as his master's boot, and like it, when badly made or unskilfully fitted, produces serious inconvenience, and even leads to accidents and diseases. When the feet are strong and properly managed nothing is better than a plain shoe of tolerably uniform breadth and thickness, carefully fashioned to the shape of the foot. But many good authorities prefer what is called a seated shoe, which has a level part for the wall to rest upon, and within that the inner half of the shoe towards the sole surface is bevelled off. This seated shoe is thus wider than the plain shoe, and hence affords greater protection for a weak or flat sole. For faulty or diseased feet special forms of shoes are made. In all healthy feet the shoe should be fitted to the foot, and not, as is commonly done, the foot cut to fit the shoe. Another frequent error must be avoided—keeping the shoe short and spare at the heels. For roadsters the toe of the fore-shoes should be slightly rounded up, which greatly obviates tripping. The hind-shoes are generally thickened and sometimes turned down at the heels. The number of nails required must

vary somewhat with the weight of the shoe and the soundness of the horn; five is the minimum, nine the maximum. It is important, however, that the shoes be firmly held on by as few nails as possible. In a saddle-horse with sound feet three on the outside and two on the inside should suffice to hold a well-fitted shoe. Horses for heavy draught

A sound Fore-foot prepared for the Shoe :

A, A, the heels of the crust; B, the toe cut out to receive the clip; C, C, the quarters of the crust; D, D, the bars, as they should be left, with the full frog between them; E, E, the angles between the heels and bars, where corns appear; F, F, the concave surface of the toe; G, G, the bulbous heels; H, the cleft.

are generally shod in Scotland with toe-pieces and heels, or calkins, which afford increased firmness of tread and greater power, especially when dragging heavy loads. To preserve the foot in a sound state the shoes should be removed every month. When the shoe is carefully taken off, the wall-surface on which it has rested should be rasped, to remove any ragged edges and any portions of adhering nails. Having for a month been protected from the wear to which the exposed portions of the foot are subjected, it will probably have grown considerably, and in a stout hoof will require to be cut down with the drawing-knife, especially towards the toe. Except in very strong feet and in farm-horses working on soft land, the surface of the sole uncovered by the shoe seldom requires to be cut. It is the natural protection of the internal delicate parts, and must be preferable to the leather and pads often artificially substituted for it. The bars must likewise remain untouched, for they are of great service in supporting weight; whilst the tough, elastic frog must be scrupulously preserved from the destructive attacks of the knife, and allowed uninjured to fulfil its functions as an insensible elastic pad, obviating concussion, and supporting weight. When the shoe is put on and the nails well driven home they should be broken off about an eighth or even a sixteenth of an inch from the wall, turned outwards, and hammered well down into it. This obviously gives the shoe a much firmer hold than the usual practice of twisting off the projecting nail close to the crust, and afterwards rasping down any asperities that still remain. When the shoe is firmly clinched the rasp may be very lightly run round the lower margin of the wall just where it meets the shoe, to smooth down any irregularities; but all further use of the rasp must be interdicted. The clinched nails if touched will only have their firm hold weakened; nor must the upper portions of the wall, which blacksmiths are so fond of turning out rasped and whitened, be thus senselessly

deprived of those external unctuous secretions which render the unrased foot so tough and sound and so free from sandcracks. The hoof cannot be too dry and tough. From time to time various attempts have been made to fix shoes to horses' feet without nails; and a shoe has been invented which is said to have answered the purpose; but in the opinion of many the system is still immature, and requires to be more extensively tested.

Horsetails (*Equisetum*), a genus of herbaceous plants which in itself, along with fossil forms, such as Calamites (q.v.), constitutes the singular natural order Equisetaceae, classed along with ferns and lycopods as Pteridophyta. The family is distinguished from all others by the almost leafless, articulated, and whorled stems and branches, which in structure and character closely resemble some of the larger fossil plants now extinct. They are separated from all other plants also by their fructification, which is an ovoid or oblong terminal cone-like spike, consisting of several whorls of peltate, shield-shaped, short-stalked brown or black scales, under each of which are six or seven capsules filled with minute spores, and opening on the inner side. Under the microscope there will be seen attached to the base of each spore four thread-like filaments, or elaters, club-shaped at the apex, rolled spirally round the spore when moist, but uncoiling elastically when dry. By the entangling of these a number of spores are kept together, a matter of some importance, since the spores, though apparently of one kind only, produce diceious prothalli. A perennial rhizome sends up shoots each year, sometimes of two kinds, vegetative and reproductive.

The species of horsetail are few in number, although widely diffused in the temperate and colder regions of the northern hemisphere, becoming rare in the tropics. Nine species occur in Britain, usually in moist or marshy places, but they adapt themselves easily to a great variety of stations, and are almost ineradicable where they obtain a footing in either field or garden. Diuretic and other medicinal properties have been ascribed to them, but apparently on slight grounds. They all contain a large quantity of silica in the cuticle of their stems, which has rendered them useful in polishing metals, marbles, ivory, cabinet-work, &c. *E. hyemale* is the most favoured species for these purposes, and it is imported in considerable quantity from Holland under the name *Dutch Rushes*.

Horsham, a market-town of Sussex, near the source of the Arun, 26 miles NNW. of Brighton and 35 SSW. of London. The noble parish church, Early English in style, was restored in 1865; other buildings are the corn exchange (1766), grammar-school (1540; rebuilt 1840-57), &c. Brewing, tanning, iron-founding, and coach-building are carried on. Horsham returned two members of parliament from the 14th century till 1832, and one down till 1885. East of the town is St Leonard's Forest, and 2 miles NW. Field Place, Shelley's birthplace. Christ's Hospital (q.v.) was transferred to West Horsham in 1897-1902. Pop. 11,400.

Horsley, SAMUEL, an English prelate, was the son of a clergyman, and was born at London in 1733. He was educated at Westminster School and Trinity Hall, Cambridge; and in 1759 succeeded his father as rector of Newington, in Surrey—a living which he held for thirty-four years, though he also enjoyed in the interval many other preferments, including the archdeaconry of St Albans (1781). In 1767 he became fellow, in 1773 secretary, of the Royal Society; in 1774 he published his *Remarks on the Observations made in the late Voyage towards the North Pole, for determining the Acceleration of the Pendulum*; and two years afterwards he issued proposals for a complete

edition of the works of Sir Isaac Newton, which, however, did not make its appearance till 1785. But the grand event in his career was the controversy with Priestley, in which he displayed remarkable learning and acuteness, somewhat marred by intolerance and contemptuous bitterness. The work that excited the controversy was Dr Priestley's *History of the Corruptions of Christianity*, among which corruptions was included the orthodox doctrine of Christ's uncreated divinity. Horsley reviewed the work with great severity in his charge delivered to the clergy of his archdeaconry in 1783. Priestley replied, Horsley retorted, and there were further replies and retorts, Horsley's contributions being published collectively in 1789. Other works besides sermons were on Hosea, the Psalms, biblical criticism, and classical subjects. He was zealous in parochial work, a powerful preacher, keen against the slave-trade, non-residence, and Sabbath desecration, and though a high Tory supported Catholic relief. Successively bishop of St Davids (1788), of Rochester (1793), and St Asaph (1802), he died 4th October 1806.

Horsley, SIR VICTOR ALEXANDER HADEN (1902), F.R.S., born at Kensington, 14th April 1857, a son of John Calcott Horsley, R.A. (1817-1903), studied at University College, London, was Croonian lecturer to the Royal Society, Fullerian professor (1890-93) at the Royal Institution, professor of Pathology in University College (1893-96), and secretary to the Royal Commission on Hydrophobia. He served in the South African war and the Great War, and died of heat stroke in Mesopotamia, 16th July 1916. As a physiologist and surgeon he was distinguished for his work in the localisation of brain functions and in the treatment of myxedema. See *Life* by Stephen Paget (1919).

Hort, FENTON JOHN ANTHONY, D.D. (1828-92), born in Dublin, graduated at Cambridge as third classic, and was a fellow of Trinity (1852-57), and from 1878 professor of Divinity. With Westcott (q.v.) he edited a Greek text of the New Testament. See his *Life and Letters* (1896).

Hortense. See BONAPARTE.

Hortensius, QUINTUS (114-50 B.C.), Roman orator, largely devoted himself to the defence of aristocratic offenders, such as Verres. His countless speeches are known to us only by the merest fragments.

Horthy de Nagybánya, NIKOLAUS, Hungarian admiral and regent, born at Kenderes in 1868, studied at Fiume naval college, and became aide-de-camp to Francis-Joseph. He had already won some successes when in 1918 he was given command of the Austro-Hungarian fleet in the Adriatic. On the fall of the Soviet government in 1919 he took the lead of the counter-revolutionaries, and was elected regent. Hungary was declared to be still a monarchy, but Horthy refrained from participation in Karl's attempts to regain the throne.

Horticulture. See GARDENING.

Hortus Siccus. See HERBARIUM.

Horus, an Egyptian god, son of Osiris and Isis. See EGYPT, ISIS.

Horvath, MICHAEL (1809-78), professor of Hungarian in Vienna, Bishop of Csanad, and, in the revolutionary war, minister of public instruction, returned from exile in 1867, and is remembered for his great history of Hungary (1842-65).

Horwich, a Lancashire town, 4 miles WNW. of Bolton, with cotton, paper, and other manufactures. Pop. (1881) 3761; (1921) 15,616.

Hosea (Heb. *Hôshē'a*; LXX. *Osēe*; Vulg. *Osee*), the first in order of the twelve minor prophets, is nowhere mentioned in the Old Testament except

in the book which bears his name. From this source we learn that he was a citizen of the kingdom of Israel (see i. 2, where 'the land' is plainly the northern kingdom, and vii. 5, where 'our king' is the king of Samaria), that his father's name was Beëri, and that he prophesied during, and apparently also after, the reign of Jeroboam II.—i.e. from about the middle of the 8th century B.C. The fourteen chapters which preserve to us all that we know of what may have been a long period of prophetic activity are plausibly believed to have been edited by himself and given to the world in writing towards the close of his life. The first three derive a special interest from their autobiographical element. The remaining eleven consist of a series of prophecies, mostly of a threatening character, relating to the kingdom of Israel. The details of these present many exegetical difficulties, and it is impossible to determine with any certainty what may have been the precise circumstances under which each oracle was originally delivered. Some relate to the still outwardly prosperous times of Jeroboam II., and others, most likely, to the troubled years that immediately followed. They point generally to an exceedingly dissolute internal condition of society, which ultimately drove the prophet to the verge of despair, and out of which he saw no escape save in the destruction of the kingdom, to be followed by a final restoration brought about in some unexplained way through the sovereign love and mercy of Jehovah. The question of greatest interest to interpreters of the Book of Hosea is that connected with the narrative of the first three chapters, in which the prophet relates how the experiences of his married life furnished him with his prophetic message. In the opening words we read of his marriage to Gomer bath-Diblaim, by whom he had three children to whom he gave the significant names, Jezreel ('Jehovah shall sow'), Lo Ruhamah ('not pitied'), and Lo Ammi ('not my people'). Her profligate conduct after marriage led to a separation, but, in obedience to a divine call, he took her back; and in the ultimate victory of marital love over a wife's infidelity he saw the token and the promise of the final triumph of Jehovah's grace over Israel's sin. According to the modern view, first suggested by Ewald, further elaborated by Wellhausen (in 4th ed. of Bleek's *Einleitung*) and Robertson Smith, and now adopted by most scholars, Hosea, i. 2, is to be interpreted in the light of such a passage as Jer. xxxii. 8, where we have a clear instance of recognition of a divine command only after the deed has been accomplished, and there is therefore no necessity for supposing that Hosea was aware of the profligate character of Gomer bath-Diblaim when he married her, or indeed that her profligacy had declared itself at that time. Earlier interpreters either took the passage literally and argued that a marriage which otherwise would have been contrary to all sound moral feeling was justified by a divine command, and that the repulsive elements in it magnified the obedience of the prophet; or they treated it as an allegory, without much attempt to explain how a proceeding which would be objectionable in fact ceases to be so in the realms of fiction.

For a full discussion of Hosea and his prophecies, see W. R. Smith, *Prophecy of Israel* (ed. Cheyne, 1902), and W. R. Harper, *Amos and Hosea* (*Internat. Crit. Comm.*, 1905). See also the commentaries on the minor prophets generally—Ewald, *Propheten* (Eng. trans. 1876); G. A. Smith, *Expositor's Bible* (1896, 1898); Marti (1904); R. F. Horton (Hosea-Micah) and Driver (Nahum-Malachi, *Century Bible*, 1906); A. van Hoonacker (1908). There are works on the Hebrew text by Wellhausen (1898) and Duhm (1911), and a general introduction on Hebrew prophetism by Hölzner (*Die Propheten*, 1914).

Hoshangabad, chief town of Hoshangabad district (area, 3682 sq. m.; pop. in 1911, 457,395), in the Central Provinces of India, stands on the Nerbudda River, 40 miles SSE. from Bhopal. It does a lively business in English piece-goods, cotton, grain, &c. It has been in British hands since 1817. Pop. 12,000.

Hoshiarpur, capital of a district in Punjab, near the foot of the Siwalik Hills, 90 miles E. from Lahore. It is the seat of an American Presbyterian Mission. Pop. 21,000.

Hosiery, in its most limited sense, refers to the manufacture of stockings (hose); but in its more general application it comprises all knitted goods, whether made by hand or by machinery. The use of hose or stockings originated in the cold countries of the north, and probably the first were made of skins, and subsequently of cloth. Illuminations in ancient MSS. show that these nether garments were worn by the Anglo-Saxons and the Normans. The art of knitting was invented (it is supposed in Scotland) in the 15th century. Certain it is that knitted stockings found their way to France from Scotland, and led to the establishment of a guild of stocking-knitters, who chose for their patron saint St Fiacre of Scotland (really an Irish monk of the 6th century, the patron of gardeners). In 1589 William Lee, of Woodborough, Nottinghamshire, entirely altered the hosiery trade by inventing the knitting-frame, or stocking-frame; and, although he did not live to enjoy much benefit himself from it, it soon became a very important feeder to the commerce of Great Britain.

The first improvement of marked importance on Lee's machine was the ribbing apparatus invented by Jedediah Strutt in 1758. This consisted in adding a second series of needles, with an arrangement for working them, to Lee's machine, which could only make a plain, not a ribbed, web. Sir Marc I. Brunel invented, in 1816, a circular knitting-frame, to which he gave the name of *tricoteur*. This produced a tubular web, and was a meritorious machine, but it did not come much into use till it was improved, about 1844, by Claussen of Brussels. His further modification of it in 1847 caused it to be widely adopted, and it has received various improvements since. Several important improvements in hosiery machines are due to Townsend, chief among them being a tumbler or latch needle, patented by him in 1858, which is now largely employed in certain kinds of knitting-machines, especially those for fancy hosiery and for domestic use. Fig. 1 shows two views of this

Fig. 1.

needle. A represents it with the hinged latch or tongue folded back on the stalk so that the hook may catch the thread. B shows the latch closed on the point of the hook so that it may freely pass a new loop of thread through the last-formed loop. The latch is moved by the loops of thread or yarn during the action of the machine. The modern form of Lee's needle is shown in the other figures. The most prominent name among the improvers of hosiery machines in comparatively recent times is that of William Cotton of Loughborough. Between 1851 and 1869 he devised arrangements both for narrowing and widening the fabric, and in conjunction with Attenborough made a number of alterations for the better on the general arrange-

ments of the parts of the knitting-frame. Some of the best hosiery machines driven by steam-power now in use are on Cotton's system.

The names of two Americans appear in the list of those who have contributed to the advancement of knitting machinery. In 1858 an English patent was taken out by W. C. Gist for a circular machine, which, by using several feeders instead of one, enabled striped work with as many as sixteen colours to be made at once. Another English patent was taken out in 1877 by Almet Reid for a circular knitting-frame for making automatically articles of many different shapes, in which the loops or stitches are so locked together as not to unravel when cut or torn.

A knitted fabric of one colour consists of one continuous thread instead of a warp and a weft thread as in weaving, and the knitting done by a machine is exactly of the same nature as that done by hand. With the aid of the accompanying illustrations a brief description will suffice to explain the principle on which a knitting-machine or stocking-frame works. A perspective sketch of a

Fig. 2.

part of a division of the machine is given in fig. 2. The hooked needles (Lee's) are shown at A, B, C, D, E. The 'sinks,' J, K, L, M, N, are thin plates of steel, which have a backward and forward motion, each sinker passing between two needles. When the sinks are moved to the left of their position in the figure a space occurs between them and the needles, along which the thread or yarn is laid. As the thread proceeds along the face of the needles the sinks one by one advance and thrust the thread between them, thus forming a row of loops, after which the sinks retire.

All the needles act simultaneously and in the same way; but to make the action of the machine

Fig. 3.

Fig. 4.

more easily understood, figs. 3, 4, and 5 show the movements of a single needle. Fig. 3 represents, in side elevation, the position of a sinker, a comb, and a needle, at the moment when the needle has

sunk between the sinkers, till the newly-formed loop of thread, O, enters the hooked portion or open eye. The needle, continuing its descent, is rocked forward till, as shown in fig. 4, the 'beard' of the hook comes against the 'presser bar' P, which presses for a moment the point of the beard into a groove on the stem, and so forms a closed eye round the loop O. The needle, in further descending, pulls this loop through the last-formed loop of the knitted fabric. It is in this closing of the hook to enable the one loop to be drawn through the other that the great ingenuity of Lee's invention lies. Fig. 5 shows the new loop just pulled through, and then the needle, rocking forward in the direction of the arrow, ascends, while the loop slips down its stem. The next loop is pulled through in the same way. The explanation just given of the motion of one needle applies to all the needles, as they are fixed in line on a rigid bar.

Fig. 5.

Fig. 6 shows an enlarged plan of five rows of loops, in which the triangular dots, Nos. 1, 2, 3, 4, 5, 6, 7, and 8, in the last-formed row are the needles with the thread-carrier, T, in the position where it commences to lay the thread in front of them. The knitted fabric is wound upon a roller as fast as it is formed. It would take up too much space to describe the arrangement for narrowing or widening the fabric, to bring it to the shape of a stocking for example. This is called 'fashioning.' The web, however, is often not shaped in the process of knitting, but cut, when finished, into any form required, as is done with ordinary cloth.

Fig. 6.

Circular knitting-machines, producing seamless hosiery, have largely superseded the earlier types on account of their greater speed and capacity. They are of American origin; and in America some 2000 patents for knitting machinery had been taken out by the end of the 19th century. There are various kinds of sewing, seaming, and basting machines for putting together or joining hosiery and knitted goods, and these have almost entirely superseded hand-sewing. A vast variety of knitting-machines are now made both for factory work and for domestic use. A pretty usual type of modern knitting-frame may make loops at the rate of 250,000 loops a minute, as compared with, say, 100 done by an expert hand-knitter.

Nottingham and Leicester, especially the former, are the chief centres of the hosiery manufacture in the United Kingdom, but it is found also in the adjoining counties and in the south of Scotland. It is extensively carried on in France, Germany, and other continental countries.

Hospice, the name given to the pious establishments for sheltering travellers, maintained by monastic persons, usually in connection with monasteries. One of the best known in inhospitable regions is that on the Alpine pass of Great St Bernard (see ST BERNARD), of which mention is made as early as 1125. Travellers were till 1925 lodged and boarded gratuitously, those who could depositing a suitable present in the alms-box. Similar establishments are found on the Simplon, the Little St Bernard, and the Bernina.

Hospitalers, in the Roman Catholic Church, are charitable brotherhoods, founded for the care of the poor and of the sick in hospitals. They follow

for the most part the rule of St Augustine, and add to the ordinary vows of poverty, chastity, and obedience, that of self-dedication to the particular work of their order. The Knights of St John of Jerusalem (see below) and the Teutonic Knights (q.v.) were both originally hospitaliers. The Knights Hospitaliers of the Holy Spirit were founded at Montpellier in 1198 by Guy of Montpellier, and the hospitaliers of Our Lady of Christian Charity at Paris in the end of the 13th century by Guy de Joinville. And numerous similar orders have been established since then.

THE ORDER OF THE KNIGHTS OF ST JOHN OF JERUSALEM, otherwise called the Knights of Rhodes, and afterwards of Malta, a celebrated military and religious order of the middle ages, originated about 1048 in a hospital, dedicated to St John the Baptist, which some merchants of Amalfi built at Jerusalem for the care and cure of pilgrims to the Holy Sepulchre. After the conquest of Jerusalem by the crusaders under Godfrey of Bouillon in 1099, the hospital servants were joined by many from the Christian army, who resolved to devote themselves to the service of the poor and sick pilgrims. Gerard, the first rector of the hospital, formed them into a regularly-constituted religious body, bound by the vows of poverty, chastity, and obedience, and subject to the jurisdiction of the Patriarch of Jerusalem. Pope Pascal II. gave his sanction to their institution as an order in 1113. Raymond du Puy, the successor of Gerard, extended the activity of the order by pledging its members to protect pilgrims on the roads from the sea to the Holy City. Soon afterwards the order became predominantly military: the Hospitaliers were sworn to defend the Holy Sepulchre to the last drop of their blood, and to make war upon the infidels wherever they should meet them. Having become military as well as religious, the order was recruited by persons of high rank and influence, and wealth flowed in from all quarters. Various hospices, called commanderies, were established in the maritime towns of Europe as resting-places for pilgrims, who were there provided with the means of setting out for Palestine. These branch establishments also collected the revenues of the order, and received candidates for admission to its ranks. After the conquest of Jerusalem by Saladin the Hospitaliers established themselves at Acre in 1191. Soon afterwards a bitter rivalry sprang up between them and the Knights Templars, which finally set them in battle array one against the other in 1259, when victory inclined to the former. The Hospitaliers clung with desperation to Acre, the last Christian stronghold in Palestine; but after a terrible siege by the ruler of Egypt, they were compelled to sail away to Cyprus (1291), where the king of the island gave them an asylum for some years.

In 1185 Frederick Barbarossa took the order under the protection of the empire. In the following century the title of 'master' was changed by Pope Clement IV. into 'grand-master.' The brethren consisted of three classes, knights, chaplains, and serving brothers, these last being fighting squires, who followed the knights in their expeditions. The order was in the 12th century divided into eight 'languages'—Provence, Auvergne, France, Italy, Aragon, England, Germany, and Castile. Each 'language' embraced several grand-priories, and under these again were a number of commanderies.

In 1310 the knights, under the grand-master Fulk de Villaret, in conjunction with a party of crusaders from Italy, captured Rhodes and seven adjacent islands from the Greek and Moslem pirates, and carried on from thence for more than two hundred years a successful war against the Turks. During this period the Hospitaliers were the owners

of nearly 19,000 manors in Europe, and to these 9000 more were added on the suppression of the Knights Templars in 1312. In 1523 they were compelled to surrender Rhodes to Sultan Solymán, and retired to Candia (Crete). In 1530 Charles V. assigned them the island of Malta, with Tripoli and Gozo. Tripoli was surrendered in 1551 to the corsair Dragut, who in 1565 laid siege to Malta, which the Hospitaliers had strongly fortified. Dragut was beaten off at the end of four months with the loss of 25,000 men. The knights continued for some time to be a powerful bulwark against the Turks; but after the Reformation a moral degeneracy overspread the order, and it rapidly declined in political importance. In 1798, through the treachery of some French knights and the weakness of the last grand-master, Hompesch, Malta was surrendered to the French. The lands still remaining to the order were about this time confiscated in almost all the European states; but, though extinct as a sovereign body, certain branches of the order, with more or less just claims to legitimate succession, have survived into the 20th century, many as philanthropic societies, in Italy, France, Spain, England, and Germany. After 1801 the office of grand-master was not filled up, till in 1879 the pope appointed a grand-master for the Italian and Bohemian 'languages.' In their military capacity the Hospitaliers wore red surcoats over their armour. The badge worn by all the knights was a Maltese cross, enamelled white and edged with gold. The motto of the order was 'Pro fide,' with the later addition of 'Pro utilitate hominum.'

Two modern associations have ascribed their origin to the original order—the Brandenburg 'Johanniterorden' and the English order of the Knights of St John. The former, a direct descendant of the German 'language' of the old legitimate order, was reorganised in 1853 and 1893, and did good service. In England the property of the old order was confiscated by Henry VIII. in 1541. (Torphichen, the headquarters in Scotland, was surrendered in 1547 by the preceptor, who became Baron Torphichen.) Nevertheless the 'language' of England was resuscitated in 1827; the revived society has its headquarters at St John's Gate, Clerkenwell, London. Its efforts are purely philanthropic: it distributes charity to convalescents from hospital, maintains cottage hospitals and convalescent homes, and gives honours for heroism to firemen, miners, and policemen. It founded the street ambulance system, and was chiefly concerned in the origination of the Red Cross (q.v.) Society.

See Histories of the order by Bosio, Del Pozzo, Vertot (Eng. 1728), Taaffe (1852), Porter (1883), De Salles (1889); Delaville de Roux's *Les Archives, la Bibliothèque, et le Trésor de l'Ordre de St-Jean à Malte* (1883); Baron de Delabre, *Rhodes of the Knights* (1909); H. W. Fincham, *The Order of the Hospital of St John of Jerusalem* (1915); Mgr. Mifsud, *Knights Hospitaliers* (1917); Symons-Jeune, *Order of St John of Jerusalem* (1922).

Hospitals are so called from the mediæval *hospitia*, or more properly the class of hospitals established very generally for the reception and relief of lepers, whose malady was one of the scourges of Europe. These leper hospitals were very commonly in England and in Scotland called 'Spitals'; hence the frequency of such names of places as Spital, Spitalfields, &c. The leper hospitals and other kinds of the old *hospitia* disappeared with the improvement of society, and substitutes for them on a broader scale began to be established in the modern form of hospitals. Of public establishments under this general designation there are now, as is commonly known, three distinct classes—hospitals for the reception and treatment of the sick and hurt, hospitals for the

board and education of children, and hospitals for the reception and permanent board of poor old persons of both sexes. As in the present work the more remarkable hospitals receive some notice under their respective heads, we need here only offer a few general observations.

Hospitals for the sick and hurt are in some parts of England and Scotland termed *Infirmaries*. Under whatever designation, institutions of this kind are now established in all parts of the civilised world. They are supported in most cases on a principle of charity, but in some special instances from the funds of the state or the civic municipalities. The primary or more important object of all such institutions is to mitigate bodily suffering, whether that arises from natural or accidental causes, in which respect they are indispensable as a refuge to all who are unable to pay for private medical or surgical aid, or as a convenient means of succour on emergencies to persons of every rank and degree of opulence. While such is the main object of these benevolent institutions, they are also serviceable as schools for medicine and surgery; as such, no university, at which these and kindred branches of learning are taught, can be said to be complete without the adjunct of a well-organised hospital, where professors can practically educate their pupils by pointing out varieties of disease and injuries, and exemplifying methods of treatment. Hence the best specimens of hospitals are found in university towns—as in London, Paris, Edinburgh, and some other cities famed as schools of medicine and surgery. The older of the London hospitals are St Thomas's (1553), St Bartholomew's (1546), and Bedlam or Bethlehem (1547), to which may be added the Westminster (1719), Guy's (1725), the Lock (1746), St George's (1733), the London (1740), the Middlesex (1745), and University College (1833). A considerable accession to the number took place in the reign of George II., when society became alive to the value of such institutions. It was at this period that the Royal Infirmary of Edinburgh was established (1730). The antiquity of British hospitals sinks into insignificance in comparison with that of some institutions of this kind on the Continent. The *Hôtel Dieu* in Paris, which is alleged to be the most ancient hospital in Europe, was founded in the 7th century, and, long known as the *Maison Dieu*, received the benefactions of successive sovereigns.

In London, Paris, and other large seats of population, besides the general hospitals, there are now lying-in hospitals, ophthalmic hospitals, consumptive hospitals, children's hospitals, &c.—each with its peculiar accommodation and staff of officials. Convalescent Hospitals (q.v.) are a valuable adjunct to ordinary hospitals for the sick. Independently of these there are hospitals for the treatment of mental maladies, of which Bethlehem and St Luke's in London, and the establishments in Paris, known as *Hospices*, are examples. To this class of institutions belong lunatic asylums, also asylums for the reception and treatment of naturally imbecile children; these last, though in operation for some time in France and Switzerland, being but of recent establishment in Great Britain. To these must be added the isolation hospitals for the treatment of smallpox, scarlet-fever, and other forms of infectious diseases, which have been established in recent years by every energetic sanitary authority out of the rates. Besides these institutions under civil administration are those hospitals which are maintained by the English, French, and other governments for the military and naval services. In the United States, where every medical college has its own hospital, or the right to teach in the wards of public institutions, there are also many hospitals

or asylums for inebriates (see *INEBRIATES*), for opium-users, and those addicted to the use of other narcotics (see also *FOUNDLING HOSPITALS*, *AMBULANCE*).

Until the middle of the 19th century the organisation and management of hospitals and the nursing of the sick in Britain and in most parts of Europe were, except in some few instances, extremely defective. Public opinion was then aroused on the question, and certain principles were laid down on hospital construction and hospital nursing which have been recognised and adopted to a greater or less extent since that time. These principles may be briefly summed up as follows under the three heads: (1) Construction, (2) Administration, (3) Nursing.

(1) *Construction*.—The first object is to obtain pure air in and around the building. The purity of air around will depend upon the site. The soil should be clean and dry; the position should admit of free circulation of air untainted by surrounding sources of impurity or damp. The number of sick who can be placed on a given site depends on the form of the buildings in which they are to be placed. It is now considered that more than 100 patients should never be under the same roof. And less is better. This has led to the pavilion form of building being adopted—blocks connected by corridors. Two floors only of patients' wards are admissible, but hospitals with only one floor for the ward accommodation are now universally recognised as best. More than three is insanitary. Hospital buildings consist (a) of the wards for the reception of the sick, and their appurtenances; these necessarily form the basis of the design; subsidiary to these are the operating theatre, &c.; and where there is a medical school instructional accessories have to be provided. (b) The buildings for administration—i.e. for lodging the staff, the kitchen, stores, and dispensary, should be always subordinate to the question of the accommodation for sick. In some hospitals extra out-patients' departments are provided. These should never be placed under the same roof with the wards for the sick.

(a) The first principle of the ward unit is that the ward and ward offices should be self-contained within one door commanded by the head-nurse's room, so that at any moment she may know where every patient is. The size of the wards has to be somewhat guided by economy of administration, so as to enable the largest number of patients to be nursed by a given number of nurses. The limit of the ward is practically the number who can be efficiently nursed under one head-nurse. Each ward may have subsidiary to it one or two small wards for bad cases.

The ward appurtenances consist partly of nursing accommodation and partly of offices for patients. The nursing accommodation includes a bedroom for the head-nurse; a serving room in which food can be warmed, drinks and extra diets made, and linen kept and aired, hot water obtained, poultices, &c. made; also a nurses' water-closet near. The head-nurse's room should be so placed as to enable the nurse to exercise constant supervision over the ward and the patients. The offices for patients comprise a lavatory for the patients, a bath-room and water-closets in the proportion of about 3 to 10 per cent. of the number of patients—the general hospital for acute cases, mostly in bed, requiring the lesser number—one or more slop sinks, a place for keeping ejecta of patients for medical inspection. These appurtenances should be cut off from the ward by ventilated lobbies, and should be always warmed and ventilated independently of the ward.

The form of the ward should be such as to enable the air to be renewed with the greatest facility.

Experience in this climate shows that the windows are the best appliance for complete renovation of the air. For this purpose they should be on opposite sides of the ward, and the wards should not exceed from 20 to 28 feet in width. There should not be above two rows of beds between the windows. The rectangular form enables these conditions to be best fulfilled in the case of large wards. Where the wards are not intended to contain more than from four to eight patients a circular form of ward has been in some cases found unobjectionable; but as it is a principal object in hospital construction to provide a large wall space in proportion to the floor and cubic space per bed in the wards, and as the rectangular form affords the largest, and the circular form the smallest wall space in proportion to the area of the ward, it is evident that the rectangular form is that best adapted to sanitary requirements.

(5) The subsidiary accommodation should be so arranged as not to interfere with the purity of air in or around the wards. The fewer places in and about the ward the better. Not only the best arrangements, but what use will be made of them, has to be considered. The sleeping accommodation for nurses should be so placed as to ensure purity of air in the dormitories, and complete quiet for the night-nurses to sleep by day.

(2) *Administration* is intended to enforce economy so far as it is consistent with the provision of requirements for the sick. It is usually in the hands of a governing body, which issues all regulations after consultation with professional advisers; it controls the expenditure and raises the funds to support the hospital. The governing body acts through its superintendent, who should be a medical man with great experience, for the general discipline and control of expenditure. The well-being and cure of the patients is directed by the professional staff of medical officers, which consists of visiting physicians and surgeons and of resident medical officers, who control the treatment of the patients under their direction and in the absence of the visiting medical officers. The nursing of the sick is under a trained matron or lady superintendent, who should be the head of all the women employed in the hospital.

(3) *Nursing* the sick and injured is performed usually by women underscientific heads—physicians and surgeons. Nursing is putting us in the best possible conditions for nature to restore or to preserve health—to prevent or to cure disease or injury. The physician or surgeon prescribes these conditions—the nurse carries them out. Health is not only to be well, but to be able to use well every power we have to use. Sickness or disease is nature's way of getting rid of the effects of conditions which have interfered with health. It is nature's attempt to cure—we have to help her. Partly, perhaps mainly, upon nursing must depend whether nature succeeds or fails in her attempt to cure by sickness. Nursing is therefore to help the patient to live. Nursing is an art, and an art requiring an organised practical and scientific training. For nursing is the skilled servant of medicine, surgery, and hygiene.

Nursing proper means, besides giving the medicines and stimulants prescribed, or applying the surgical dressings and other remedies ordered, (1) the providing and the proper use of fresh air, especially at night—i.e. ventilation—and of warmth or coolness; (2) the securing the health of the sickroom or ward, which includes light, cleanliness of floors and walls, of bed, bedding, and utensils; (3) personal cleanliness of patient and of nurse, quiet, variety, and cheerfulness; (4) the administering and sometimes preparation of diet; (5) the application of remedies. See NURSING.

Fever Hospitals, distinct from those for the treatment of surgical and ordinary medical cases, are essential for securing the isolation of patients in infectious diseases; hospital ships or floating hospitals have been found extremely valuable for securing complete isolation in cases of virulently infective disorders such as Small-pox (q.v.).

Poor-law Infirmaries.—Since 1870 poor-law or parish infirmaries for the sick and infirm, who used to be harboured (not treated) in workhouses and nursed by paupers, have been built, and are served by trained nurses. Some difference exists between the essentials for general hospitals and for poor-law infirmaries—the latter having no medical schools, no visiting or resident medical officers, except the resident medical superintendent and his assistant, no accidents or operations. The large majority of patients in them are chronic, not acute, cases, and incurables. A smaller nursing staff in proportion is needed. Some few of the best and largest have now training-schools for nurses. Since 1875 Metropolitan Board asylums, supported also by the rates, have been built near London for fevers, for small-pox, for idiots and imbeciles, &c.

Lying-in Hospitals.—The lying-in hospitals require special consideration. The continuous use of wards for this purpose appears to be very dangerous to the patients. Indeed this would seem to be the reason why there are fewer casualties from this cause in workhouse infirmaries than in the ordinary lying-in hospital, and why the lying-in at home is safer than either.

In Paris, where this subject has been much considered, two forms have been tried with good results. In one each patient has a small ward to herself, with its scullery or service-room attached, opening through a covered porch into an open veranda. After each confinement the ward is cleaned and lime-whited before further occupation. In these wards fatal results have been very rare. Another form is to have a ward which can hold two or more beds, in one of which the patient is brought for the delivery, and after a few hours she is wheeled out in the bed into a large ward where she remains with other patients who have also been delivered. With this plan also, where the delivery ward is cleaned and lime-whited at short intervals, and where two delivery wards are in use alternately, one always standing empty, fatal results have been rare. Instances of both forms of lying-in hospitals are not unknown in the United Kingdom. But it would be well if they were more universal.

Children's Hospitals must be provided with establishments for bathing, playing indoors and out, large garden-grounds, gymnastic grounds and halls, in and out of doors; the gymnastics should be under a professor, and out-patients should be always admitted. A 'sister' must superintend each of all these places. Singing in chorus is to be taught. It is a matter of universal hospital experience that intermingling of ages is essential. If you have a children's hospital, let the age of admission include fifteen years, especially on the female side. In all hospitals (in a child's hospital much more than in others) the patient must not stay a day longer than is absolutely necessary. Every child's hospital ought to have a *convalescent* branch at a distance; if possible by the sea. Sick children can never be left alone for a moment. One might almost say a nurse is required for every child. This is why in a general hospital it is much better for the children to be mixed with the adults; and, if they are judiciously distributed, it does the woman in the next bed as much good as it does the child, or the man as it does the little boy. If there *must* be a children's ward in a general hospital, let it be for the infants.

Convalescent Hospitals must be as like a home and as unlike a hospital as possible. A string of detached cottages is the best, admitting of extension by the addition of similar parts. Convalescent wards in a general hospital are not good; nor are day-rooms. Healthy open position and climate must be carefully selected. The convalescents are only to sleep at night in their rooms, while in the day they are 'out and about,' or occupying themselves—the men in the garden, the women at household work. But there must be strict discipline. There must be two small wards for relapses next the 'sister's' room, in the centre cottage. The convalescent beds may be divided by curtains, to be pulled far back in the day-time. A wash-hand stand to be permitted within—no lavatory. Three or four beds a good number for each convalescent room. Men and women should have separate cottages, and only meet at meals. Every hospital should have its convalescent branch, and every county its convalescent home.

Hospitals for Incurables should admit all diseases certified by competent medical judges to be hopelessly incurable—except mental diseases, which require special arrangements. One well-known hospital for incurables excludes epilepsy because it frightens the other patients; avoids, if possible, congenital and infantile disease; prefers patients of and above middle age; and excludes children and all under twenty years. The cases treated by incurable hospitals are principally cases of chronic rheumatism, gout, paralysis, and various affections which cripple the limbs, &c. These hospitals, while treating cases within their walls, are no doubt productive of great benefit to the community; but the system of granting pensions from the hospital funds to out-patients is very questionable.

A Samaritan fund is generally provided to assist poor patients leaving hospitals who may be deficient in clothing or other necessities. In public *Dispensaries* (q.v.), at stated hours, medical advice and medicines are given gratis to applicants; in recent years provident dispensaries have been established, supported by subscriptions, entitling the subscriber to advice and medicine. Valuable establishments are those called in France *Maisons de Santé*—private hospitals for the reception and treatment of patients who are able and disposed to pay a small sum for board and medical or surgical attendance.

HOSPITAL SUNDAY. On one Sunday in the year it is the practice for churches of almost every denomination in London and throughout the provinces to have special collections for the support of the hospitals of the country. In London the movement originated in 1873; Aberdeen claims to have begun the practice in 1764.

See ANTISEPTICS, DISINFECTANTS, GERM, HYGIENE, INFECTION, MEDICINE, NURSING, PYÆMIA, SURGERY; Burdett, *Hospitals and Asylums of the World* (4 vols. 1893, with supplements to 1905); Billings and Hurd, *Hospitals, Dispensaries, and Nursing* (1895), and other works by the same authors; Moust and Snell, *Hospital Construction and Management* (1884); Clifford Smith on *Administration of Hospitals* (1863); Douglas Galton, *Construction of Hospitals* (1870), and *Healthy Hospitals* (1893); Wylie, *Hospitals* (New York, 1877); Tollet, *Les Edifices Hospitaliers* (1892). Much has of late years been done in setting apart special accommodation throughout the country for infectious diseases.

Hospodar, a Slavonic title once commonly given to the governors of Moldavia and Wallachia, whereas the king of Rumania is now known under the native Rumanic title of *Domnu*. Lithuanian princes and Polish kings also bore the title.

Host (Lat. *hostia*, 'a victim'), the name given in the Roman Catholic Church to the consecrated bread of the eucharist. It is so called in conformity

with the doctrine of that church that the eucharist is a 'sacrifice,' in the strict sense of the word, though, in the common language of Catholics, 'host' is used for the unconsecrated altar-bread, and even so occurs in the offertory of the Roman missal. The host in the Latin Church is a thin circular wafer (in Old English, 'synging cake') of unleavened bread, made of the finest flour, and bearing stamped upon it the figure of the Crucifixion or some emblematic device, as the Lamb, or the letters IHS. These are the 'points' and 'figures' forbidden in the first book of Edward VI. In all ancient liturgical rites the consecrated host was broken before being consumed by the priest. In the Roman Church the celebrant, who uses at mass a larger host than that reserved for other communicants, first breaks it into two halves, and then from one half detaches a fragment which he drops into the chalice. In the Greek and other oriental churches, as well as in various Protestant communities, the eucharist is celebrated in leavened bread; and one of the grounds of separation from the West alleged by Michael Cerularius was the western practice of using unleavened bread. The use of unleavened bread is founded on the belief that Christ can only have used such bread when instituting the eucharist at the Paschal feast. Luther followed the Roman Church in this point, but did not break the host. It was decided by the Privy-council, in the Purchas case (1871), that the use of the wafer is forbidden in the Church of England. The elevation of the host is the act by which the priest immediately after pronouncing the words of consecration raises the host with both hands above his head, whilst the server tinkles his bell to call attention to the ceremony, that the congregation may adore Christ present.

Hostage, a person given to an enemy as a pledge for the proper fulfilment of treaty conditions. Formerly the evasion of the terms of the treaty by one of the contracting parties used to be regarded as entitling the enemy to put to death the hostages that had been given up to them. The shooting of Archbishop Darboy (q.v.) and his fellow hostages in 1871 was the most execrable crime of the Paris Communards.

Hostilius, TULLUS, the third of the legendary kings of Rome, succeeded Numa Pompilius in 670 B.C. He it was who made the famous arrangement by which the combat of the Horatii with the Curiatii decided the question of supremacy between Rome and Alba in favour of the former. He fought against Fidenæ and Veii, and conquered them; and destroyed Alba, and removed the inhabitants to Rome, giving them Mount Cælius to dwell on; and carried on war against the Sabines. At length the gods grew wrathful with him for his love of war and his neglect to worship them, and Jupiter Ellicius consumed him and his house with fire about 638 B.C. According to Niebuhr and Arnold, there are glimpses of a distinct personality in the legend of Hostilius, unlike those of Romulus and Numa, which are merely personifications of the two principal stages of a nation's growth.

Hotbed, a bed of fermenting vegetable matter, usually surmounted by a glazed frame, employed in gardening for cultivating melons and cucumbers, the rearing of tender annuals, propagating stove and greenhouse plants by cuttings, seeds, or grafting, forcing flowers, &c. It is an inexpensive means for obtaining a high temperature in a limited atmosphere, accompanied with genial humidity charged with nutritious gases, which is very beneficial to plants. Formerly it was an indispensable adjunct to the garden, but the almost universal employment of hot water as a heating agent for horticultural purposes has latterly greatly circum-

scribed its use. The materials used in making hotbeds are stable-dung, leaves—those of the oak and beech, being especially suitable, are frequently mixed with the dung—tanners' bark, spent hops, and the waste of jute, cotton, hemp, and flax, all of which must be allowed to pass through the first violent stages of fermentation in order to eliminate the deleterious gases they contain before being built up into the bed. The size of the bed is regulated by the degree of heat required for the purpose in view. A bed of stable-dung with or without leaves intermixed, four feet thick, will for some time after it is built maintain a temperature of from 75° to 90°, which is sufficient for most purposes. As the fermentation declines the bed cools down, but heat is again readily increased by adding fresh material to the sides of it. The bed should be made a few inches wider and longer than the frame that is to be placed upon it, and from 6 to 9 inches higher at the back than the front to secure a better angle for light. See also PLANT-HOUSE.

Hotchpot (the same word as *Hotch-potch* in the culinary sense), a phrase used in English law to denote that, where one child has already received an advancement out of the father's estate, that child must bring such portion into hotchpot before he will be allowed to share with the other children, under the statute of distributions, after the father's death. In other words, a child who has got money from the father to place him in business, &c., must treat that as a payment to account of his share at the father's death. The eldest son is not required to bring into hotchpot the land which he takes as heir. A similar, but not identical, doctrine exists in Scotland under the name of collation.

Hotch-potch, a Scottish dish, may be defined as broth in which green peas and vegetables take the place of barley or rice. *Hotch-potch* or *Hodge-podge* is a corruption of Middle English *hotch-pot*; Fr. *hochepot*; from *hocher*, 'to shake.'

Hot Cross Buns. See CROSS-BUNS.

Hotel (Fr. *hôtel*, Old Fr. *hostel*, Lat. *hospitale*), a superior kind of inn (see INN), like the old English *hostel*. The often palatial hotels that have sprung up since the introduction of railways are too well known to require notice. One point of difference between the European and the American systems is that under the former, except in the case of a *table d'hôte*, the charge is for each dish ordered, while under the American plan a fixed price is charged for every meal. The modern French word is still used for the house of a rich or distinguished man, or for a public building, such as the *Hôtel de Ville* (see MUNICIPAL ARCHITECTURE), as well as for inn or hostelry.

Hothouse. See PLANT-HOUSE.

Hot Springs, a city of Arkansas, 56 miles WSW. of Little Rock, is surrounded by fine mountain scenery, and is much frequented as a summer resort. It has over seventy thermal springs, ranging in temperature from 95° to 148° F. Hot Springs National Park was established in 1832. Pop. 11,700.

Hotspur, HARRY. See PERCY.

Hottentots, the people who were in possession of the greater part of what is now the Cape Province when it was first visited and colonised by Europeans. The Hottentots were so called by the earliest Dutch settlers, puzzled at their strange harsh faecal sounds and clicks, Hottentot or Hüttenütt signifying a stuttrer in Frisian or Low German. The terms Hottentots, Hottentots proper, and Cape Hottentots are often applied to the remnants of the tribes who formerly lived around

Cape Town; while the inhabitants of Griqualand West, of the South Kalahari, and of Great Namaqualand are distinguished by their tribal names as Griquas, Namaquas, Koras or Koranas, as if they were not as much Hottentots as the Khoikhoi of the Cape. The Hottentots are apparently not a separate or independent stock, but a cross between the Bushmen (q.v.) and Bantus with a Hamitic strain. The Hottentots, as distinguished from the Bushmen, call themselves Khoikhoi, and were originally nomads, and then many of them sheep-farmers. The Namaquas are the only branch that have kept their language and racial type comparatively pure; the Korana speech is much mixed with corrupt Dutch and English; but the great majority of those now classed loosely as Hottentots—near 100,000—are half-breeds, with a greater or smaller Dutch or Bantu element, and speak debased Dutch or English. Except the nomads, most Hottentots are now semi-civilised, and copy the habits, customs, dress, and vices of the European colonists. In general they are of medium height, not very robust in build, and have small hands and feet. Their skin is a pale brown colour; their hair woolly, growing in curly knots; their cheek-bones very prominent; and their chin pointed. The women are sometimes distinguished by certain organic peculiarities, and often have an enormous development of fat, especially in the breasts and hinderparts. Their principal characteristics in former days were indolence and hospitality. Their favourite amusements were feasting, dancing, smoking, and singing. The men were herdsmen, and not fond of war, though they liked to hunt. The women, although held in high esteem, performed all the manual labour. Their dwellings were huts of wood and mats, or tents, disposed in circles, and easily transportable. Their manner of living was entirely patriarchal: each tribe or division of a tribe had its own chief. Their method of perpetuating family names was that the sons took their mother's family name, whilst the daughters took their father's.

Their language embraced three principal dialects—the Nama, spoken by the Namaquas; the Korana, spoken by the Koranas; and the Cape dialect, now almost, if not entirely, extinct. Owing to its use of suffixes for expressing the declensions of nouns and the conjugations of verbs, the Hottentot language was classed by Bleek, Lepsius, and other scholars with the Hamitic family of speech. This view was, however, controverted by Fr. Müller, Hahn, and Von Gabelentz, who maintained that the Hottentots and Bushmen are allied peoples, the aboriginal inhabitants of the greater part of South Africa. The linguistic association of the Bushmen with the Hottentots rests upon little more than the common possession of a few verbal roots and the common use of some harsh faecal sounds or 'clicks' in their manner of speech. These 'clicks' are four in number—a dental sound, usually represented by the sign |; a palatal, by #; a lateral, by ||; and a cerebral, by !. All the Khoikhoi idioms are distinguished by monosyllabic roots ending in a vowel, and the use of pronominal elements as suffixes for the purpose of forming derivatives. They possess no prefixes. One striking feature is a decimal system of counting.

They have both sacred and profane poetry, and hymns of both kinds are sung accompanied by the so-called reed-music or reed-dances, performed on reed or bark pipes. The sacred hymns are generally prayers, invocations, and songs of praise in honour of the supreme being Tsüligoab, the beneficent deity Heitsi-eibib, and the Moon; while the profane reed-songs or dances deplore the fate of some dead chief or hero, or are sarcastic lessons to some one who has done something unpopular.

They are often given by way of welcome to some guest worthy of honour, and in every large kraal there is a bandmaster, whose business it is to drill the young boys and girls in this music. Dr Hahn compares its effect to the harmonium. The chief divinities of the Khoikhoi, as has been seen, are the supreme being Tsüilgoab, who lives in the Red Sky; another beneficent being, Heitsi-eibib, considered as an ancestral deity, who came originally from the East; and ||Gaunab, an evil spirit, whose malignant influence has to be averted by prayers and charms, which furnish employment to troops of professional sorcerers. The mythology is rich, but singularly confused and difficult of interpretation. It contains also repulsive features enough, but not more so than the old Greek. Much more might have been known had well-meaning missionaries been more sympathetic or intelligent. Beyond the hymns spoken of, the popular imagination has originated, or at least retained, a great number of fables, as well as legends, proverbs, and riddles. One persistent feature in these is a strong inclination to personifications of impersonal beings. Speech and reason are freely imputed to the lower animals, and human-like agencies employed freely as causes of celestial and other natural phenomena. The first to give examples of these was Sir James Alexander in his *Expedition of Discovery into the Interior of Africa* (2 vols. 1838). More were brought to light by Krönlein and others, and in 1864 Dr W. H. I. Bleek gave a good selection in his *Reynard the Fox in South Africa: Hottentot Fables and Tales*.

For the language, see the grammars by Tindall (1871), Hahn (1870), Fr. Müller (*Grundriss der Sprachwissenschaft*, vol. ii. 1877), and Bleek (1862-69). For the people, see Dr Gustav Fritsch, *Die Eingeborenen Süd-Afrikas* (1872); Dr T. Hahn's *Tsünilgoam: the Supreme Being of the Khoi-Khoi* (1882); and Dr Theal's *The Yellow and Dark Skinned Races of Africa South of the Zambesi* (1911).

Hottentot's Bread, or ELEPHANT'S FOOT (*Tesudinaria elephantipes*), a plant of the yam order (Dioscoreaceae), of which the root-stock forms a large fleshy mass, curiously truncate, or somewhat resembling an elephant's foot, and covered with a soft, corky, rough, and cracked bark, recalling the shell of a tortoise, whence its other name. From this springs annually a climbing stem, which bears the leaves and flowers. The starchy root-stock is used as food by the Hottentots. The plant is not unfrequent in hot-houses. A few species are North American. See DIOSCOREACEÆ.

Hottonia. See WATER-VIOLET.

Houdin, ROBERT (1805-71). See CONJURING.

Houdon, JEAN-ANTOINE, the greatest French sculptor of the 18th century, was born at Versailles, 20th March 1741. He was of humble origin, his father holding office in a nobleman's house. He was a born sculptor, and at the age of thirteen had already attracted notice. An untrammelled eclecticism was ever Houdon's most prominent characteristic. In 1761, when he was but twenty, he won the *prix de Rome*, and in Rome he threw himself with enthusiasm into the study of the antique. Herculaneum and Pompeii had not long been brought to light. All Winckelmann's works were published during Houdon's sojourn in Italy. Ten years he remained in Rome, and there executed the colossal figure of St Bruno, the founder of the order of the Chartreuse, of which Pope Clement XIV. said that it would speak did not the rules of its order enforce silence. On his return to France the usual official honours were conferred upon him. In 1777 he was received into the Academy; in 1796 he was elected member of the Institute; and he was

appointed professor at the École des Beaux-arts in 1805. Apart from his work his life was singularly uneventful, though he once visited America under the escort of Franklin, to execute a monument in honour of Washington (1785). Nor did he altogether escape from the troubles of the Revolution. An allegorical figure from his hand, entitled 'Sainte Scholastique,' involved him in the heinous charge of desiring to perpetuate the worship of the saints. But on pleading that his statue only represented Philosophy, he was acquitted. Towards the end of his life his intellect failed him, and death came as a release, 16th July 1828. Houdon is perhaps the most conspicuous figure among the artists of his time. His mastery over his material was complete. So great were his technical skill and adroitness that they sometimes carried him beyond the bounds of his art. He had essayed all styles without sacrificing his personality, and, while much of his work has an almost classical simplicity, it was generally his method (in portraiture at least) to obtain a resemblance by an infinitude of details. It is a little strange that his 'Écorché' should be the most widely known of his works. For it was in portraiture that his greatest triumphs were achieved. Turgot, Rousseau, Voltaire, Diderot, Franklin, Washington, Lafayette, Mirabeau, Napoleon, and Mdlle. Arnauld are a few of the great men and women whose features he has perpetuated for us. In 1890 a statue of him was erected at Versailles. See his *Life and Works* by Hart and Biddle (1911).

Houghton, RICHARD MONCKTON MILNES, LORD, was born of a good old Yorkshire family of Fryston Hall, Pontefract, 19th June 1809. His father, 'single-speech Milnes' (1784-1858), of Fryston, Bawtry, and Great Houghton, declined the chancellorship of the exchequer and a peerage; his mother was a daughter of the fourth Lord Galway. Educated by private tutors at home and in Italy, he went up to Trinity College, Cambridge, where he graduated M.A. in 1831, and where he was a leader in the Union (then 'cavernous, cavernous'), and one of the famous band of 'Apostles.' From 1837 till 1863 he represented Pontefract, first as a Conservative, but latterly as an independent Liberal; and then he was called by Lord Palmerston to the Upper House, of which for a score of years he was 'the only poet.' In 1851 he married a daughter of the second Lord Crewe. She died in 1874; and he himself, having three years before had a passing attack of paralysis, died suddenly at Vichy, 11th August 1885. A Mæcenas of poets (and of poetasters), he got Lord Tennyson the laureateship, soothed the dying hours of poor David Gray, and was one of the first to recognise Mr Swinburne's genius. His own poetry is always respectable, and some of the shorter pieces were in their day exceedingly popular—'Strangers Yet,' for example, and the pretty lyric whose refrain is 'The beating of my own heart Was the only sound I heard.' Besides this, Lord Houghton—the 'Mr Vavasour' of Beaconsfield's *Tancred*—was a traveller, a philanthropist, an unrivalled after-dinner speaker, and Rogers' successor in the art of breakfast-giving. He went up in a balloon, and down in a diving-bell; he was the first publishing Englishman who gained access to the harems of the East; he championed oppressed nationalities, liberty of conscience, fugitive slaves, and the rights of women; he carried a bill for establishing reformatories (1846); and he counted among his friends Hallam, Tennyson, Thackeray, Dickens, Carlyle, Sydney Smith, Landor, Cardinal Wiseman, Heine, Thirlwall, and a host of others. See CREWE.

Lord Houghton's works include *Memorials of a Tour in Greece* (1833); *Poems of many Years* (1838); *Memorials of a Residence on the Continent* (1838); *Poetry for the People* (1840); *Memorials of many Scenes* (1843); *Palm*

Leaves (1844); *Life, Letters, and Remains of Keats* (2 vols. 1848); *Good Night and Good Morning* (1859); *Monographs, Personal and Social* (1873); and *Collected Poetical Works* (2 vols. 1876). See an article by T. H. S. Escott in the *Fortnightly* for September 1885, and the *Life* by Wemyss-Reid (2 vols. 1890).

Houghton, WILLIAM STANLEY (1881-1913), playwright, born at Manchester and educated at the grammar-school there, became a cotton-broker and dramatic critic. His play *Hindle Wakes* aroused hopes of a brilliant career, which were dashed next year by his death. His works were edited by Harold Brighouse (3 vols. 1914).

Houghton-le-Spring, a town in the county, and $6\frac{1}{2}$ miles N.E. of the city, of Durham. Its rapid growth is mainly due to the extension of neighbouring collieries. The fine cruciform parish church contains the cinque-cento altar tomb of Bernard Gilpin (q.v.), who founded a grammar-school here, and among whose successors were Peter Heylin and Archbishop Sancroft. Pop. 10,000.

Hound, a name applied to dogs used in hunting. The true hounds, such as the Bloodhound, the Foxhound, and the Staghound, hunt only by scent. In this division may also be included the Basset-hound (a short-legged dog used in unearthing foxes and badgers), the Beagle, and the Harrier. The greyhound and the deerhound run by sight alone, and are not hounds in the correct acceptance of the term. See also FOX-HUNTING.

Hound's-tongue (*Cynoglossum*), a genus of plants of the natural order Boraginæ, of which there are many species, all of a coarse appearance, with small flowers. The Common Hound's-tongue (*C. officinale*) is a native of Europe, Asia, Africa, and North America; not uncommon in some parts of Britain, especially near the sea-coast. It has soft downy leaves, of a dull green colour, purplish-red flowers, and a stem about two feet high.

Hound's-tongue (*Cynoglossum officinale*).

Its odour is very disagreeable. The root was formerly administered in scrofula, dysentery, &c., and is said to be anodyne. It is also one of the pretended specifics for serpent-bites and hydrophobia.

Hounslow, a town of Middlesex, 10 miles W. by S. from London by road, was formerly a place of much importance in the old coaching days, it being the first stage out of London on the Bath and Southampton roads. As many as 800 horses were then maintained here, 500 coaches passed through

daily, whilst a most extensive business in posting was carried on. With the opening of the railways, however, the place gradually declined, and at the present time it contains but little of interest. Its three churches are all modern, the oldest, rebuilt in 1835, having been formerly the chapel of a priory. West from Hounslow, stretching for 5 miles along the road, and in 1546 containing an area of 4293 acres, was Hounslow Heath, the scene of many military encampments, and notorious in the annals of highway robbery. It is now for the most part enclosed. Near to the town are extensive gunpowder-mills and cavalry and militia barracks, and at Kneller Hall, once the residence of Sir G. Kneller, the painter, are the quarters of the Royal Military School of Music. Hounslow now forms two wards (Hounslow, North and South) of the urban district of Heston and Isleworth.

Hour, a measure of time equal to $\frac{1}{24}$ th part of an astronomical day or to $\frac{1}{24}$ th part of a natural day (excluding the hours of night or darkness). See DAY, and TIME; and for the hours in Catholic usage, see BREVIARY.—*Hour-circles*, in astronomy, are any great circles which cut the poles.

Hour-glass, an instrument for measuring intervals of time. It is made of glass, and consists of two bulbs united by a narrow neck; one of the bulbs is nearly filled with dry sand, fine enough to run freely through the orifice in the neck, and the quantity of sand is just as much as can run through the orifice in an hour, if the instrument is to be an hour-glass; in a minute, if a minute-glass, &c. The obvious defects of this instrument are the expansion or contraction of the orifice produced by heat or cold, and the variations in the dryness of the sand, all of which produce deviations from the true measurement of the time. The hour-glass was almost universally employed in churches during the 16th and 17th centuries. In several of the churches in England hour-glass stands of elegant workmanship are still to be seen.

Houri, the name of the beautiful damsels who, according to the Moslem faith, await with their companionship in Paradise the true believers after death. See MOHAMMEDANISM.

Housatonic River rises in Massachusetts, flows through Connecticut, and enters Long Island Sound near Bridgeport. In its course of nearly 150 miles it affords water-power to many manufacturing villages.

House, in point of law, is an Englishman's castle, though not a Scotsman's. In other words, when a man shuts himself up in his own house no bailiff can break open the door to arrest him, or seize his goods for debt, in England, and no court can give such power, except in the case of a writ of attachment for contempt of court or a writ of *habere facias possessionem* (the writ by which a judgment for the recovery of land is commonly enforced). In Scotland leave can be got from the court, or under signet letters, where no warrant is possessed already, to enable the messenger to break open the outer door and arrest. In England, though it is not competent for the bailiff to break open the outer door by force, yet every trick* or stratagem is fair in order to effect a peaceable entry, and once in he cannot be turned out. Where the party is charged with a criminal offence a constable armed with a warrant, or in some cases without, is entitled to break into the house and arrest him, both in England and Scotland. A man is entitled also to defend his house against trespassers and thieves, using no greater force than is necessary; and if necessary in that sense, he may even kill the intruder, though very strong circumstances are required to justify this. He may also

put spring-guns on the premises; but by doing so he may render himself liable to an action if any person lawfully entering the premises should be injured. In Scotland a peculiar name is given to the offence of feloniously assaulting a man in his own house, called *Hamesucken* (q.v.), a name also used in the old law of England; and all offences committed in another person's house are generally punished more severely than those not committed in a house at all. See also **EVICTON**.

House-boat. See **BARGE**.

Housebote. See **ESTOVER**.

Housebreaking is the breaking and entering another person's dwelling-house, shop, warehouse, &c., with intent to commit a felony therein. It is identical with Burglary (q.v.) so far as concerns the breaking, the entry, and the intention that it requires. The more important points in which it differs from burglary are these: (1) It is not limited to any particular hours. In an indictment for burglary it must be alleged that the offence was committed in the night; but an indictment for housebreaking does not contain any allegation as to the hour of the offence. (2) It extends not merely to dwelling-houses, but to shops, warehouses, school-houses, counting-houses, garages, and other buildings enumerated in the Larceny Act, 1916 (6 and 7 Geo. V. chap. 50), sect. 26. Under that act it is punishable with penal servitude for fourteen years if any ulterior felony is actually committed, but only for seven years where nothing more is proved than that the breaking and entering were done with the intent to commit a felony.

In Scotland housebreaking is committed by breaking into any roofed building so fastened as to show that it is relied on for the protection of property, or into any part of a building used as a separate dwelling. Where any article is stolen from the building by a person so entering, the housebreaking is an aggravation of the theft. Further, it is a crime to break into a house, or to attempt to break into a house, for the purpose of committing a theft, although nothing may be actually stolen.

Houseburning. See **ARSON**.

House-fly (*Musca domestica*), perhaps the most familiar and widely distributed dipterous insect. Adults are to be seen the whole year round, though naturally most numerous in summer. They feed

indiscriminatingly on whatever they can suck up through their fleshy proboscis or scrape off with their other mouth parts. The female fly lays about 120-150 eggs at a time, and may lay six batches during its life. In warm stables and the like breeding may go on all through the year. The eggs are deposited in decaying organic matter, in dung, or in any filth, and the larvæ are hatched in a day, or even less if the weather be warm. These larvæ are smooth, naked maggots, without legs or distinct head, with small hooklets at the mouth, and

Fig. 1.

a, larva of house-fly, with breathing pores at tail (lower) end; b, young fly emerging from pupa sheath.

a length of about one-third of an inch. They feed on organic debris, move by contracting the abdomen, and grow for about a week. Then they seek some dry resting-place, undergo pupation, and finally in a few days (three may suffice) become

winged insects. They may begin to lay about a fortnight after emergence from the pupa sheath. In warm weather the whole development has been known to occur in eight days, but it may take nearly a month. Most house-flies die off when the cold weather comes, but a few hibernate—often crowded together—in dark places.

The house-fly is often found outside houses. In country-houses *Stomoxys calcitrans*, which is not a house-fly in the strict sense, is often predominant.

Fig. 2.

A, head of house-fly: a, compound eye; b, antenna; d, maxillary palps; e, f, proboscis; g, labellæ, lips of proboscis; h, opening into proboscis; i, thorax, with breathing pore (after Von Hayek). B, end of a fly's foot highly magnified, showing long hairs, two terminal claws, and two membranous adhesive pads.

The lesser house-fly, *Hamalomyia canicularis*, is often abundant in sitting-rooms. Though house-flies do not bite, they are often extremely troublesome. Expedients for killing them off require no advertisement. It is more important to notice that house-flies are sometimes responsible for disseminating disease-germs, such as that of typhoid fever. See C. G. Hewitt's *The House Fly* (Cambridge).

Household, THE KING'S OR QUEEN'S, in Great Britain comprises the departments of the Lord Steward (q.v.), the Lord Chamberlain (q.v.), the Master of the Horse (q.v.), with the Lords of the Bedchamber, the Royal Almonry, and the department of the Mistress of the Robes, which comprises the Ladies of the Bedchamber, the Bedchamber Women, and the Maids of Honour. For the Lords and Ladies of the Bedchamber, see **BEDCHAMBER** (see also **ROYAL FAMILY**). The *Maids of Honour*, of whom there are eight, are immediate attendants on the royal person, and in rotation perform the duty of accompanying the Queen on all occasions. They enjoy by courtesy the title 'Honourable' when not entitled to it by birth, and are then designated the 'Honourable Miss —' without the Christian name.

Household Troops are those troops whose especial duty it is to attend the sovereign and to guard the metropolis. These forces comprise regiments of Household Cavalry—the 1st and 2d Life Guards and the Royal Horse Guards; and regiments of Foot Guards (see **GUARDS**).

House-leek (*Sempervivum*), a genus of plants of the natural order Crassulaceæ, having a calyx of six to twenty sepals, the petals equal in number to the sepals, and inserted into the base of the calyx; the leaves generally very succulent, and forming close rosettes. The Common House-leek or Cyphel (*S. tectorum*), called *Fous* or *Fouets* in Scotland, and in some countries *Jupiter's Beard*, grows wild on the rocks of the Alps, but has long been common in almost every part of Europe, planted on walls, roofs of cottages, &c. It sends up leafy flowering stems of 6 to 12 inches in height,

bearing branches of pale red equally curious and beautiful.

Common House-leek
(*Sempervivum tectorum*).

star-like flowers. The leaves cut or bruised and applied to burns afford immediate relief, as they do also to stings by bees or wasps; they are beneficial when applied to ulcers and inflamed sores, and were formerly esteemed a remedy for fevers and other diseases. *S. soboliferum*, with yellowish-green flowers, is planted on walls in Germany. Some of the species are shrubby; others are common greenhouse plants.

Housemaid's Knee

is the term commonly applied to an acute or chronic inflammation of the bursa or sac that intervenes between the patella, or knee-pan, and the skin. Housemaids are especially liable to it from their kneeling on hard damp stones. In its acute form it causes considerable pain, swelling, and febrile disturbance. The only disease for which it can be mistaken is inflammation of the synovial membrane lining the cavity of the joint; but in this disease the patella is thrown forwards, and the swelling is at the sides, while in housemaid's knee the swelling is very superficial, and is in front of the patella. The treatment in the acute form consists essentially in the means usually employed to combat inflammation—rest in bed, fomentations, and purgatives; if suppuration take place the sac must be freely opened and the pus evacuated. The chronic form may subside under rest, blisters, &c., or it may require incision or excision for its cure.

House of Commons. See PARLIAMENT.

Housing and Town-planning. HOUSING and TOWN-PLANNING are names for two separate groups of problems; but, in all the recoverable history of civilisation, these problems have been intermixed. It is, therefore, convenient to take housing and town-planning together. Very early in civilisation group-housing was necessary, for in the great human march towards the food-producing areas of the world the tribe was the principal unit, and the tribe meant group-housing. Whether, therefore, we contemplate the early tribes of Europe, as, for example, Cæsar found them in Gaul, or the later and closer integrations of communities established in the early middle ages, and increased as industrialism proceeded, the housing problem and the town-planning problem constantly merge into each other. The individual houses of the food-producing areas become townships, the townships become villages, the villages become organised towns, the towns become cities. Accordingly, town-planning of a kind early became necessary if the health of the social group was to be maintained. Naturally, the first great cities appeared in the world-centre where civilisation had furthest developed—Babylon, Nineveh, Jerusalem, Constantinople. In all these definite plans were recognisable, just as they are in modern cities. But in the ancient world the

cities were essentially cities of a tribe, and Athens and Sparta were the city-states of Athenians and Spartans. Each city-state had to maintain itself against its neighbours. That fact largely determined the city-plan. In the history of Greece we repeatedly find that the greatest benefaction a statesman could confer on the city was to keep in repair the city wall. Within the last two thousand years all the great cities of Europe have been walled cities. Functionally, the walls have long ceased to be a protection; they have largely become an ornament. But as one passes from city to city one finds that the plan of a city is always largely determined by the necessities of war.

Town-planning in Antiquity.—To take one or two examples from the ancient world. In Egypt, towns had to be built on an artificial foundation; hence low houses, spread over a large area. In Babylon, probably a group of communities had to be housed within one wall, and the city must be large enough to include pasture land and fields in case of siege. In Greece, the large towns were really city-states. Athens had great public buildings contrasted with very plain dwelling-houses. But, even in Athens, the streets were narrow and twisted; but the Athens of Pericles was developed not merely to suit the purposes of defence, but, by every device of architecture and grouping, to preserve to the city population the consciousness of a great civic unity. In the mind of Pericles the city was definitely conceived as a place where the Athenian people could develop their ideals of security, use, health, and beauty. Nothing less than this can be inferred from Pericles's funeral oration in Thucydides. The Periclean ideal was to house the Athenian democracy in a city as varied in its beauty as the Athenian mind was fertile in great ideas.

Rome, in the days of Julius Cæsar, was already a great city-state. Its plan was determined largely by the seven hills, which to this day more or less affect the city's growth. The upper classes had fine palaces; the lower classes had rather poor houses; but, in a Mediterranean climate, one leading necessity is to protect the eyes from too much light; hence—few windows, many recesses, open courts, dark archways. But, as the remains of ancient Rome show, there was very definite design in the centralising of the great law courts, the temples, and other public buildings in the Forum. The aqueducts prove the great skill put to the engineering of water-supplies; the Cloaca Maxima, though to-day it would be counted bad engineering, exists to show how Rome realised the problem of waste and cleansing. But in modern Rome, as in ancient Rome, one great principle of town-planning was realised superbly: the Capitol and its temples, no less than the Palatine and its palaces, dominate the whole city. In the modern world every town-planner thinks of the 'civic centre' among his first problems.

Town-planning in the Middle Ages.—Among the mediæval cities of Europe there are many admirable examples where the principles of town-planning were consciously applied. 'In the thirteenth century no less than fifty towns were founded by the English in Aquitaine and Guienne within the same number of years, all of which were laid out, wherever practicable, upon a definite system, and formed an essential part of the wise and far-sighted policy of Edward I.' (Triggs, *Town-planning*, p. 77). The main objects were to centralise the inhabitants of the regions, and to provide for the exchange of goods. Naturally, the market-places of the towns became important civic centres. Edward, it is stated, on one occasion wrote from Bordeaux to London asking for experts skilled in the laying-out

of town-plans—'the most able and skilful of those who best know how to divide, order, and arrange a new town in the manner that would be most beneficial to us and to the merchants' (*op. cit.*, p. 78). Among the German mediæval cities, Nürnberg and Rothenburg are admirable examples of town-planning, adapted to the main purposes of cities in the 13th century, namely, defence and commercial enterprise. To this hour old Nürnberg, as might be expected from the city of Albrecht Dürer, is a mine of suggestion to the artistic architect of individual houses as well as to the planner of cities.

Modern Town-planning.—But, for the study of modern town-planning proper, we need go no farther back than modern Paris, as reconstructed under the third empire. 'To Paris belongs the honour of having been the unrivalled leader in European cities in effectually transforming the labyrinthine tangle of narrow mediæval streets into broad modern thoroughfares. Vienna and Berlin have also accomplished magnificent results in city-making, but Paris was the pioneer, and her municipal authorities, acting under the guidance of Baron Haussmann, were the first to conceive the ideas of symmetry and spaciousness, of order and convenience, that have made Paris the finest city in the world' (*op. cit.*, p. 33). Here are some leading features of the town-plan: the exploitation of the Tuileries Palace, to serve in the splendid vista that includes the Champs Élysées and stretches to the Place de l'Étoile, itself a circle, with twelve fine streets or avenues issuing as rays of the star; long boulevards on the north and south of the river, following, in part at least, the lines of old fortifications, but now serving as thoroughfares for the great lines of traffic; carefully designed approaches to great public buildings like the Madeleine, the Opéra House, the Luxembourg, and a hundred others; special designs of the great places like the Place de la Concorde, the Place de la Bastille, and their hundreds of variants; the creation of open spaces to prevent the congestion of many converging streets; the studied variety in the treatment of street corners and converging street masses; the regulation of street widths to suit heavy traffic, light traffic, foot passengers, &c.; the adjustment of public parks, gardens, and bridges to emphasise the artistic values of surrounding streets and buildings; the systematic application of the three leading principles of town-planning, namely, use, safety, and beauty. Wherever one goes in modern Paris, one is struck with the beautiful proportions of street and building, and the innumerable picturesque effects resulting from careful town-planning. There are, it is true, multitudes of narrow streets where the housing is far from good; the tenement system rides over everything; but, with all drawbacks, the Haussmann plan of modern Paris has conveyed innumerable ideas to the town-planners of the world. Perhaps the most striking effect is the wonderful use made of the river Seine and its banks, which from one end of Paris to the other constitute an integral part of the city structure. It is important to remember that the modern Paris comes not before, but after, the industrial revolution; and, as a primary part of modern town-planning is to undo the hurriedly planned cities resulting from that revolution, Paris is in a special sense a pioneer. Incidentally, it illustrates among other important points the economics of town-planning. The immense sums spent on the reconstructed Paris have probably been repaid many times over.

General Principles of Town-planning.—When town-planning became better understood, the principles followed in the great cities like Paris, Berlin, Vienna, Budapest, and many other capitals as well as in mediæval cities, were made

explicit in statutes and regulations. Thus, in the German act of 1875, one clause enunciates a fundamental principle of a good town-plan: 'In the setting up of building lines regard must be had to the improvement of traffic, safety from fire, public health, and the preservation of streets and buildings from disfigurement. It is, therefore, necessary to provide for sufficient width of street, and a good connection of the new building areas with the areas already existing.' Traffic, safety, health, amenity—these are the four governing principles of all good town-plans.

But the establishing of a town-plan on a virgin area involves negotiations with the owners for the concession of certain conditions. These concessions are governed by law. For example, every area to be built on by an owner must surrender a certain amount for street purposes. The proportion varies for the different types of street. For amounts beyond this, compensation may be required. All land properties are entered on the town-plan and in the town register. In the development of virgin areas the problem is relatively simple; but in the older areas, as in the heart of Frankfurt, the complications of small properties are enormous. But all these have to be adjusted by legal process. The town-plan has to pass through various stages of approval, from its first submission in a relatively skeleton form to its ultimate approval by the ministry concerned, and, once approved, after full discussion and hearing of parties interested, the plan becomes for a period of years the expressed condition of all new or altered buildings. There is, of course, provision for alterations duly investigated and approved.

These principles have been fully tested in all the great cities of Europe. In the Housing and Town-Planning Act of 1909 the main principles were imported into British legislation. But housing and town-planning remain to a greater extent than on the Continent separate. This is an historical incident. As time goes on, the town-plan of every city will be the basis of all arrangement of housing and traffic in streets. Meanwhile, any British city, when it wishes to reorganise an old area or develop a new area, may proceed by four methods: it may produce an improvement scheme, where compensation is governed by certain rules; it may produce a reconstruction scheme, where certain other rules are applied; it may produce a building scheme, where the municipality may itself provide the working-class dwellings; it may produce a town-planning scheme, where the conditions of future streets and types of houses are laid down with due provision for compensation to the owner for property taken, or contribution by him on account of betterment. The first three methods are essentially methods of housing or re-housing; the fourth method is essentially a method of city development. But the town-planning clauses of the act apply only 'to any land which is in course of development, or appears to be likely to be used for building purposes, with the general object of securing proper sanitary conditions, amenity, and convenience in connection with the laying out and the use of the land and of any neighbouring lands.' The local authority must have the sanction of the Ministry of Health in England, or the Scottish Board of Health in Scotland, before it can proceed with the preparation of a plan. The authority must satisfy the ministry or the board that there is a *prima facie* case for making a scheme. When the preparation is sanctioned the ground is surveyed, and ultimately the town-plan is submitted for the approval of the ministry or the board. After the necessary inquiries, which, on account of the intricate property questions involved, are necessarily

prolonged and difficult, the plan is approved or modified by the ministry or the board, and thereafter the local authority proceeds with the laying out of the area, providing roads, sewers, water-supply, &c., in the parts likely to be early developed. The preparation of a plan involves highly skilled work by architects, engineers, and experts in town-planning. Endless questions of legal rights arise; but the broad effect is that properties built within the plan, once approved, are not likely to be affected by freakish intrusions of inferior building. Further, fabulous amounts have been spent in clearing out over-built slum areas that might never have existed if adequate attention had been given to town-planning. In order to allow for rapid changes in commercial conditions, the town-plan first prepared is usually a skeleton plan of main arterial roads, with indications of probable types of building.

Here it is important to record that, in the opinion of Professor Eberstadt, there tends to be a conflict between housing and town-planning; where the town-plan is the predominant consideration, individual houses tend to be less satisfactory. Part of the problem is to reconcile the claims of first-class individual housing with fine street effects, and, naturally, there is a danger of sacrificing the house to the street. But, as Patrick Geddes has for years pointed out, each locality has its own peculiar genius, and no town-plan can ultimately satisfy unless it takes account of that genius. The ancient part of Edinburgh has its own peculiar picturesqueness, which nothing can touch; but the primary conditions of ancient High Street and Canongate were determined largely by the necessities of defence and the difficulties of procuring land. When the splendid expansions of modern Edinburgh began, there were other difficulties; the planners of the north side would not to-day repeat what the planners of a century ago did; but, none the less, the splendid spaces and groupings still attract the whole world, and the losses of many of the original builders have become the immeasurable gains of the city of Edinburgh.

Mechanism of Town-planning.—The comprehensive town-plan of a modern city must take account of the following elements: streets, transit and transport of people, transport of goods, factories and warehouses, food-supply and markets, water-supply and sanitation, housing, recreation, parks, architecture, laws, and finance (Lewis, *Planning of the Modern City*, p. 47). Each of these is a special problem. Manifestly, the town-planner must work by some general principle in determining the width of streets and the connection of streets. He must provide for main arterial lines of traffic. This demands streets capable of accommodating tramways or other systems of transport, roadways for heavy traffic and light traffic, two streams each way. The London Traffic Commission recommend the following widths of street: main avenues, 140 feet; first-class arterial streets, 100 feet; second-class streets, 80 feet; third-class streets, 50 feet; fourth-class streets, 40 or 50 feet; the width to include footways on both sides, and no street to be less than 40 feet wide. These figures are not arbitrary; they are based on experience. In the dwelling-house areas of the city the streets may be shorter, more lightly paved, and wide enough only to afford sufficient light and air for their type of house. Any large city exhibits these differences. The following are the widths of some famous streets: Avenue des Champs Élysées, Paris, 230 feet; Unter den Linden, Berlin, 190 feet; Ring-Strasse, Vienna, 185 feet; Whitehall, 120-145 feet; Victoria Embankment, 120 feet; Holborn Viaduct, 90 feet; Oxford Street, 64 feet; Princes Street and George

Street, Edinburgh, 100 feet. But very wide streets mean more service for cleansing and maintenance; very narrow streets mean unwholesomeness. The streets of each locality within a city should be determined specially, but the minimum is limited by the need for light and air.

Transport.—In the large modern cities transport of passengers has become a primary problem, for the worker must either be near his work or be provided with rapid transport. This has led to a large development of tramways, buses, and suburban trains. All these in turn require special types of road, rail, and access. The great railway stations become a problem in architecture as well as in town-planning.

Relation of City and Surroundings.—The relation between the city and the surrounding rural areas is a vital relation. In the old cities certain main roads had existed from time immemorial, and these now serve the double purpose of street within the city and roadway without, and the town-planner must take account of both functions. But increase in the width of street is not the only method of accommodating transport of people or traffic. The larger cities have been compelled to relieve the streets by the erection of underground railways; New York requires both underground and elevated railways. Since the advent of electricity and petrol as motor forces, the speed of vehicles and the resulting traffic congestions constitute a new problem.

Inter-relation of Streets.—More and more is it necessary to think out not merely the width of the streets, but their relations to one another. In former ages the simplest design was the 'gridiron,' which was the system adopted for New York, Philadelphia, and many other American cities, as well as for many European towns. The essence of this geometrical plan is—broad avenues, intersected at right angles by narrower streets of given length. On paper, the plan is simple; in practice, New York has found it very inconvenient in many respects.

In the large continental cities the relation of streets has been solved in other ways. For instance, in Cologne the old fortifications of the city were taken down and converted into a splendid ring street. Probably the most striking example is the great Ring Street of Vienna. This city illustrates so well the modern methods of town-planning that some more detail is justifiable here. In the municipal museum there, one can see models of the city from the days when it was a mere Roman settlement in the 4th century to the present day. The greater part of Vienna lies in a plain on the south bank of the Danube. The small Vienna River passes through, and there is a Danube Canal suited for small ship traffic. When the last city wall ceased to be of value from a military standpoint, it was handed to the municipality. The wall was taken down, and the magnificent Ring Street, nearly 200 feet broad, took its place. On this street appear the finest public buildings—the great natural history museum, the national gallery, the Palace of Justice, the Opera House, the Reichsrats-Gebäude (Houses of Parliament), the municipal buildings, the votive church, the Vienna University, the State Theatre, and many others. This ring street has double car lines, riding courses, walking courses, heavy and light traffic course, and broad pavements. As the sites were of great value, the public buildings have a response in the large hotels. From the centre of the city across this ring street radiate out many of the principal streets of Vienna, connecting the city with the whole circle of country around. At a certain distance away there is another circle, though not so manifestly a ring street; but it serves the same purpose—namely, it acts as a main traffic and

business street. Recently there was added a third ring, known as the Wald-und-Wiese Guertel (the Wood and Meadow Girdle), which includes some fine hills to the west and south, and large forest lands. By special parliamentary sanction, the forest land for some five miles beyond this girdle could not be treated without the sanction of Vienna. At the date of this expansion Vienna had about 1,500,000 inhabitants, and the expansion provided room for at least half a century in advance. The method of planning was simple; the new area was first carefully contoured, a model being made of the various hill and other regions; these regions were carefully photographed, and, along the ridges where the outlook would be most picturesque, a main road was planned, provision being made for placing the city cemeteries in spots removed from housing; for the building of large villas; for the establishing of restaurants, and the many other picturesque developments incidental to such a city. Within the built city itself can be seen innumerable solutions of the high tenement block system of streets; special treatment of open spaces, bevelled corners, deliberately designed small squares or circles or triangles, all designed to smooth out the ugliness of abrupt corners and unadjusted crossings, as well as to simplify street traffic and facilitate its control. In this vast city, in every corner of which there are indications of foresight and design, the public parks and gardens are an important element. The municipal buildings constitute a splendid Gothic block, with four quadrangles and a traffic passage through the centre. It dominates the Reichstag buildings on the one wing and the votive church and the university on the other, and is a worthy response to the State Theatre, which lies on the opposite side of the Ring Street, the whole area being so adjusted that all the buildings shall have their full proportional scenic effect. These modern developments were, of course, conditioned by the old existing city; but there are steady improvements in the lines of traffic and building lines generally. One proof of the good planning is that a stranger can master the main routes of the city in an hour or two.

Method of Zones.—In many cities, for example Düsseldorf, the town-plan is mapped into special zones. Within each zone only certain types of building can be erected. Thus, in one zone, only three-story tenements are allowed; in others, five-story; in others, only villas. Special areas are assigned to factories with certain heights of chimney; others, to minor factories producing less smoke. This is exceptionally well thought out in Dresden, where every effort is made, by selection of sites, so to place the smoke-producing areas that the prevailing winds will not flood the residential quarters with smoke. In Charlottenburg there is a sand-dust problem of the same sort, and the direction of the residential streets is deliberately arranged to protect them as far as possible from the sand-storms. Similarly, in Düsseldorf, certain streets are protected from the westerly gales. In the pleasure towns, like Wiesbaden, one sees the value of excluding the smoke-producing factories from certain areas within the city. It might be said that this zone system involves excess of regulation. There is that possibility; but the system has to be tested by the actual results, which, as a rule, are excellent.

Many other points might be elaborated did space permit—for instance, the use of trees as a street decoration. In Dresden the town-planning goes definitely on the principle that, as all houses cannot have a garden, open spaces and trees should be so adjusted that every dweller in a street will, immediately on emerging from the house, have some tree or shrub or green grass to rest his eye

upon. This is not universally practicable; but tree-planting in streets has been elaborated into a special system of gardening, and the results in the continental cities leave no doubt as to the adequacy of the methods.

Finance.—The finance of town-planning differs in every city. In towns like Frankfurt, Cologne, and Vienna the case was relatively simple. The fortifications, being useless for war defence, were handed to the municipalities and converted into very valuable building sites. The cities were enabled to purchase land for general purposes, and thus preserve to themselves the unearned increment. All the larger cities took this course. The increase in building value enabled them to establish special town-planning departments, and to prepare future developments of the cities. In New York, Philadelphia, and other American cities the problem was infinitely more difficult; but each city has found it profitable to expend very large sums on town-planning, and although the direct money return is not always immediately obvious, the great municipalities are more than satisfied with the broad general result. For instance, Central Park in New York was 'acquired and its improvement commenced in 1858. By the end of 1873 the city had invested in this project nearly fourteen millions of dollars, of which about five million dollars was for land, and nearly nine million dollars for improvements' (Lewis, *op. cit.*, p. 177). Sixteen years later the value of the property within the three wards contiguous to Central Park could be estimated at fifty-three million dollars, an increase of 800 per cent. as against the average increase of 100 per cent. for other parts of the city. Part of this increase, no doubt, was due to speculation, but part was undoubtedly due to the general improvement of the area. This is the kind of fact adduced to justify the great cities in the large immediate expenditure frequently involved in town-planning. But wherever town-planning is being carefully applied, the general verdict is in its favour. (For a full discussion of the British problem, see *The Case for Town-planning*, by Henry R. Alridge of the National Town-planning Council.)

Garden Cities and Garden Suburbs.—In recent British developments the garden suburb methods of town-planning have been most in evidence. The houses and house-groupings built under government direction within the last few years all followed the methods of the garden city.

The first type is Letchworth. These are the elements: an area on a main line, good roads, good site, good water, good drainage, plan of the city laid out to show civic centre, main commercial streets, traffic streets, residential areas, factory area on the outskirts. Here, in the earlier Letchworth, we notice a combination of improved English cottages arranged frequently in curved streets. The same ideas are repeated in almost all the garden villages: Earswick, near York, Bournville and Harborne, near Birmingham, and several others. But probably the best type of this kind is the garden suburb at Hampstead: in the early days the curved street and the rural walk were more or less fetishes; but in the later developments the suburb has shown equal æsthetic quality without any suggestion of freakishness of design. Fortunately its life depends on the immense resources of London, and, unlike Letchworth, it has not had to create a whole self-sufficient city, but only a convenient system of residences, picturesque enough to attract, durable enough to justify investment, and convenient enough for all the ordinary purposes of a social dwelling-place.

Housing.—A landmark in the history of British housing is the Report of the Royal Commission on the Housing of the Industrial Population of Scotland,

Rural and Urban, 1917. This report is an elaborate picture of Scottish social conditions as reflected in the housing of the people. The commission took evidence from nearly 420 witnesses; the commissioners, or groups of them, personally visited all the principal towns and rural areas of the mainland and of the islands, including the Outer Hebrides, the Orkneys, and Shetlands. They satisfied themselves by direct inspection as to the accuracy of lay and official statements about Scottish housing. Their inquiry, partially interrupted on account of the War, extended over about five years. In scope and importance it may be correctly described as the greatest social inquiry made in Scotland for at least a century. On certain points the commissioners were divided, and on these the minority produced a separate report; but the difference affected methods, not facts. The report sums up the survey as follows: 'The modest inquiry initiated by the Scottish Miners' Federation in 1909 has resulted in the national survey of Scottish housing here presented. These are the broad results of our survey: unsatisfactory sites of houses and villages, insufficient supplies of water, unsatisfactory provision for drainage, grossly inadequate provision for the removal of refuse, widespread absence of decent sanitary conveniences, the persistence of the unspeakably filthy privy-midden in many of the mining areas, badly constructed, incurably damp labourers' cottages on farms, whole townships unfit for human occupation in the crofting counties and islands, primitive and casual provision for many of the seasonal workers, gross overcrowding and huddling of the sexes together in the congested industrial villages and towns, occupation of one-room houses by large families, groups of lightless and unventilated houses in the older burghs, clotted masses of slums in the great cities. To these add the special problems symbolised by the farmed-out houses, the model lodging-houses, congested backlands, and ancient closes. To these, again, add the cottages a hundred years old in some of the rural villages, ramshackle brick survivals of the mining outbursts of seventy years ago in the mining fields, monotonous miners' rows flung down without a vestige of town-plan or any effort to secure modern conditions of sanitation, ill-planned houses that must become slums in a few years, old houses converted without necessary sanitary appliances and proper adaptation into tenements for many families, thus intensifying existing evils, streets of new tenements in the towns developed with the minimum regard for amenity.'

As the primary step towards a remedy of these conditions, the majority report of the commission concluded that 'the local authorities must be placed under an unmistakable obligation to maintain a continuous and systematic survey of their housing accommodation, to ascertain how far private enterprise can meet the demands, but, failing provision of houses by other agencies, to undertake themselves—with financial assistance from the State—the necessary building schemes. Without such a definite obligation, exercised under direction of the central authority, we are satisfied that by no administrative machinery known to us can the necessary houses be provided.' Partly as the result of the War, partly as the result of conditions established before the War, the provision of houses for the working-classes thus, for a time at least, passes largely out of the hands of private enterprise and becomes a duty of the local authorities. This recommendation was embodied in the Housing, &c. (Scotland) Act, 1919, and in the corresponding act for England: 'It shall be the duty of every local authority . . . to consider the needs of their district with respect to the provision of houses for the working-classes,

and within three months after the passing of this act, and thereafter as often as occasion arises, to prepare and submit to the Scottish Board of Health . . . a scheme for the exercise of their powers under the said Part III.' The scheme must be approved by the Board in Scotland, and the Ministry in England, as central authorities. The act contains full machinery for carrying out this obligation. When, however, schemes could be launched, the time allowed for their preparation and realisation was so short, that large numbers of local authorities came into the field at the same time, and the demand for both labour and material resulted in impossible prices. The concentration of population in the cities immediately after the War intensified the existing overcrowding, and made the closing of uninhabitable houses largely impossible. How much this means may be gauged from the fact that, reporting in 1917, the Royal Commission stated that, after careful estimates, the number of houses required for Scotland alone, in order to reduce the overcrowding to not more than an average of three persons a room, was about 121,000, and if an approved standard were adopted the total number of new houses required would approach 236,000. In England housing needs had not fallen into such serious arrears as in Scotland, where no extensive investigation had been made for more than a century; but, even in England, the number of new houses required was estimated at from one million to two millions. The financing of the gigantic schemes necessary to realise the programme implied in these figures was enough to cause any post-war government to hesitate; but it was universally allowed that the growth of population had to be provided for, and as, for the time being, private enterprise had failed to find the provision of working-class houses profitable, the public authorities could alone undertake the task—the local authority and central authority constituting a partnership authorised by parliament. It is hardly too much to say that the obligation placed on the local authority, with government assistance, to provide for the housing of the people, is among the most important legislative and administrative departures of the century.

Under the 1919 act, the number of houses produced within the scheme-period of three years fell far short of the housing demand. In the Housing, &c., Act, 1923, the financial conditions were readjusted; the government subsidy per house, whether built by local authorities or by others, was fixed at an annual amount of six pounds for twenty years, subject to certain provisions as to size of house, sale, &c. In the Housing (Financial Provisions) Act, 1924, the subsidy was increased to nine pounds per house per annum for forty years (twelve pounds ten shillings in agricultural parishes); the local authorities received special powers to confine assistance to private enterprise, and the scheme-period was extended—with certain qualifications as to audits and progress of building—to fifteen years to enable the building trade to organise and develop its resources in men and materials. The immediate objective of the 1924 act was to secure the provision of houses at rents within the competence of the wage-earning classes. A special committee was appointed to investigate the kinds of material available for building houses; steel-wall houses designed to facilitate mass-production began to be experimentally constructed. The act contains one very important town-planning provision, namely, that except with the consent of the minister, the rate of density of the houses shall not exceed 'eight per acre in an agricultural parish and twelve per acre elsewhere.' The three acts—1919, 1923, 1924—with the relevant depart-

mental circulars, are at once an index of the urgency of the housing problem, and a fine illustration of the legislative and administrative provisions necessary to solve it even partially. The 1924 act is the most far-reaching of the three in some respects, and, according to the official circular, it provides 'for a programme extending over a period of fifteen years, and aiming at a production at a gradually increasing annual rate of approximately 2,500,000 houses in Great Britain.'

Here it is impossible to enter into details as to the houses provided and yet to be provided; but, briefly, the new schemes follow the town-planning lines indicated above, and the authorities have aimed at embodying in individual houses the best features of the 'English cottage,' both in accommodation and in appearance. The commission recommended that meanwhile no more houses of one or two rooms should be built, the numbers in Scotland being already more than enough, and that the smallest house subsidised by government should be a three-roomed house. In the 1919 act this recommendation was embodied with a slight discretion in special circumstances. In the later acts several modifications have been made; but, broadly, the local authorities of the various communities, while building a proportion of two-roomed houses, have preferred houses of three rooms, four rooms, and upwards. Meanwhile, steps have been taken to assist local authorities in carrying out their other duties under the Housing of the Working Classes Acts, 1890-1909, such as the promotion of improvement schemes for unhealthy areas and the clearance of slum areas, with the necessary building to accommodate displaced populations.

The shortage in housing after the War has affected every civilised country, and each country takes its own remedial method; but it is everywhere recognised that the good housing of the people is an essential factor in the prevention of social unrest, and in the maintenance of industrial efficiency.

Aldridge, *The Case for Town-planning* (1915); T. M. Cooper and W. E. Whyte, *The Law of Housing and Town-planning in Scotland, with an Appendix of Statutes, Orders, Circulars, and Memoranda* (1920); Nelson P. Lewis, *The Planning of the Modern City* (1916); Raymond Unwin, *Town-planning in Practice: An Introduction to the Art of Designing Cities and Suburbs* (1909); H. Inigo Triggs, *Town-planning, Past, Present, and Possible*; George Cadbury, Junior, *Town-planning, with Special Reference to the Birmingham Schemes*.

Housman, ALFRED EDWARD, born 26th March 1859, educated at Bromsgrove and St John's College, Oxford, became professor of Latin in University College, London, in 1892, and in Cambridge in 1911, edited *Mamilius and Juvenal*, and wrote many papers in classical reviews. He made a name as a lyric poet of exceptionally high merit by *A Shropshire Lad* (1896), and sustained it by his *Last Poems* (1922), another set of stout-hearted melancholy variations upon 'Carpe diem.'—His brother LAURENCE, born 18th June 1867, known from 1892 as a skilled and imaginative book-illustrator, has published several volumes of poems (*Spikenard*, *Mendicant Rhymes*, and others), a number of allegorical tales (including *The Blue Moon*), religious plays, several novels (*A Modern Anteus*, &c.), and, anonymously at first, *An Englishwoman's Love Letters* (1900).

Houssa. See HAUSSA.

Houssaye, ARSÈNE (really HOUSSET; 1815-96), born near Laon, was a novelist, poet, dramatist, literary and art critic, for ten years directed the Théâtre Français, and was ultimately inspector-general of works of art.—His son HENRY (1848-1911) wrote on ancient Greek art and armies, on the Athenian republic and Spartan law before he took up the history of Napoleon in a series of very successful volumes. He became a member of the Académie, 1894.

Houston, capital of Harris county, Texas, on the navigable Buffalo Bayou, 50 miles NW. of Galveston, is the great railway centre of the state, and the Houston Ship Canal (1914) has made it a deep-water port 50 miles inland. It stands in the midst of a fertile country, and ships large quantities of cotton, cotton-seed oil, rice, lumber, petroleum, and fruit. The manufactures include machinery, railway carriages, and oil. Pop. 138,000.

Houston, SAMUEL, president of Texas, was born in Rockbridge county, Virginia, March 2, 1793, was brought up near the Cherokee territory in Tennessee, and was adopted by one of the Indians there. In 1813 he enlisted as a private soldier, and by persistent bravery rose to the rank of second-lieutenant before the end of the war. He left the army in 1818, studied law at Nashville, and was elected in 1823 and 1825 a member of congress, and in 1827 governor of Tennessee. In January 1829 he married the daughter of an ex-governor; but in the following April, for reasons never made public, he abandoned wife, country, and civilisation, and spent three years among the Cherokees, beyond the Mississippi, where his adoptive father had settled. In 1832 Houston went to Washington, and procured the removal of several United States Indian agents on charges of fraud, but got into personal difficulties with their friends. The Texan war offered a new field to his ambition. He was made commander-in-chief. The Americans at first sustained some severe losses, but on 21st April 1836 Houston with 750 men inflicted a crushing defeat on a force of 1800 Mexicans under Santa-Anna, on the banks of the San Jacinto, and by this one decisive blow achieved the independence of Texas. The hero of San Jacinto was elected first president of the republic, and re-elected in 1841, and on the annexation of Texas, in 1845, was elected to the United States senate. Elected governor of Texas in 1859, he opposed secession, was deposed in March 1861, and took no further part in public affairs. He died 26th July 1863.

Hovas. See MADAGASCAR.

Hove. See HOOVE.

Hove, a municipality within the parliamentary borough of Brighton (q.v.); pop. 46,500.

Hovedon, ROGER OF, an old English chronicler, most probably born at Howden, in Yorkshire, was attached to the household of Henry II., and in 1189 was appointed an itinerant justice for the forests in the northern counties; his *Chronicle* begins where Bede ends, with the year 732, and comes down to 1201. It is included in the *Rolls Series* (1868-71), and was translated in Bohn's series (1853).

Hoven. See HOOVE.

How, WILLIAM WALSHAM (1823-97), born at Shrewsbury. After parochial work in Shropshire, became a suffragan bishop of Bedford, and in 1888 bishop of Wakefield. He published sermons, a commentary on the gospels, devotional works, and hymns.

Howard. The noble House of Howard has stood for many centuries at the head of the English nobility. The Howards have enjoyed the dukedom

of Norfolk since the middle of the 15th century, and have contributed to the annals of the nation several persons of the most distinguished character both in politics and in literature. Neither Sir W. Dugdale nor Collins claims for the Howards any more ancient origin than Sir William Howard, a learned Chief-justice of the Common Pleas under Edward I. and Edward II., though Dugdale incidentally mentions a tradition that their name is of Saxon origin, and derived either from an eminent office under the crown before the Conquest, or from Hereward, the leader of those forces which for a time defended the isle of Ely so valiantly against William the Conqueror. The pedigree earlier than Sir William Howard has been completely demolished in an article on 'Doubtful Norfolk Pedigrees' printed in the *Genealogist*. Be this as it may, it is certain that Sir John Howard, the grandson of the above-mentioned judge, was not only admiral and captain of the king's navy in the north of England, but sheriff of Norfolk, in which county he held extensive property, which was subsequently increased by the marriage of his grandson, Sir Robert, with the co-heiress of the ancient and noble House of Mowbray, Dukes of Norfolk. The only son of this union was Sir John Howard, one of the leading supporters of the House of York, who, having gained early distinction in the French wars of Henry VI., was constituted by Edward IV. constable of the important castle of Norwich, and sheriff of Norfolk and Suffolk. He subsequently became treasurer of the royal household, obtained 'a grant of the whole benefit that should accrue to the king by coinage of money in the City and Tower of London, and elsewhere in England;' and further, was raised to the peerage as Lord Howard and Duke of Norfolk. We find him in 1470 made captain-general of the king's forces at sea, and he was most strenuous in that capacity in his resistance to the House of Lancaster. Finally he was created Earl Marshal of England, an honorary distinction still borne by his descendants, and in 1484 was constituted Lord Admiral of England, Ireland, and Aquitaine. He fell next year, however, on Bosworth Field, and after his death his honours were attained, as also were those of his son Thomas, who had been created Earl of Surrey. The latter, however, after suffering three years of imprisonment in the Tower of London, obtained a reversal of his own and his father's attainders, and, being restored to his honours accordingly, became distinguished as a general, and is more particularly celebrated in history for his defeat of the Scotch at Flodden in 1513. His son Thomas, third Duke of Norfolk, was attainted by Henry VIII., but was afterwards restored in blood, and by his marriage with a daughter of King Edward IV. became the father of the ill-fated and accomplished Earl of Surrey (q.v.), whose execution was the last of the many acts of tyranny which disgrace the memory of Henry VIII. The same sentence had been passed on the duke, when the death of the royal tyrant saved him from the block. His grandson Thomas, fourth Duke of Norfolk, in like manner suffered attainder, and was executed on Tower Hill for high-treason, for his communication with Mary, Queen of Scots. The family honours, however, were again restored, partly by James I. to his grandson, and partly by Charles II. to his great-great-grandson, Thomas, who thus became eighth duke, and whose cousin and successor, Charles, ninth duke, was the direct ancestor of the present Duke of Norfolk.

It would be impossible here to give a list of all the honours which from time to time have been conferred on various branches of the ducal House of Howard; it is sufficient to say that, in one or other of their widespread branches, the Howards either have enjoyed within the last three centuries,

or still enjoy, the earldoms of Carlisle, Suffolk, Berkshire, Northampton, Arundel, Wicklow, Norwich, and Effingham, and the baronies of Bindon, Howard de Walden, Howard of Castle Rising, and Howard of Effingham.

It will be seen from the above remarks that the ducal House of Norfolk is one whose fate it has been, beyond all others among the English nobility, to find its name interwoven with the thread of English history, and not rarely in colours of blood. The accomplished but unfortunate Surrey, and his scarcely less unhappy father, Thomas Howard—whose head was only saved from the block on which his son so nobly suffered by the death of the eighth Henry—are 'household words' in the pages of English history; and readers of Shakespeare will have other recollections of the same name allied with other historical events; while those who are familiar with the writings of Pope will not have forgotten how tersely and pointedly he typifies the glory of ancestral pedigrees by 'All the blood of all the Howards.' Other members of the House of Howard have gained a place in the pages of English history. Sir Edward Howard, K.G., brother of the first Earl of Surrey, was made by Henry VIII. the king's standard-bearer and admiral of the fleet, in which capacity he lost his life in boarding a French vessel off Brest in action in 1513; his brother, Sir Edmund, acted as marshal of the horse at Flodden; and his half-brother, Sir Thomas Howard, was attainted, and died a prisoner in the Tower, for aspiring to the hand of the Lady Margaret Douglas, daughter of Margaret, Queen of Scotland, and niece of Henry VIII. See *The Lion and the Rose* (1922), by Ethel M. Richardson.

Howard, CATHARINE, fifth queen of Henry VIII., was a granddaughter of the second Duke of Norfolk. The year of her birth, not known with certainty, was probably 1521 or 1522. Catharine was brought up partly in her father's house, partly in that of her grandmother, the Duchess of Norfolk. In 1540 the king married Anne of Cleves. But it was a marriage for which he had no liking; and Gardiner, the Roman Catholic Bishop of Winchester, being just then recalled to favour, he and his party endeavoured to bring the king and Catharine together. Anne of Cleves was divorced on the 9th of July, and Henry married Catharine Howard on the 28th of the same month. But in November the queen was accused to Henry of having been guilty of immoral conduct with two gentlemen of her grandmother's household before her marriage with the king. The evidence against her was convincing, and she was beheaded on 13th February 1542. See M. Hume, *Wives of Henry VIII.* (1905).

Howard, JOHN, the philanthropist and prison reformer, was born at Hackney, in Middlesex, on 2d September 1726, though both place and date are given differently by different authorities. His education was mostly got through private tuition. The inheritance of an ample fortune, which fell to him on the death of his father in 1742, enabled him to gratify his taste for continental travel. In 1756, after his wife's death, he set sail for Lisbon, which had just been devastated by the great earthquake, but was captured on the way by a French privateer, and carried to Brest, where he was thrown into prison. There even a short captivity sufficed to leave upon his mind a lasting impression of the inhuman treatment to which prisoners of war were subjected in French prisons. After his return home Howard married a second time, and settled at Cardington, 3 miles from Bedford. That village reaped the first-fruits of those philanthropic exertions which afterwards culminated in such noble labour, the work of prison reform. In 1773 Howard was nominated high-sheriff for the county of Bedford, and

his interest in prisons and their inmates was now first fairly roused to the pitch of practical effort. He was struck with the injustice under which many poor prisoners suffered, in that they were detained in prison untried, or even after being pronounced innocent, until they or their friends had paid certain fees to the gaolers and other officials. Howard at once began a long series of tours throughout Great Britain and Ireland, for the purpose of investigating the condition of prisons, and inquiring into the management and treatment of prisoners. Chiefly as the result of his efforts, two acts were passed in 1774, one making provision for fixed salaries to be paid to the gaolers, and the other enforcing greater cleanliness in prisons, with a view to the prevention of the dreaded gaol-fever. From this time onward Howard prosecuted with unwearied zeal and patience this the great work of his lifetime, upheld by an indomitable sense of duty, and supported by a devout faith and his own firm, steadfast will. The remaining years of his life were principally spent in visiting the prisons of Great Britain and the countries of the Continent. Amongst the graver abuses he set himself to get abolished in his native land were such things as these: many prisons were in a deplorably dilapidated state, the cells narrow, filthy, and unhealthy; debtors and felons were confined promiscuously in the same prisons; separate apartments were not provided for the two sexes, and the gaolers were allowed to sell liquors to those placed under their charge, causes directly ministering to immorality and drunkenness. Howard's endeavours to relieve human suffering in prisons easily turned his thoughts to hospitals; and he also directed his efforts to the alleviation of suffering and the removal of abuses in these establishments, as well as in schools and all kinds of benevolent institutions. From 1785 he devoted his attention more especially to the plague, and to the consideration of means for its prevention. With this end in view, he studied it in the hospitals and lazarettos of the chief Mediterranean towns in which it was wont to show itself. But whilst still pursuing his investigations, he was himself struck down by typhus fever at Kheron, in Russia, and died on 20th January 1790. He was buried at Dophinovka (now Stepanovka), 4 miles N. of Kheron. The chief results of his extensive observations were recorded with faithful accuracy and great minuteness of detail, though with little sense of generalisation, in two works—*The State of Prisons in England and Wales, with an Account of some Foreign Prisons* (1777), to which a supplement was added in 1780, whilst the editions of 1784 and 1792 were each an enlargement on its predecessor; and *An Account of the Principal Lazarettos in Europe* (1780). In consequence of his noble self-denying labours Howard has become the proverbial ideal of a philanthropist, the type of the best kind of humanitarian activity and love. Burke, in speaking of his labours at Bath in 1781, said, 'He has visited all Europe, not to survey the sumptuousness of palaces or the stateliness of temples; nor to make accurate measurements of the remains of ancient grandeur, nor to form a scale of the curiosity of modern art; nor to collect medals or collect manuscripts; but to dive in the depths of dungeons, to plunge into the infection of hospitals, to survey the mansions of sorrow and pain, to take the gauge and dimensions of misery, depression, and contempt, to remember the forgotten, to attend to the neglected, to visit the forsaken, and to compare and collate the distresses of all men in all countries. . . . It was a voyage of discovery, a circumnavigation of charity.' See Lives by Baldwin Brown (1818), Taylor (1836), Hepworth Dixon (1849), Field (1850), and Stoughton (1853; new

ed. 1884); *Correspondence of Howard* (1855) by J. Field; and the article PRISONS.

Howard, OLIVER OTIS, an American general, was born at Leeds, Maine, 8th November 1830, graduated at West Point in 1854, took command of a regiment of Maine volunteers in 1861, and was made brigadier-general for gallantry at the first battle of Bull Run. He lost an arm at Fair Oaks in 1862, but afterwards was in several actions, and in 1864 commanded the Army of the Tennessee in the invasion of Georgia. He commanded the right wing of Sherman's army in the march to the sea and through the Carolinas. He was commissioner of the Freedmen's Bureau from 1865 until its abolition in 1874, and was the first president of Howard University (see WASHINGTON, D.C.), which was named in his honour. He conducted two Indian campaigns, in 1877 and 1878; in 1886 he was promoted to major-general, and received the command of the division of the Pacific; in 1889 he was transferred to that of the Atlantic. A chevalier of the Legion of Honour, he wrote on his campaigns, on *Isabella of Castile*, on President Taylor, and an autobiography. He died 26th October 1909.

Howard, WILLIAM (1563–1640), known as Belted Will, was third son of the fourth Lord Howard, and married a daughter of Lord Daere. He studied at Cambridge, was imprisoned with his brother the Earl of Arundel on suspicion of treason, joined the church of Rome, and was for a time deprived of part of the Daere estates. His home was Naworth Castle; and as a border commissioner he did great service in repressing marauding. Lord William Howard was an accomplished scholar and antiquary.

Howard of Effingham, CHARLES, LORD, was born in 1536, and in 1573 succeeded his father, who was the ninth son of the second Duke of Norfolk, and who in 1554 had been raised to the peerage and been made Lord High Admiral. In 1585 that dignity was conferred on the son, and as such in 1588 he commanded gloriously against the Armada (q.v.). For his share with Essex in the Cadiz expedition (1596) he was created Earl of Nottingham, and in 1601 he put down Essex's mad insurrection. In 1619 he resigned his office in favour of Buckingham; and he died 14th December 1624. Apparently he was *not* a Catholic.

Howdeshire is a wapentake in the East Riding of Yorkshire.

Howe, ELIAS (1819–67), was the son of a miller at Spencer, Mass., was trained in a machine shop, and by 1845 had perfected at Cambridge, Mass., the first lock-stitch Sewing-machine (q.v.). With much difficulty he secured his patent, especially against Singer, but died a millionaire.

Howe, JOHN, the most philosophic of the Puritan divines, was born 17th May 1630, son of the vicar of Loughborough, in Leicestershire. He studied both at Oxford and Cambridge, and having served as perpetual vicar of Great Torrington, in Devonshire, was appointed domestic chaplain to Cromwell in 1656, discharging his difficult duties with rare firmness and courtesy. At the Restoration he returned to Torrington, where he remained for about two years, but the Act of Uniformity ejected him in 1662, and he wandered about preaching in secret till 1671. In 1668 he published his first work, *The Blessedness of the Righteous*, which was very popular. In 1671 he was invited by Lord Massereene, of Antrim Castle, in Ireland, to become his domestic chaplain, where he spent four years of great happiness, preaching every Sunday at Antrim church, with the sanction of the bishop. Here he wrote his *Vanity of Man as Mortal*, and began his greatest work, *The Good Man*

the *Living Temple of God* (1676-1702), which occupies one of the highest places in Puritan theology. In 1675 he was called to be pastor of the dissenting congregation in Silver Street, London, and went thither in the beginning of 1676. In 1677 he published, at the request of Mr Boyle, *The Reconcilableness of God's Presence of the Sins of Men with the Wisdom of His Counsels, and Exhortations*; in 1681, *Thoughtfulness for the Morrow*; in 1682, *Self-dedication*; in 1683, *Union among Protestants*; and in 1684, *The Redeemer's Tears wept over Lost Souls*. In 1685 he was invited by Lord Wharton to travel with him on the Continent; and after visiting the principal cities, he resolved, owing to the state of England, to settle for a time at Utrecht, where he was admitted to several interviews with the Prince of Orange. In 1687 the Declaration for Liberty of Conscience induced him to return to England, and at the Revolution next year he headed the deputation of dissenting clergymen when they brought their address to the throne. Besides smaller works, he published, in 1693, *Carnality of Religious Contention*; in 1694-95, several treatises on the Trinity; in 1699, *The Redeemer's Dominion over the Invisible World*; and he continued writing till 1705, when he published a characteristic work, *Patience in Expectation of Future Blessedness*. He died 2d April 1705.

Howe was a man of a noble presence, with a finely-balanced mind, a profound thinker, yet gifted with great practical sagacity. His own convictions were very decided, yet he had large toleration for the opinions of others, and of one of his persecutors writes 'he did not doubt after all to meet him one day in that place where Luther and Zwinglius well agreed.' The value of his writings is greatly marred by a poor style and innumerable subdivisions and digressions. Robert Hall 'derived more benefit from the works of Howe than from those of all other divines put together.' He was often employed in the most delicate affairs by Cromwell. There are Lives by Calamy (prefixed to the 'works,' 2 vols. folio, 1724), Rogers (1836), and Horton (1895).

Howe, JOSEPH (1804-73), the son of a United Empire Loyalist, who became king's printer and postmaster-general in Nova Scotia, was born in Halifax, and, as editor and proprietor of the *Nova Scotian*, became famous for his own brilliant contributions—sketches, 'Rambles,' papers on the model of *Noctes Ambrosianæ*, and weightier reviews. He fought for full freedom of the press, and, elected to the provincial assembly, gave twelve years to the task of securing responsible government. In 1863-70 he was premier, after confederation sat in Macdonald's Canadian government, and died just when he had been appointed lieutenant-governor of Nova Scotia. His letters and speeches form part of Canadian national literature; and there are Lives of him by Fenety (1896) and Longley (1905).

Howe, JULIA WARD. See **HOWE (SAMUEL GRIDLEY)**.

Howe, RICHARD HOWE, EARL, admiral, son of Viscount Howe of the Irish peerage, was born in London, 8th March 1726. He left Eton at thirteen, and, entering the navy, served under Anson (q.v.) against the Spaniards in the Pacific. Made post-captain at twenty, he in that same year drove away from the coast of Scotland two French ships conveying troops and ammunition to the young Pretender. After serving off the coast of Africa, Howe took an active part in the naval operations of the British during the Seven Years' War, especially distinguishing himself by the capture of the island of Chaussey, in the attacks upon the isle of Aix, St Malo, and Cherbourg, and in engagements with the French fleet in 1755 and 1759. In 1758 he succeeded to the

Irish title of viscount on the death of his brother, George Augustus (1724-58), the brigadier-general, who was killed before Ticonderoga. Appointed a Lord of the Admiralty in 1763, he was promoted two years later to the important office of Treasurer of the Navy. In 1778 he defended the American coast against a superior naval force under D'Estaing, whom he repelled off Rhode Island. He was made a viscount of Great Britain in 1782. Being sent out the same year to relieve Gibraltar, he disembarked troops, ammunition, and supplies, and then offered battle to the combined fleets of France and Spain, but they, declining an engagement, drew off towards Cadiz. Howe was made First Lord of the Admiralty in 1783, and received an English earldom in 1788. When war with France broke out in 1793 he took command of the Channel fleet, and next year gained off Ushant the victory which is known as that of 'the glorious first of June.' The French fleet consisted of twenty-six ships of the line, and the British of twenty-five. In a very short time the latter captured seven of the enemy's vessels and dismasted ten more. Howe's last public service was to bring back to their duty the mutinous seamen at Spithead and Portsmouth in 1797. He died August 5, 1799, leaving the reputation of being a thorough seaman, cautious, cool and intrepid in danger, and considerate of his men. He greatly increased the efficiency of the navy by the introduction of a new system of evolutions and naval tactics. See Lives by G. Mason (1803) and Sir J. Barrow (1838).—A brother, **WILLIAM** (1729-1814), held a command under Wolfe at Quebec, succeeded General Gage in 1775 as commander-in-chief of the British forces in America, commanded at Bunker Hill, took New York, defeating Washington at White Plains and at Brandywine, but was superseded by Sir Henry Clinton in 1778 for having lost the opportunity of destroying the American force at Valley Forge. He subsequently held various honorary commands in Britain, and succeeded to his brother's viscounty in 1799.

Howe, SAMUEL GRIDLEY, M.D., an American philanthropist, was born in Boston, November 10, 1801, and graduated at Brown University in 1821, and at the Harvard medical school in 1824. He served as a surgeon during the Greek war of independence from 1824 to 1827, organising the medical staff of the Greek army. He then went to America to raise contributions, and, returning with food, clothing, and supplies, formed a colony on the isthmus of Corinth. Swamp-fever, however, drove him from the country in 1830. In 1831 he went to Paris to study the methods of educating the blind, and, having become mixed up in the Polish insurrection, spent six weeks in a Prussian prison. On his return to Boston he established a school for the blind, his most famous pupil being Laura Bridgman (q.v.). He also established a school for the training of idiots. In 1851-53, assisted by his wife, he edited the anti-slavery *Commonwealth*, and, after revisiting Greece in 1867 with supplies for the Cretans, he edited in Boston *The Cretan*. He died 9th January 1876.—His wife, **JULIA WARD HOWE** (1819-1910), born in New York City, became prominent in the woman-suffrage movement from 1869, preached in American Unitarian pulpits, and published, besides narratives of travel and a *Life of Margaret Fuller*, several volumes of poems, *Passion Flowers* (1854), *Words for the Hour* (1857), and *Later Lyrics* (1866), the last the best. In 1861 she wrote the 'Battle-hymn of the Republic.'

Howell, JAMES, whose *Familiar Letters* is still an English classic, was born in July 1593, son of the minister of Abernethy, in Carmarthenshire, studied at Hereford and Jesus College, Oxford, and took

his B.A. in 1613. He then became steward to a glass-varemanufactory, and traversed in its interests Holland, Flanders, Spain, France, and Italy. He was next employed abroad on public business in 1626, became secretary to Lord Scrope at York, was returned to parliament for Richmond in 1627. From 1632 to 1642 he was mainly employed as a royalist spy; and in 1642 (when he was appointed an extra clerk to the Privy-council) he was sent by the parliament to the Fleet, where he lay till 1650. At the Restoration the office of historiographer-royal was created for him. He died in 1666, and was buried in the Temple church. Howell was a man of considerable humour, learning, and industry. Besides translations from Italian, French, and Spanish, he wrote no less than forty-one original works on history, politics, and philological matters. He had put his travels to much profit. 'Thank God,' he says, 'I have this fruit of my foreign travels, that I can pray unto him every day of the week in a separate language, and upon Sunday in seven.' His *Instructions for Forreine Travell* (1642) is still interesting, and is reprinted in Professor Arber's series (1869); and his supplement to Cotgrave's French and English dictionary maintains its interest for lexicographers; but it is by his *Epistolæ Ho-Elizianæ: or Familiar Letters, Domestic and Foreign* (1645-55; 10th ed. 1737), that his name continues to be remembered. These display not only shrewd sense and brilliant wit, but also grace and form, and indeed are the earliest letters in our language that are really literary.

Dr Bliss, the erudite editor of Wood's *Athenæ Oxonienses*, intended to edit Howell's Letters; this was at length adequately done by Mr Joseph Jacobs in 1892.

Howell's State Trials, the name given to the series originated by Cobbett in 1809, because vols. xi. to xxi. of this work were edited by Thos. Bayly Howell (1768-1815), and vols. xxii. to xxxiii. by his son, Thos. Jones Howell (died 1858).

Howells, WILLIAM DEAN (1837-1920), a popular American novelist, was born at Martin's Ferry, Ohio. His father's family was of Welsh Quaker origin, and he himself was brought up a Swedenborgian. From an early age he was familiar with press-work, as his father was a busy and not always prosperous printer and journalist; but his earliest serious work in journalism was in the *Cincinnati Gazette* and *Columbus State Journal*. A life of Lincoln, written in 1860, procured him the post of consul at Venice, which he held from 1861 to 1865, making himself master of Italian the while, and writing his able papers, collected in *Venetian Life* (1866). After his return to America he wrote for the *New York Tribune* and the *Times*, the *Nation*, and the *Atlantic Monthly*, and filled the editor's chair of the last from 1872 till his retirement in 1881. His later work in periodicals was done for the *Century* and *Harper's Magazine*. He had already made his mark as a first-rate journalist, a fair poet, and a clever critic, when in 1871 he found his real work as a writer of fiction. His clever story, *Their Wedding Journey*, at once brought him popularity which quickly grew in England no less than America, as the growing merit of succeeding novels made it more and more deserved. Amongst these were *A Chance Acquaintance* (1873), *A Foregone Conclusion*, *A Counterfeit Presentment*, *The Lady of the Aroostook* (1878), *The Undiscovered Country*, *Doctor Breen's Practice*, *A Modern Instance*, *A Woman's Reason*, and *The Rise of Silas Lapham* (1885). Later stories were *An Indian Summer* (1886), *Annie Kilburn*, *A Hazard of New Fortunes*, *The World of Chance*, *An Open-eyed Conspiracy*, *The Ragged Lady*, *Their Silver Wedding Journey*, *The Kentons*, and—greeted as one of his best—*The Son of Royal Langbrith*

(1904). He wrote about a hundred books, including travels, farces and plays, essays and criticisms; nameworthy amongst these are *Tuscan Cities* (1885), *Criticism and Fiction*, *Impressions and Experiences*, *Modern Italian Poets*, *Literary Friends and Acquaintance*, *Letters Home* (1903), *My Mark Twain* (1910), *Years of My Youth* (1916)—some of them collected from the magazines.

These works reveal their author to us as an artist of decided limitations as well as gifts—humorous, brilliant, epigrammatic, and acute, though his conscientiously detailed analysis of commonplace characters is occasionally overdone to the extent of tediousness. His over-elaborated Bostonians, and his Americans expanding spiritually under the new conditions of an ancient civilisation in some Italian city, are always carefully painted and indeed striking portraits; sometimes he reaches and touches the inner springs of American character at home and abroad. The founder of the school of American realists—not uninfluenced by Balzac and the Russians—insisted on seeing Americans as they are, avoiding overmuch psychological analysis and idealised dialogue; but commanded on occasion both humour and wit.

Howietoun. See PISCICULTURE.

Howitt, WILLIAM and MARY, whose writings charmed, interested, and instructed the public during the earlier half of the 19th century, may best be treated together. William Howitt, the son of a land-surveyor of good descent, a member of the Society of Friends, was born at Heanor, Derbyshire, in 1792, and was educated at Ackworth and Tamworth. With no intention of pursuing the business he served a four years' apprenticeship to a builder, carpenter, and cabinetmaker. Possessed of strong literary tastes, and fond of country life and sports, he wrote poems, and an account of a country excursion after the manner of Washington Irving. On April 16, 1821, William Howitt married Mary Botham, a young lady of kindred tastes (born at Uttoxeter, 12th March 1799), and they settled at Hanley, to conduct a 'chemist's business. After a few months they removed to Nottingham for twelve years of steady and successful literary industry and mental improvement. Their later places of abode were Esher, in Surrey, London, Heidelberg, and Rome. The record of their after-life is a record of the books they wrote, of pleasant travel for literary purposes, while they were on terms of easy intercourse with all their notable contemporaries. In 1852-54, at the height of the gold-fever, William Howitt was in Australia. The Howitts were instrumental in getting £1000 for Miss Meteyard's life of Wedgwood, and it was at William Howitt's suggestion that Mrs Gaskell wrote her first novel. They quitted the Society of Friends in 1847; William Howitt became a believer in spiritualism, and in May 1882 Mary Howitt joined the Catholic communion. After a long life of blameless literary industry William Howitt died at Rome, March 3, 1879. Mary Howitt, whose heart and mind 'ever flowed with love and interest for all her surroundings,' composed and wrote from her earliest years, and most people have seen or read some of her poems, ballads, novels, or juvenile tales, of which she wrote many. By means of translations she first made the works of F. Bremer and Hans Andersen known to the English public. She wrote for the annuals, for the *People's Journal*, *Howitt's Journal*, *Chambers's Journal*, &c. A pension was bestowed upon her in 1879 by Lord Beaconsfield. She died at Rome, January 30, 1888, and her remains were laid beside those of her husband in the cemetery of Monte Testaccio. One critic has justly said that W. Howitt and his wife

are inseparably associated with all that is enchanting in rural England. In their poems, their novels, and the stories of their country rambles they made themselves the exponents of nature, blending the idealism of poetic fancies with pictures that have the realism of photographs. In politics William Howitt was an extreme Radical. Joint productions of William and Mary Howitt were the *Forest Minstrel* (1827), *Desolation of Eyam* (1827), *Book of the Seasons* (1831), *Literature and Romances of Northern Europe* (1852), *Stories of English Life* (1853), and *Ruined Abbeys of Great Britain*. William Howitt's chief works, besides contributions to newspapers and magazines, were *History of Priestcraft* (1833); *Pantika* (1835); *Rural Life in England* (1837); *Visits to Remarkable Places* (1838; second series, 1841); *Colonisation and Christianity* (1838); *Boy's Country Book* (1839); *Student Life of Germany* (1841); *Homes and Haunts of the Poets* (1847); *Land, Labour, and Gold* (1855); *Illustrated History of England* (6 vols. 1856-61); *History of the Supernatural* (1863); *Discovery in Australia, Tasmania, and New Zealand* (1865); *Mad War Planet, and other Poems* (1871). See *Mary Howitt, an Autobiography*, edited by her daughter, Margaret Howitt (2 vols. 1889).

Howitzers (Ger. *Haubitzen*) are guns which came into use early in the history of field artillery, as portable instruments for discharging shell into a hostile force. As for this purpose no great range was necessary, a small charge of powder sufficed; and the howitzer could be made, in proportion to its large bore, extremely light. For modern howitzers, see CANNON.

Howler, **HOWLING MONKEY**, or **STENTOR** (*Myctes*), a genus of Central and South American monkeys, remarkable for the dilatation of the hyoid bone into a hollow drum, which communicates with the larynx, makes a conspicuous external swelling of the throat, and gives prodigious power to the voice, enabling these animals to emit hideous sounds, which can be heard at least two miles away, and to which all their names refer. They live chiefly among the branches of trees, and take extraordinary leaps from one to another, taking hold by the tail like most of the American Platyrrhine monkeys, as readily as by the hands, and often swinging by it alone. They are gregarious, and unite their voices in concert, so as to produce a most deafening noise; this is what Humboldt and others say, but according to Wallace it is only one individual at a time which causes all the sound. The monkeys of this genus have a low intelligence, and their brain structure bears out this view. A howler was first brought alive to Europe and exhibited at the Zoological Gardens, London, in 1863. There are apparently not more than six species.

Howrah, or **HAURA**, a suburb of Calcutta, with growing manufactures, on the right or west bank of the Húglí, is connected with Calcutta by a bridge, and is the Bengal terminus of the East Indian and Bengal-Nagpur Railways; pop. (1921) 195,301.

Howson, **JOHN SAUL**, dean of Chester, was born in 1816, and in 1837 took a double first-class at Cambridge. Taking orders eight years later, in 1849 he became principal of the Liverpool College, and in 1867 dean of Chester. The complete restoration of the cathedral was in great measure due to his energy and devotion. He died 15th December 1885. With Conybeare he wrote the well-known *Life and Epistles of St Paul* (1852).

Howth, a peninsula on the east coast of Ireland, forming the north side of the Bay of Dublin, terminates in a lofty cliff, at the foot of which

nestles the village of Howth, the chief fishing-station on that part of the coast.

Hoxton, a district of London, partly in Hackney, but mainly in Shoreditch.

Hoy (Scand. *Hoey*, 'high island'), one of the Orkneys, $1\frac{1}{2}$ miles SW. of the island of Mainland. It is $13\frac{1}{2}$ miles long, 3 furlongs to $6\frac{1}{2}$ miles broad, and 53 sq. m. in area. Unlike the rest of the group, Hoy rises abruptly from the sea, with stupendous cliffs that attain 1140 feet in Bracbrough or St John's Head, and 595 in Bervy Hill; inland are Cuilags Hill (1420 feet) and the Ward Hill (1564), commanding a splendid panoramic view. The rocks represent both the Upper and the Lower Old Red Sandstone. Near the south end is the fine natural harbour of Long Hope ($5\frac{1}{2} \times 1\frac{1}{2}$ miles). The 'Dwarfie Stone' is a sandstone block, 28 feet long, $14\frac{1}{2}$ broad, $6\frac{1}{2}$ high, with a chamber hollowed out of it; and the 'Old Man of Hoy' is an insulated pillar of rock, 450 feet high. Pop. 1000.

Hoylake, a small watering-place of Cheshire, at the extremity of Wirral peninsula, 8 miles W. of Birkenhead, with famous golf-links, opened in 1869; pop. with West Kirby, 17,000.

Hoyle, **EDMOND**, the creator of whist, was born in 1672, and is said to have been educated for the bar. Little is known about his life, except that he lived for some time in London, writing on games and giving lessons in whist, and died there on 29th August 1769. In 1742 he published his *Short Treatise on Whist*, containing the laws and some rules, for which he is said to have received £1000, and which in 1763 reached a 13th edition. See WHIST, and *Notes and Queries* for 1889.

Hrabanus. See **RABANUS MAURUS**.

Hradschin. See **PRAGUE**.

Hrolf Kraki, a 6th-century Danish king, nephew of Hrothgar, is in *Beowulf* called Hrothwulf.

Hroswitha, or **ROSWITHA** (c. 932-1002), a Benedictine nun of Gandersheim, wrote Latin poems and six Terentian comedies, edited by Konrad Celtes (Nür. 1501) and Barack (*ibid.* 1858). There are several English translations. See **DRAMA**.

Hualla'ga, a river of Peru, rises near the Cerro de Pasco, over 14,000 feet above the sea, flows north on the east side of the Central Cordillera, breaks through the range at the gorge of Chasuta, and enters the Marañon. Its total length is about 650 miles; it is navigable as far as Yurimaguas, above which are falls and rapids.

Huamanga. See **AYACUCHO**.

Huanaco, or **GUANACO** (*Lama huanacos*; see **LLAMA**), a species of the same genus of Camelidæ with the vicuña and alpaca, of which some naturalists suppose it to be the wild original. It is found on the Andes and throughout great part of Patagonia. It is of a reddish-brown colour, the ears and hind-legs gray. It generally lives in herds of ten to forty, and is very quick-sighted and wary; although such is the strength of its curiosity that hunters attract the herds within easy reach of their rifles by lying down on the ground and kicking their feet in the air. Like its congeners, the huanaco is extremely sure-footed on rocky ground.

Huancavelica, a department of Peru, lying entirely within the Cordilleras, with an area of 9000 sq. m.; pop. 300,000. The climate is cold and raw on the mountains, where sheep, cattle, and llamas are herded, and hot in the deep valleys, where sugar is grown. The chief riches are in the mines, especially of silver and quicksilver.—The capital, Huancavelica, 150 miles SE. of Lima, is a dreary mining town in the sierras; pop. 5000.

Huanchaca, seat of the chief silver-mines in Bolivia (q.v.).

Huánuco, a department of Peru, with an area of over 13,000 sq. m. Mining and agriculture are the chief industries. Pop. 200,000.—The capital, Huánuco, lies in a lovely valley on the Hualлага, amid plantations of coffee and sugar. It is a bishop's see. Pop. 5300.

Huber, FRANÇOIS, author of a book on the habits of bees, was born at Geneva, 2d July 1750, and died, 22d October 1830, at Pregny near his birthplace. At an early age he lost his eyesight, but with the assistance of his wife and an intelligent domestic he conducted a number of original and important observations on the habits of bees. His book first appeared as *Lettres à Ch. Bonnet* (1792); it was reprinted in 1796, and again in 1814, under the title of *Nouvelles Observations sur les Abeilles*. In his later years he derived important aid from his son, JEAN PIERRE (1777–1841), who wrote a valuable treatise on the *Habits of Ants* (1810).

Hubert, St, Bishop of Liège, was son of Bertrand, Duke of Guienne, and was born in 656. He lived a luxurious and worldly life, first at the court of the Frankish king Theoderich, next under Pepin of Heristal, but after the death of his wife retired from the world into a monastery, on the advice of Bishop Lambert. Afterwards, when on a pilgrimage to Rome, he was made by Pope Sergius I. Bishop of Tongern, and in 708 succeeded his master, Lambert, in the see of Maestricht and Liège. He died in 727, and was afterwards canonised; his festival falls on November 3. He has been patron of orders of knighthood in Bavaria and Bohemia. See the books by Fétis (1846), Des Granges (1872), and Heggen (1875). In legend and in art, since the 15th century, St Hubert appears as a mighty hunter who was startled into repentance when hunting on Good Friday by the sudden appearance of a stag bearing between his horns a radiant crucifix. At once he renounced hunting and all worldly pleasures, and became after his canonisation the patron saint of hunters. His aid is especially efficacious for persons bitten by mad dogs and those possessed with devils. See H. Gaidoz, *La Rage et St Hubert* (1887).

Hubertusburg, formerly a royal hunting-seat of Saxony, 25 miles E. by S. from Leipzig, built in 1721 by Prince Frederick Augustus, afterwards King Augustus III. of Poland. It was much injured during the Seven Years' War; and there on 15th February 1763 was signed the treaty by which that war was ended. Since 1840 the buildings have served as a prison, a hospital, an asylum for the insane, and a refuge for idiot children.

Hubli, a town of Dharwar in the presidency of Bombay, stands on a good road leading to Karwar on the Malabar coast, 102 miles to the south-west. It contains (1921) 69,206 inhabitants, and is one of the principal cotton-marts in that section of India.

Hübner, RUDOLF JULIUS BENNO, German painter, was born at Oels, in Silesia, 27th January 1806. He studied at Düsseldorf, to which school of painting he belongs. In 1841 he was appointed professor of Painting in the academy at Dresden, and was director of the picture-gallery from 1871 to 1882, in which year he died, 7th November, at Loschwitz, near Dresden. Among his pictures are 'Job and his Friends,' 'Charles V. in San Yuste,' 'Frederick the Great in Sansouci,' 'The Golden Age,' and 'The Dispute between Luther and Dr Eck.' He also designed glass paintings, including some for the crypt of Glasgow Cathedral.

Huc, ÉVARISTE RÉGIS, French missionary and traveller, was born at Toulouse, 1st August 1813. Almost immediately after his ordination he joined in 1839 the missionary expedition of his order, the Lazarist Fathers, to China. In 1844 Huc, in

company with Père Gabet and a single native convert, set out with the intention of penetrating to the unknown land of Tibet, beyond the terrible desert of Gobi. But it was not until January 1846 that they succeeded in reaching Lhasa, the capital of Tibet, and the residence of the Dalai Lama. And scarcely had they settled in that city and started a mission, when an order for their immediate expulsion from the country was obtained by the Chinese resident in Lhasa. They were conveyed back to Canton. His health having failed, he returned to France in 1852, and died in 1860. Later exploration has only confirmed the credibility (long disputed) of his *Voyage dans la Tartarie, le Thibet, et la Chine* (1850; trans. by Hazlitt, 1852), *L'Empire Chinois* (1854; trans. 1855), and *Le Christianisme en Chine* (1857–58; trans. 1858).

Huch, RICARDA, German poet, novelist, and critic, was born 18th July 1864 at Brunswick. She studied at Zürich, took her degree of doctor of philosophy in 1887, was secretary to the town library there, and a teacher in Bremen, and afterwards lived in Vienna and various towns of Germany. After some youthful attempts at drama she wrote a novel, *Erinnerungen von Ludolf Ursleu dem Jüngeren* (1893), which was followed by other novels, collections of tales, and of lyrics. From 1899 onwards she produced several books of criticism, dealing notably with Romanticism and with Gottfried Keller. By nature a romanticist, she yet gained high distinction as an historical novelist on Italian and German themes. Later works deal with questions of social philosophy—with defect of personality in the present age (no defect of hers), with Bakunin, &c.

Huchown, described as of the 'Awle Ryale' (royal palace), and author of the *Morte Arthure* and other early Scottish alliterative poems, has been somewhat hazardingly identified with Dunbar's 'Syr Hew of Eglyntoun,' brother-in-law of Robert II., Chamberlain of Cunningham and Justiciar of Lothian, who lived about 1310–76. See G. Neilson's *Huchown* (1902).

Huckleberry. See WHORTLEBERRY.

Huddersfield, a 'clothing town' in the West Riding of Yorkshire, a municipal and county borough, 26 miles NE. of Manchester, 15 S. of Bradford, 17 SW. of Leeds, and 189 NNW. of London. Well built of stone and regular, it occupies a considerable extent of high ground, sloping down to the left bank of the Colne, which here receives the Holme; and it owes its rapid extension to its situation in a rich coal-district, to its abundant water-power, and to its transit facilities by rail and canal. Among the chief edifices are the circular cloth-hall (1768–80); the railway station (1848), with a marble statue of Peel (1875) before it; the classical town-hall (1880); the market-hall (1880); the infirmary (1831–1902). The Mechanics' Hall (1848), developed into the Technical School (1883); the public library and art gallery (1898). The first parish church of Huddersfield was built before 1110, rebuilt in Tudor times, and again (unhappily before the revival of architecture) in 1835. St John's (1853) was designed by Butterfield, and St Thomas's (1859) by Sir George Gilbert Scott. The Beaumont Park, 21 acres in area, was opened in 1883, and there also is Greenhead Park of 26 acres. Huddersfield is the chief seat in the north of England of what is called the 'fancy trade,' and every description of plain woollen goods is also manufactured; whilst other industries are cotton and silk spinning, iron-founding, machine-making, dye-making, &c. Roman remains have been found; it is mentioned in Domesday Book; but as late as 1750 Bishop Pococke described it as 'a little town.' It was enfranchised by the Reform Act of 1832,

and made a municipal borough in 1868, the boundary having been greatly extended the year before. Pop. (1861) 34,877; (1871) 74,358; (1881) 86,502; (1901) 95,008; (1921) 110,120.

Hudson, a river in New York, and one of the most beautiful and important in America. It rises in the Adirondack Mountains, 4326 feet above the level of the sea, its head-streams the outlets of many mountain-lakes. At Glen's Falls it has a fall of 50 feet, and soon after, taking a southerly course, runs nearly in a straight line to its mouth, at New York City. It is tidal up to Troy, 151 miles from its mouth, and magnificent steamboats ply daily between New York and Albany. Below Newburg, 60 miles from New York, the river enters the highlands, which rise abruptly from the water to the height of 1600 feet. Here historical associations add to the interest of scenery of singular beauty and grandeur: here was the scene of Arnold's treason and of André's fate; and at West Point, the seat of the United States military academy, 8 miles below Newburg, are the ruins of Fort Putnam, built during the war of independence. Emerging from the highlands, the river widens into a broad expanse called Tappan Bay, which is 4½ miles wide and 13 long. Below, on the right bank, a steep wall of trap-rock, called the Palisades, rises from the river's brink to a height of 300 to 510 feet, and extends for nearly 20 miles to the upper portion of the city of New York. The river from here is known as the North River, and is from 1 to 2 miles wide; and after passing between New York and Hoboken and Jersey City, it falls into New York Bay. Its whole length is about 350 miles, and its principal tributaries are the Sacondaga, Mohawk, and Walkill. The Hudson has valuable shad and sturgeon fisheries. It was discovered by Verrazani in 1524, but is named from the English navigator who explored it in 1609. The Indian name is Shalemunc. It is connected by canals with Lakes Erie and Champlain. Robert Fulton's first successful experiment in steamboat navigation was made on this river in 1807. Railways run parallel to both banks; and several tunnels beneath the Hudson connect the railways and roads of New York and New Jersey.

Hudson, capital of Columbia county, New York, stands on the left bank of the Hudson River, and on the Hudson River Railroad, 116 miles N. of New York City. It extends along a high ridge ending in a bold promontory, at whose foot are the wharves. Large vessels can ascend the river to this point, and the place had formerly a considerable West Indian trade and whale fisheries. At present it has only an active river trade. Hudson has a fine court-house, a city hall, and manufactures of clothing, car-wheels, automobile bodies, knit goods, machinery, &c., also foundries and blast-furnaces. Pop. 12,000.

Hudson, GEORGE, the 'Railway King,' was born near York in March 1800. There he subsequently carried on business as a linen-draper. Inheriting a fortune of £30,000 in 1828, Hudson withdrew from business, and began to interest himself in local politics and in railway speculation. He became the ruling spirit of the York and North Midland Railway Company; and his ventures and schemes for amalgamating various railway companies were attended with extraordinary success. Hudson was elevated to the dictatorship of railway speculation. Everything he touched turned to gold. He bought large estates, was three times elected lord mayor of York, and was sent to parliament by the electors of Sunderland (1845). But the railway mania of 1847-48 plunged him into ruin. He was accused of having 'cooked' the accounts of companies with which he was con-

nected, and of having paid dividends out of capital. Legal proceedings were instituted against him, and his suddenly-acquired gains were almost entirely swept away. The constituency of Sunderland, however, continued to elect him as their representative until March 1859. He afterwards lived in comparatively narrow circumstances, and died in London, December 14, 1871.

Hudson, HENRY, a distinguished navigator, of whom we know nothing before April 1607, when we find him starting, in a small vessel with ten sailors, on his first unfortunate voyage for the discovery of a north-east passage. In his second voyage in 1608 he reached Nova Zembla. He undertook a third voyage in 1609 from Amsterdam, at the expense of the Dutch East India Company. Giving up all hope of finding a north-east passage, he sailed for Davis Strait, then steered southwards in search of a passage, discovered the mouth of the river which now bears his name, and sailed up its waters for 150 miles. He sailed upon his last voyage in April 1610, in the *Discoverie* of 70 tons, and reached Greenland in June. Steering westward, he discovered the strait now known as Hudson Strait, and passed through it, and entered the great bay which has received the name of Hudson Bay. Although very insufficiently supplied with provisions, he resolved to winter in these desolate regions, in order to prosecute his discoveries further in the following spring. The food fell short, and the men, dissatisfied with Hudson's determination to continue the voyage, mutinied, and cast him adrift in a shallop, with eight others, on Midsummer Day 1611. The real ringleaders perished miserably in a scuffle with savages, and the survivors, after great suffering, reached England. See George Asher's *Henry Hudson, the Navigator* (Hakluyt Society, 1860); and books on him by Murphy (ed. Nijhoff, 1909) and Janvier (1909).

Hudson, WILLIAM HENRY, naturalist and prose-writer, was born 4th August 1841 at Quilmes, not far from Buenos Aires, son of a New Englander, grandson of a Devon man. He was educated at home by tutors; lived, but for visits to Buenos Aires, in the seclusion of estancias on the Pampas, in the closest intimacy with nature and the life of the gauchos, storing from his earliest years memories that were to pervade all his books. After an illness he came to England in 1869, married in 1876. Thereafter the struggle for existence was hard. Mrs Hudson's boarding-house was a failure. Only a few years before his death—18th August 1924—did the conditions of livelihood become easy, when their easiness was felt as ironical. Yet *The Naturalist in La Plata* (1892) and *Idle Days in Patagonia* (1893) were from the first recognised by readers of natural history as two of the best books of their kind. And the qualities visible in them—a mystic relation to nature, a clean prose-style of great beauty—gradually became visible to a wider circle in his studies of birds, his sketches of English village-life, in fiction and in imaginative essays upon trivial things. His books are many: it will be enough to name (of fiction) *El Ombú* (1902), *Green Mansions* (1904), *The Crystal Age* (1906); (of bird books) *British Birds* (1895), *Birds and Man* (1901), *Adventures among Birds* (1913); (of rural and village sketches) *The Land's End* (1908), *A Shepherd's Life* (1910). See, besides his autobiographical *Far Away and Long Ago* (1918), his *Letters* (1923), and *W. H. Hudson: A Portrait*, by Morley Roberts (1924).—He is not to be confused with a contemporary, WILLIAM HENRY HUDSON (1862-1918), lecturer on English literature, who published an introduction to the philosophy of Herbert Spencer, poems, studies of various poets, and books on Scott,

Rousseau, and Napoleon. He also wrote an *Outline History of English Literature* and *A Short History of French Literature* (1919; with memoir).

Hudson Bay, an inland sea, in the north-east of North America, is completely land-locked except on the north, where it is connected with the Arctic Ocean by Fox Channel and with the Atlantic Ocean by Hudson Strait, running 500 miles south-east. Including its south-eastern extension, James Bay (q.v.), it measures about 800 miles in length and 500 in average width, and has an area of some 450,000 sq. m. The eastern shore is for the most part rocky, and there are in this part of the bay chains of small islands; the western shore is generally flat. This sea, the great drainage reservoir of the Canadian North-west, receives the precipitation from over an area of nearly 3,000,000 sq. m., and has been appropriately called the Mediterranean of North America. It was discovered by Henry Hudson (q.v.) in 1610. Of the numerous rivers flowing into the bay, the principal are the Churchill, Nelson (bringing all the drainage of the Saskatchewan, Red, and Assiniboia Rivers through Lake Winnipeg), and Severn Rivers on the west; the Nastapoka, Little Whale, and Great Whale on the east; Big, East Main, Rupert, Nottaway, Moose (with its numerous tributaries), Albany, and Attawapiskat Rivers falling into James' Bay. The bay is seldom frozen more than a few miles from its shores, but the straits are sometimes beset by floes and bergs of ice, which render navigation rather difficult. Steamships can reach land through the straits from July to November. Seals, whales, and salmon abound in the bay, and whalers visit it during summer. The land south and west of James' Bay is suitable for cultivation, and minerals have been found; but the only business that has been developed is the fur-trade of the Hudson's Bay Company (q.v.), dating from the year 1670, though fish-oil has been exported. The islands blocking the mouth of the Hudson Bay (Southampton, Coats, and Mansel) were set apart by the Canadian Government in 1920 as grazing-grounds for musk oxen and reindeer, from which plentiful supplies of meat were expected. The winters are very severe, but the few months of summer are genial and bracing. A project has long been on foot for opening up direct communication between Britain and the grain-fields of the prairie West by steamers to Hudson Bay, and a railway from Fort Churchill or Port Nelson on the bay, to connect with the prairie railway systems, about 500 miles. This railway (from The Pas to Port Nelson), located by Dominion government engineers, was undertaken by that government in 1910, and partly built.

Hudson's Bay Company, a corporation formed in 1670 by Prince Rupert and seventeen noblemen and gentlemen for importing into Great Britain furs and skins got by barter from the Indians of North America. The company was invested with the absolute proprietorship and the exclusive right of traffic over an undefined territory, which, under the name of Rupert's Land, comprised all the regions discovered, or to be discovered, within the entrance of Hudson Strait. This was taken as meaning all lands that drained into Hudson Bay or Hudson Strait. For more than a century, however, the grantees confined themselves to the coast districts. Down to 1713 they had also to contend against the hostile acts of the French of Canada, who destroyed their forts, ruined their goods, and captured their ships. But after Canada passed from the French to the British in 1763 adventurers from the great lakes began to penetrate, in quest of peltry, far up the Saskatchewan towards the Rocky Mountains. And their enterprises, coming to be

prosecuted with more systematic energy, led in 1783 to the formation of the North-west Fur Company of Montreal. After a period of stubborn competition, the Hudson's Bay Company coalesced with its formidable opponent in 1821. The sphere of their labours was now practically coincident with all British North America, between the Pacific and Atlantic, and the Arctic Ocean and the United States. In 1838 the Hudson's Bay Company again acquired the sole right of trading for itself for a period of twenty-one years; on the expiry of this concession the fur trade in British North America was thrown open to the world. Finally, in 1869, the company made a formal cession to the British government of whatever territorial claims remained, receiving an indemnity of £300,000 from the Dominion of Canada, to which the whole territories were forthwith annexed. It was, however, stipulated that the company should retain all its forts, with 50,000 acres and one-twentieth of all the land lying within the 'fertile' belt from the Red River to the Rocky Mountains. Besides still carrying on the business of collecting furs, the company now derives a large income from the sale of these conceded lands and from general stores.

See Butler, *Great Lone Land* (1872), H. M. Robinson, *Great Fur Land* (N.Y. 1879), the History by Professor G. Bryce (1900); Beekles Willson, *The Great Company* (1900); Sir W. Schooling, *Hudson's Bay Company* (1920).

Hué, the capital of Annam, 10 miles from the mouth of the Hué River, or Truongtien. In 1801 it was strongly fortified by French officers. The heart of the city is occupied by the palace. Since before Annam became a French protectorate, there has been a French resident at Hué; and, since the treaty of Hué in 1884, a French garrison. Thuanan is the port of Hué. There is little industry in Hué, which has a population of 60,000 (with suburbs 100,000), including a number of Chinese. See ANNAM.

Hue and Cry, a phrase derived from the old process of pursuit with horn and voice, used in old English law to describe the pursuit of felons. Whoever arrested the person pursued was protected; and it was the duty of all persons to join in a hue and cry.—The *Hue and Cry*, a police gazette for advertising criminals, was established in 1710.

Hueffer, or FORD, FORD MADOX, son of Francis Hueffer (q.v.), was born 1873, studied at University College, London. Founder of the *English Review*, he has written some prose works of distinction—*The Soul of London* (1905), *The Heart of the Country* (1906)—some poetry of fine quality in *vers libre* (collected in 1914; *On Heaven*, 1918), stories, a Life of his grandfather, Madox Brown, monographs on his kinsman Rossetti and Henry James, *The Critical Attitude* (essays, 1911), and, with Joseph Conrad, *The Inheritors and Romance*.

Hueffer, FRANCIS, musical critic and Provençal scholar, was born at Münster, in Westphalia, in 1845, studied at Berlin, Leipzig, and Paris, and settled in London in 1869. He was musical critic of the *Times*, and was recognised as the champion in Britain of Wagner and Wagnerian music. In 1869 he edited the Provençal poet Guillem de Cabestanh, and in 1878 published *The Troubadours*. Two works on Wagner (1874; 1881) were from his pen. He died 19th January 1889. He married a daughter of Ford Madox Brown, and Ford Madox Hueffer (q.v.) is their son.

Huelva, a thriving town of Spain, situated near the confluence of the Odiel and the Tinto, 68 miles by rail WSW. of Seville. Fishing, chemical manufactures, and the plaiting of esparto grass

are the chief industries. Huelva is the port for the important Río Tinto copper-mines, in British hands, and a shipping place for wine. Copper ore, iron ore, manganese, and quicksilver are exported. Pop. 34,000.—The *province* of Huelva has an area of 4000 sq. m., and a pop. of 330,000.

Huerta, VICENTE GARCÍA DE LA, a Spanish poet and critic, was born in 1730 at Zafra, in Estremadura, but spent the greater part of his life in Madrid, where he was head of the Royal Library, and where he died on 12th March 1787. His tragedy of *Raquel* (1778), founded upon the story of the love of King Alfonso VIII. for the fair Jewess Rachel, was received with great enthusiasm, and is still esteemed one of the best of modern Spanish tragedies. Huerta was a zealous but not always consistent opponent of the prevailing Gallicism of his own day. As a lyric and dramatic poet he shows great command of language and versification. His poems were published in two volumes in 1778-79, and again in *Biblioteca de Autores Españoles* (vol. lxi.). Huerta edited the *Teatro Español* (17 vols. 1785-86), a collection of the best works of the older Spanish dramatists.

Huesca, a very old and picturesque town of Spain, on the Isuela, 55 miles by a branch railway N.E. of Saragossa. Among its chief buildings are the cathedral (1400-1515), a beautiful Gothic edifice; the Romanesque church of San Pedro (1150-1241); the university, founded in 1354 by Pedro IV.; and a former palace of the kings of Aragon. The *Oscia* of the Romans, where Sertorius was murdered in 72 B.C., Huesca afterwards became famous as a seat of learning. Tanning and manufactures of linens are here carried on to some extent. Pop. 14,000.—The *province* of Huesca has an area of 5848 sq. m., and a pop. of 250,000.

Hués-car, a town of Spain, 75 miles N.E. of Granada; pop. 9000.

Huet, PIERRE DANIEL, French scholar and polymath, was born at Caen, 8th February 1630. He was educated in the Jesuit school of Caen, and became a zealous pupil of Descartes and of Bochart. The latter he accompanied on a visit to Stockholm in 1652, when he discovered and transcribed the MS. of Origen which was the basis of his celebrated edition of that father fifteen years later. On his return home he gave himself up entirely to study. In 1661 he published his essay *De Interpretatione*. In 1670 he was appointed with Bossuet tutor of the dauphin, and in the same year wrote his *Essai sur l'Origine des Romains*. He took an active part also in preparing the Delphin edition of the classics. Having in 1676 taken holy orders, he was successively abbot of Aunay (1678), bishop of Soissons (1685) and Avranches (1692), and abbot of Fontenay (1699). In 1679 appeared one of his most important books, *Demonstratio Evangelica*. In 1701 he withdrew to the Jesuits' house in Paris, where he died, 26th January 1721. During his episcopal career Huet published a couple of books on the Cartesian philosophy, another on reason and faith, and another on the site of the earthly paradise. To his latest years belong *Histoire du Commerce et de la Navigation des Anciens* (1716), and his autobiographical memoirs (1718). His works were published in a collected form in 1712, and a volume of *Huetania* appeared in 1722. In this latter year Huet's *Traité de la Faiblesse de l'Esprit Humain*, which excited much controversy, first saw the light. See his Latin autobiography (1713), the French Life by Bartholomew (1850), and an article in the *Quarterly*, 1855.

Hufeland, CHRISTOPH WILHELM, German physician, was born on 12th August 1762 at Langensalza, in Thuringia. After studying at Jena and Göttingen, he was appointed physician

to the court of Weimar, where his father and his grandfather had previously filled the same office. In 1793 he was appointed professor of Medicine at Jena, and in 1798 went to Berlin to preside over the medical college there and the Charité Hospital. On the foundation of the university of Berlin in 1809 he became one of its professors. He died 25th August 1836. He founded a number of benevolent societies and institutions. Of his works the most notable were the famous *Makrobiotik*, or the art of prolonging life (1796), which was translated into almost all the languages of Europe; a work on the physical education of the young (1799); and *Enchiridion Medicum* (1836).

Hufeland, GOTTLIEB (1760-1816), born at Danzig, and sometime professor of Law at Göttingen, wrote important works on natural law, on German law, and on political economy—in the last mainly on the lines of Adam Smith.

Hufuf. See HOFHUF.

Hug, JOHANN LEONHARD, Catholic theologian, was born at Constance, 1st June 1765, entered into priest's orders in 1789, was appointed a professor of Theology at Freiburg in 1791, and died there, 11th March 1846. The most important fruit of his biblical researches was his *Introduction to the New Testament* (2 vols. 1808), which was translated into most European languages (Eng. by D. G. Wait, 1827).

Hügel, BARON FRIEDRICH VON (1852-1925), a distinguished Roman Catholic critic, was born at Florence, son of the Austrian ambassador, wrote *The Mystical Element in Religion* (1908-9; new ed. 1923), *Eternal Life* (1912-13), *Essays and Addresses* (1921), and other works.

Huggins, SIR WILLIAM, K.C.B. (1897), astronomer, was born in London on 7th February 1824. Whilst still a youth his mind was attracted to the study of chemistry, magnetism, and allied branches of physical science. In 1852 he was elected a member of the Microscopical Society, and for some years laboured at the study of physiology, animal and vegetable, with the microscope. But having in 1855 built for his own private use an observatory at Upper Tulse Hill, he began what proved to be the principal work of his lifetime—the study of the physical constitution of stars, planets, comets, and nebulae. In 1868 he saw that Doppler's Principle (q.v.) could be applied to the determination of the velocities of stars in the line of sight; and he set about the application of this method. By researches on the spectra of the sun and of certain comets, he ascertained that their luminous properties are not the same. From 1875 he busied himself in photographing the ultra-violet parts of the spectra of the stars, and he determined the amount of heat that reaches the earth from some of the fixed stars. He became President of the Royal Society in 1900, and was thrice awarded its medal and twice the gold medal of the Royal Astronomical Society, of which he was president, 1876-78. A collection of his scientific papers was being published at the time of his death, 12th May 1910.—His wife, MARGARET LINDSAY MURRAY (1848-1915), also an astronomer and spectroscopist, born in Dublin, collaborated with him.

Hugh, St, of Avalon, Bishop of Lincoln, was born of noble family at Avalon in Burgundy about 1135. On his mother's death his father entered a priory of regular canons at Villarbena, carrying with him the boy, then but eight years old. At nineteen he was ordained deacon, and was already remarkable for his holiness of life and ascetic austerity. Ere long he was attracted by the severer discipline of the Grande Chartreuse, and thither he repaired, although he had taken an oath to his superior not to do so. There he remained ten years, received his priest's orders, and was for his

practical ability appointed bursar to the monastery. His fame came to the ears of Henry II., who prevailed upon him to accept the government of the struggling Carthusian monastery at Witham in Somersetshire, and summoned him thence in May 1186 to fill the bishopric of Lincoln. For fourteen years he governed his diocese with great wisdom and vigour, retiring every year a short time to Witham for his soul's health. His unworldly holiness gave him great influence, not only over Henry II., but also his successors Richard and John. He did not leave off his frank outspokenness of speech and his quick wit even in the presence of the king. Withal his charity was so remarkable that even the Jews of Lincoln are said to have wept at his funeral. His pet swan's affection for him appeared to beholders to be more than natural. The swan usually appears in representations of the saint. Soon after his accession to the episcopal throne he had begun with vigour the rebuilding of his cathedral, and he lived to see the completion of the choir and eastern transepts. But indeed, with the exception of the presbytery, the entire church, as it now dominates Lincoln, was conceived in the mind of Hugh's architect, and gradually perfected under his successors. Hugh visited his native country in 1200, and on his return journey was seized with illness, and died at London 16th November 1200. He was canonised in 1220, and for long miracles were wrought at his tomb, and his cult was almost as popular as that of St Thomas in the south.

Both the *Metrical Life of St Hugh of Avalon* (1860) and the *Magna Vita S. Hugonis* (1864), the latter most likely written by his domestic chaplain, Adam, abbot of Evesham, were edited by the Rev. J. F. Dimock. A Life by Giraldus is printed in vol. vii. (1877) of the works of Giraldus Cambrensis. See also Canon Perry's *Life of St Hugh of Avalon* (1879).

Hugh Capet. See CAPET.

Hugh of Lincoln, a boy supposed to have been murdered by the Jews of Lincoln, as told both in English traditional ballads and early chronicles. Professor Child (No. 155) gives no fewer than eighteen versions of ballads on this theme, which agree marvellously even in detail. A group of boys playing at foot or at hand ball are joined by the young Hugh or Sir Hugh, who drives the ball through a Jew's window, is enticed into the house by the Jew's daughter, cruelly murdered and flung into a well, from which he speaks miraculously, whereby the murder is discovered. The story of Hugh of Lincoln is told in the *Annals of Waverley*, under the year 1255, by a contemporary writer. Here the boy is tortured by the Jews, and finally crucified in contempt of Christ. His body is discovered by miraculous means, and eighteen Jews are hanged for their share in the crime. Additional circumstances are found in Matthew Paris. The story occurs simultaneously in several Anglo-French ballads; and Chaucer's *Prioresses Tale* is an artistic elaboration of the theme. We find more or less circumstantial versions of the same story not only at Lincoln, but at Norwich, Gloucester, London, and Northampton; at Blois, at Saragossa, and Valladolid; at Prague and Cracow, Pavia and Venice, and in many German towns. Besides the desire to deride the Passion, an additional motive was invented, that the Jews sought to obtain blood for use in the Paschal rites. This monstrous notion has survived persistently for over 600 years, and has formed a pretext for cruel wrong down to our own day in Russia and Hungary.

See the Chaucer Society's *Originals and Analogues of Chaucer's Canterbury Tales* for 1875-76; Child's *English and Scottish Popular Ballads* (1888); and *The Life and*

Miracles of St William of Norwich, edited by Jessopp and James (1897).

Hugh of St Victor. See ST VICTOR.

Hugh of Wells, Bishop of Lincoln, was one of King John's councillors. See a book on him by Marson (1901).

Hughenden (locally *Hitchendon*), a parish of Buckinghamshire, among the Chiltern Hills, 2 miles N. of High Wycombe. Hughenden Manor was purchased before 1847 by Benjamin Disraeli, Earl of Beaconsfield, who is buried in a vault of the ancient parish church.

Hughes, CHARLES EVANS, born at Glen's Falls, N.Y., 11th April 1862, studied at Colgate, Brown, and Columbia universities. A distinguished career at the New York bar was interrupted in 1891-93 when he was professor of Law at Cornell. His conduct as counsel in investigations which showed up abuses led to his election as Governor of New York for two terms (1907-10). In 1910 he became an Associate Justice of the United States Supreme Court. As Republican candidate for the presidency he was defeated by Dr Woodrow Wilson in 1916. Secretary of State from 1921 to 1925, he presided at the Washington Conference, and at once proposed a scheme of naval disarmament.

Hughes, DAVID EDWARD (1831-1900), was born in London, educated in the United States, and professor of Natural Philosophy in Kentucky, invented the printing telegraph, the microphone, and the induction balance.

Hughes, HUGH PRICE (1847-92), born at Carmarthen, became a Wesleyan pastor in London, and a very conspicuous representative of the 'non-conformist conscience' in social reform. He contributed the article **WESLEY** to this Encyclopædia. See his *Life* by his daughter (1904).

Hughes, JOHN (1797-1864), born in County Tyrone, was day labourer in Maryland and Pennsylvania, but having qualified for priest's orders, became eminent as a Roman Catholic churchman and controversialist, and was successively bishop and archbishop (1850) of New York.

Hughes, THOMAS, born at Uffington, Berks, 19th October 1822, was educated at Rugby under Arnold; studied at Oriel, Oxford; graduated in 1845; and became a member of the Chancery Bar. In 1856 he gave to the world *Tom Brown's School-days*, a vivid and truthful picture of life at Rugby, evidently written from the author's own boyish impressions. It is the highest praise to say that it admirably supplements Stanley's life as a picture of the great teacher. It was followed in 1858 by *The Scouring of the White Horse*; in 1861 by *Tom Brown at Oxford*, in which the mental history of his hero is continued, with sketches of college life and incidents; and in 1869 by *Alfred the Great*. Hughes pursued meanwhile the practice of the law, became Q.C. in 1869, and a County Court judge in 1882. He associated early with Maurice and Kingsley in their work of social and sanitary reform among the London poor, and gained the confidence and good-will of the working-classes by his endeavours to promote a better understanding between masters and men, and by teaching the latter the value of co-operation. At the general election for Lambeth in 1865 he was placed at the head of the poll. He was returned for Frome in 1868, which he continued to represent till 1874, and always took a prominent part in debates relating to trade-unions and the like. In 1880 he assisted in founding a settlement in the United States, described in *Rugby, Tennessee* (1881). He also wrote *Memoirs of a Brother* (1873), *Lives of Daniel*

Macmillan (1882) and Bishop Fraser (1887), *Vacation Rumbles* (1895), and the article MAURICE in *Chambers's Encyclopædia*. He died 22d March 1896.

Hughes, WILLIAM MORRIS, born in Wales, 1864, was trained as a teacher, but went to Australia in 1884, worked in various occupations, and was admitted to the New South Wales bar. From 1894 he sat in Colonial and afterwards Commonwealth parliaments, and from 1915 was Federal Attorney-General and Prime Minister in Labour and Coalition governments. An ardent imperialist, he triumphed in the elections of 1917 and 1919; but his advocacy of compulsory military service lost him the leadership of the Labour party in 1917. He resigned in 1923.

Húgli, or HOOGHLY, a river of Bengal, the most westerly of the channels by which the Ganges reaches the sea, and commercially the most important. Taking its distinctive name near the town of Santipur, it has a southerly course of 64 miles to Calcutta, and a further course of 81 miles in the same direction to the Bay of Bengal. Being a deltaic river, the Húgli is much subject to being silted up, and is only kept open to navigation by the vigilant exertions of a special staff of river engineers. Even with all their care the stream is frequently dangerous, owing to shifting quicksands and moving banks and channels. In spite of these drawbacks vessels drawing 26 feet of water are safely taken up to Calcutta by the Calcutta pilots. At its mouth the Húgli has a width of 15 miles. The Bore (q.v.) of the river frequently attains a height of 7 vertical feet. See map at CALCUTTA.

Húgli, or HOOGHLY, a city of Bengal, capital of a district, stands on the right or western bank of the river Húgli, 25 miles by rail north of Calcutta. Pop. of Húgli, with Chinsura, immediately to the south, 30,000, mostly Hindus. Here is a college for English and Asiatic literature, founded by a Hindu.

Hugo, VICTOR-MARIE (1802-85), was the son of a Lorrainer and a Breton, and was born at Besançon. His father, General Hugo, was on active service, so that his earlier years were mostly spent in the track of the emperor's armies. He was educated partly in Paris at the Feuillantines (1809-11, 1813-15), partly in Madrid (1812), and partly at the École Polytechnique, where he read mathematics and practised poetry. At fourteen he produced a tragedy; at fifteen he went near to winning a prize at an Académie competition; and at twenty, when he published his first set of *Odes et Ballades* (1822), he had thrice been victor at the Floral Games of Toulouse. The next year, being by this time a married man and the *enfant sublime* of M. de Chateaubriand, he published his *Han d'Islande* (1823), that wild and whirling romance of an impossible Iceland; and followed it up with *Bug-Jargal* (1824), a second set of *Odes et Ballades* (1826), and the famous *Cromwell* (1827), thanks to which last—a tragedy even then impossible to act and now almost as difficult to read—he became the most conspicuous figure in æsthetic France. For Romanticism—that protest in action against the effete and hidebound conventions of the age of Louis XIV.—was now by way of being an accomplished fact; and the preface to *Cromwell* was greeted with an enthusiasm of approval on the one hand and of detestation on the other in these days not easy to understand. In its way, indeed, it is a document of singular importance in literary history. It is largely compacted of paradox and antithesis no doubt; and no doubt its premises are mostly dubious and its conclusions not more than

fantastic. But it asserted the artist's right to be as Shakespearian—that is, as lawless—as he pleased, and it was so completely a declaration of independence, and a decree of emancipation, that, whatever happens, the literature of France can never wholly recover from its effect.

The time indeed was big with revolution and with change, and Hugo's manifesto was accepted by the Romanticists with the solemnity of absolute conviction, so that he instantly took his place by right of genius and authority at the head of the literary host. He was fully equal to the charge of course; for while he was far and away the greatest artist in words that modern France has seen, he was also very careful and curious in the work of 'engineering a reputation,' and contrived to take himself and his function so seriously that to his followers he was not much below divinity itself. It is said that he made himself a forehead; and it is certain that while M. Rodin's magnificent bust of him is far less suggestive of Apollo than of Hercules, the Hugo brow—enormous, radiant, 'prone with excess of mind'—appears and reappears in contemporary caricature with all the persistency and more than the effect of Gillray's view of the 'Bottomless Pitt.' It is certain, too, that the first sketch of his life and work that got into print was written in his own house, and was the work of his own wife; and as Mme. Hugo never wrote again, it is legitimate to argue that the hero may very possibly have lent a hand to the epic. But he never ceased from achievement; and his achievement was inevitably that of a great artist in speech. In 1828 he published his *Orientales*, wherein he revealed himself for such a master of rhythms, such an inventor in style, such an adept in the mystery of the use of words as France had never seen. The year 1830 was the great year of *Hernani*—the first in fact and the second in time of those 'five-act lyrics' of which Hugo's drama is composed. In so far as it relates to drama—material, structure, amount, movement, the presentation of emotion in action—the question had been settled now and for all time by Dumas the year before; but Dumas was not a writer in the sense that Hugo was, and the battle of style was still to fight, and the battlefield was the Théâtre-Français, and the *casus belli* was *Hernani*. It is so brilliantly written, the movement of the verse is so victorious and the diction is so gorgeous, that even now it takes one time and patience and a certain familiarity to see that, while constructed in the formula of *Henri Trois et sa Cour*, it is no more a play than *Samson Agonistes*. In those days men had neither time nor patience, while as for familiarity! . . . It was enough that to one side the verse was incomparable, and that to another it was the Accursed Thing. As Hugo took care to pack as much of the house as he could get made over to him with Romantics, and as on the other part the Classicists were to the full as eager for the quarrel, the question of what is and what is not style was argued for many nights on end with a vehemence—sometimes attaining to the inspiration of assault and battery—which has made 1830, as the year of *Hernani*, a sacred date—as who should say a species of Hegira in the annals of Romanticism.

In 1831 Hugo published *Notre Dame de Paris*, a pretentious but picturesque and moving historical romance in which he enters into competition with Sir Walter and comes badly off, and *Les Feuilles d'Automne*, a sheaf of lyric and contemplative verse in which is included some of his best poetry; and brought out his best play, *Marion Delorme*, at the Théâtre-Français. In 1832 he produced *Le Roi s'amuse*, which was interdicted after the first

night, and of which the best that can be said is that it is superbly written and that it has gone the round of the world as *Rigoletto*. The next year was that of *Lucrèce Borgia* and *Marie Tudor*, the first a good and stirring melodrama, the second a farrago of unveracities of all kinds—moral, historical, dramatic, and the rest; in 1834 came *Claude Gueux*, which is pure humanitarian sentimentalism, and the *Littérature et Philosophie Mélangées*, a collection of juvenilia in prose, all carefully dated and all as carefully rewritten or revised. Followed in 1835 *Angelo*, a third melodrama in prose, and the admirable lyricism of *Les Chants du Crépuscule*; in 1836 *La Esmeralda* (an opera for Mdlle. Bertin); in 1837, *Les Voix Intérieures*, in which, as in *Les Feuilles d'Automne*, the poet's genius of diction is held by some to have found its noblest expression; in 1838, *Ruy Blas*, after *Hernani* the most famous of his stage rhapsodies; and in 1840, *Les Rayons et les Ombres*, yet another collection of brilliant and sonorous verse; after which the prodigious affluence of creativeness to which all those were due appears to have been momentarily exhausted. Certain it is that Hugo published no more until 1843, when he again failed at the Français with that ponderous trilogy of *Les Burgraves*, surcharged with as it were an Æschylean sentimentalism. His next essay in pure art was not put forth till 1856, the dozen or fifteen years between being very largely given over to the pursuit of politics and the practice of oratory, journalism, and pamphleteering in prose and verse.

Putting it roughly, Hugo was until 1830 a Royalist, and worshipped Napoleon; and between 1830 and 1848 he was a Napoleonist with a turn for humanitarianism, but more or less resolute in the cause of order and law. In this latter capacity it was that he sat for the city of Paris in the Assemblée Constituante. There he voted now with the Right and now with the Left, so that, when on his election to the Assemblée Législative he threw in his lot with the democratic republicans, the reproach of apostasy was by no means unfounded. It is not clear that he would have been finally content with any change in the condition of things at this time—always excepting such a turn of the wheel as would have brought himself to the top and kept him there as a kind of emperor by the grace of genius and the democracy. But it is plain that he was bitterly dissatisfied with things as they were, including the eminence of Montalembert and the popularity of the prince-president. In 1852, after the *coup d'état*, he withdrew to Brussels; but, being ejected, went first to Jersey, and then settled in Guernsey, whence he issued his *Napoléon le Petit*, perhaps the most mannered and the least literary of all his works, and in 1853 *Les Châtiments*, which is certainly the greatest achievement in the fusion of pure poetry with political and personal satire in all literature. Three years after appeared *Les Contemplations*, a gathering of poems elegiacal, reflective, and lyrical, remarkable for beauty of expression and comparative simplicity of style; and three years after that the wonderful and often bewildering *Légende des Siècles* (1859). Still another silence of three years was broken by the publication (in ten languages) of *Les Misérables* (1862), a panoramic romance of modern life, mannered beyond measure in style and abounding in absurdities and *longueurs*, but including also not a little of Hugo's sincerest and most touching invention and achievement; and this in its turn was followed by the extraordinary rhapsody called *William Shakespeare* (1864), and by *Les Chansons des Rues et des Bois* (1865), a book of verses which is at the same time a little gallery of achievements in style; by *Les Travailleurs de la Mer*, an

idyll of passion, adventure, and self-sacrifice; by *L'Homme qui Rit*, a piece of fiction whose purpose and tenor are intended to be historical, and whose effect is sometimes to overwhelm the reader, often to weary him, and still more often to amuse. Returning to Paris after the Fourth of September, Hugo at once distinguished himself by summoning the Germans to withdraw from France and proclaim the German Republic. Some five or six months after he was chosen to represent the Seine, but soon resigned his seat on the ground that one of his speeches was interrupted by the Right. He stayed on through the rule of the Commune, and defended the Vendôme Column while he could; and then, departing for Brussels, he protested publicly against the action of the Belgian government in respect of the beaten Communists, the effects of which proceeding were that the populace rose against him, and that he was expelled the kingdom. Again he stood for Paris, but was beaten by a majority of 27,000 on a register of 231,000. In 1872 he published *L'Année Terrible*, a series of pictures of the war, diatribes against Germany, and eulogies of France, which are often eloquent and are sometimes poetry; in 1874 his last romance in prose, the much-debated *Quatre-Vingt-Treize*; in 1875-76 a complete collection of his speeches and addresses. In 1876 he was made a senator, and published the second part of the *Légende*; 1877 was the year of the *Histoire d'un Crime*, which has been fairly enough described as 'the apotheosis of the Special Correspondent,' and of *L'Art d'être Grand-père*, wherein, with much charming verse, are good store of conceits and no small amount of what some one has called 'the pedantry of sentimentalism.' 1878 and 1879 enriched us with *Le Pape*—a piece humanitarian, anti-clerical, and above all theatrical, which they may praise who can—and *La Pitié Suprême*, the effect of which is much the same, and which—like *L'Ane* (1880), and a great deal of *Les Quatre Vents de l'Esprit* (1881), and *Torquemada* (1882)—is merely Hugo in decay. His mastery of words remains invariable, his accomplishment is always superb; but all too frequently he produces antithesis under the delusion that he is expressing ideas, he parades all manner of affectations with the air of one reviewing a Tenth Legion or Old Guard (so to speak) of the sentiments, he continually mistakes preposterousness for grandeur; he falls a prey to any of the eternal unveracities he may chance to encounter; his 'philosophy' is a mere effect of appetite, and as always his depressing lack of humour is 'not merely zero, but even a frightful minus quantity,' so that he abides in error with a seriousness ridiculous indeed. But genius is always genius, and temperament never ceases from being temperament; and the final impression is one of unsurpassed accomplishment and abounding mental and emotional activity. So that Hugo died the foremost man of letters of his time (22d May 1885), and they were few indeed who grudged him the public funeral with which he was dignified, and in which the pauper's hearse that bore him tombwards—(the invention was wholly his own)—was followed by the best and the worst of living France.

Hugo's work is vitiated as an expression of life by the presence of an abounding insincerity in combination with a quality of self-sufficiency so inordinate as scarce to be distinguished now and then from an immense stupidity. In truth he does but seem to create: his personages—Cimourdain, Josiane, Didier, Ursus, Ruy Gomez de Silva, Claude Frollo, Lanténac, Lucrèce Borgia, Javert, and Myriel, the very *pieuvre* of *Les Travailleurs de la Mer*, are all expressions not of humanity but of Victor Hugo. You would believe in them—and in him—

if you could; but you cannot, for he takes care to make belief impossible. His plays are sometimes well made, are always heavily decorated, are all magnificently written, and have all had their chance of immortality. But their author is Victor Hugo, and the situations are abnormal, the personages peculiar, the interests remote from experience, and such motive as is developed is too individual and strange to be felt beyond the footlights. Much the same is true of his prose romance; but while the level of style is nothing like so high as in the plays, it has merits—of invention, pathos and terror, presentation—absent from these, and which made him one of the most popular writers of his epoch. That said, it may be added that to talk of Hugo as either a dramatist or a master of romantic fiction is to beg the question of Hugo's greatness. His prose, as prose, has never the easy, voluptuous, natural eloquence of George Sand's, nor the mordant felicity of Mérimée's, nor the spontaneity and vivacity of Dumas's, nor the terrible yet irresistible persuasiveness of the opening chapters of Musset's *Confession d'un Enfant du Siècle*. His dramas are only so many lyrical expressions of Hugolatry, the work of the arch-Hugolater. His best and truest title to immortality is his poetry. In truth, the range and the capacity of his genius in rhythm and rhyme are unparalleled in the literature of France. It was for Musset to utter the truest note, and to make the invention speak the very language of the heart; it has been for Leconte de Lisle, for Baudelaire, for Gautier to produce impeccable work each after his kind; but assuredly it was for Hugo to accomplish the most gorgeous and the most heroic achievement in the divine art of song. His verse, with its infinite capacity of violence and calm, sunshine and thunder, apocalyptic fury and grace ineffable, has something of the effect of the multitudinous seas as he saw and described them from his eyrie in midchannel. The effect of his alexandrines, with their wealth of colour and light and energy, may fairly be paralleled with that of Shakespeare's iambs; while in their purity of form, the sweetness and distinction of their cadences, their richness of rhyme, their magical felicity of expression, his lyrical measures put the Pleiad and all its works to shame. There can be no possible doubt that in many of the relations of life Hugo was a *poseur* of the first magnitude—that from the first he humbugged his contemporaries with a pertinacity and a success that are only equalled by his faculty of taking himself seriously. But there can be as little that while essentially un-French—a combination, indeed, of Teuton and Celt, and moreover absolutely lacking in sanity—he was a lyrist of the first order, a master of words and cadences, an artist in rhythms and rhymes.

See *Victor Hugo raconté par un Témoin de sa Vie* (1863) by his wife, who died at Brussels in 1868; works on him by Rivel (1878), Paul de Saint Victor (1885), Barbou (1881), Asseline (1885), Biré (three mainly hostile books), Dupuy (two books), Mabilleau, Boudon, Renouvier (1893), Swinburne (1886), J. P. Nichol (1892), Stapfer (1901), Claretie (1902), Brunetière (1903), A. F. Davidson (1912), Schéa (1912), Mme. Duclaux (1921); and criticisms by Gautier, Banville, Baudelaire, and Sainte-Beuve.—His son Charles (1826–71), publicist and novelist, was the father of the 'George' and 'Jeanne' of *L'Art d'être Grand-père*; François (1828–73) trans. Shakespeare.

Huguenots (from the Genevese nickname *eiguenot*, Ger. *eidgenosse*), the name formerly given in France to the adherents of the Reformation, which movement commenced almost simultaneously in France and Germany. One of the most eminent names in the early history of French Protestantism is that of Farel (q.v.), and one of the first supporters of its cause was Margaret of Valois, queen of

Navarre, the sister of Francis I. Subsequently, in the time of Calvin, many of the nobles and middle classes embraced the reformed religion. Francis I., however, opposed it with great severity, and caused many to be burned as heretics. The alliance of Henry II. with the German Protestants gave at first an impulse to the cause of the Reformation, but the aspect of things was again changed when the family of Guise obtained ascendancy at court. Under Francis II. a chamber (*chambre ardente*) was established in each parliament for the punishment of Protestants; and executions, confiscations, and banishments were common in all parts of the kingdom. The Protestants took up arms against the government, choosing Louis I., Prince of Bourbon-Condé, for their leader. On February 1, 1560, in a meeting at Nantes, they resolved to petition the king for freedom of religion and for the removal of the Guises; and in the event of his refusal, to seize the king's person, and proclaim Condé governor-general of the kingdom. But the court, being apprised of the conspiracy, fled from Blois to Amboise, and the Duke of Guise was appointed governor-general. Some bands of Protestants, approaching Amboise with weapons in their hands, were easily defeated and taken; 1200 died by the hand of the executioner. The Edict of Romorantin, in May 1560, took the prosecution of heretics out of the hands of the parliament, and gave it into those of the bishops. Whilst the Guises plotted the death of the Protestant leaders Charles IX. ascended the throne, a prince not yet of age; and the queen-mother, Catharine de' Medici (q.v.), having removed the Guises from the helm of the state, was compelled to seek the support of the Protestants against them and their party. In July 1561 appeared an edict which freed the Huguenots from the penalty of death. For the complete termination of strife the court opened a religious conference at Poissy. The chief disputants were the Cardinal of Lorraine on the one side, and Theodore Beza (q.v.) on the other. The effect of the discussion was to unite and embolden the Protestants, with whom the machinations of the Guises forced Catharine into closer alliance. In 1562 appeared an edict giving noblemen the right of the free exercise of their religion on their own estates.

In March of the same year, a company of Protestants met in a barn at Vassy for religious exercises was attacked, and many of them were massacred by the followers of the Duke of Guise. On this Condé hastened to Orleans, and called his co-religionists again to his standard; whilst the Guises took possession of the persons of the king and his mother, and proclaimed the Protestants rebels. In September the royal troops took Rouen, and in December a battle was fought at Dreux, in which, after a hard struggle, the Protestants were defeated. The Duke of Guise marched on Orleans, but was assassinated in his camp before that city, February 18, 1563. Hereupon the queen-mother hastened to conclude the peace of Amboise, by which the Protestants were allowed the free exercise of their religion, except in certain districts and towns. Catharine, however, formed a close alliance with the Spaniards for the extirpation of heresy, retrenched the new liberties of the Protestants, and made attempts upon the life of Condé and of the Admiral Coligny (q.v.). These leaders of the Protestant party adopted the resolution of taking possession of the king's person. The court fled to Paris, which Condé invested; but in November 1567 a battle was fought at St Denis between Condé and the Constable Montmorency, in consequence of which Condé fell back into Lorraine; and in March 1568 Catharine concluded peace at Longjumeau. Nevertheless she persecuted the

Protestants, of whom 3000 were assassinated or executed. The Protestants having, however, received assistance in troops from Germany, and in money and artillery from England, began the third religious war. But on March 13, 1569, they were defeated, and Condé their leader slain, at Jarnac by the royal troops under the Duke of Anjou, afterwards Henry III. Jeanne d'Albret, queen of Navarre, endeavoured to reanimate the Protestants, and set up her son, afterwards Henry IV., as the head of the Protestant cause. Coligny having received further assistance of troops from Germany, laid siege to Poitiers, but was again defeated by the Duke of Anjou at Moncontour. Fresh reinforcements from England, Switzerland, and Germany enabled Coligny to take Nîmes in 1569, and to relieve La Rochelle, whilst Lanoue obtained a victory over the royal troops at Luçon. Catharine and her son now sought for peace; and a treaty, concluded at St Germain-en-Laye in August 1570, gave to the Protestants an amnesty, the free exercise of their religion everywhere except in Paris, and the possession of a number of places of security.

Catharine, having failed to overthrow the Protestant cause in the open field, sought to accomplish her object by treachery; and by a general massacre of Protestants on St Bartholomew's Day (q.v.) 1572, 30,000 Huguenots were slain within two months in Paris and in the provinces. Although deprived of their leaders, and weakened by the slaughter of great numbers of their best and bravest, the Protestants flew to arms. The Duke of Anjou, after having lost his army before La Rochelle, took advantage of his election to the throne of Poland, and in 1573 concluded a peace by which the Protestants obtained the free exercise of their religion in their places of security, Montauban, Nîmes, and La Rochelle. A section of the Roman Catholic nobility, at whose head was the Duke of Alençon, the youngest son of Catharine, from purely political motives united with the Protestants in opposition to the queen-mother and the Guises. Catharine, therefore, incited her third son, now Henry III., immediately to recommence hostilities against the Protestants. But, contrary to all expectation, the Protestant cause was in the highest degree prosperous during the year 1573. A peace was concluded at Beaulieu by which the Protestants were freed from all restrictions in the exercise of their religion, and obtained eight new places of security. The Duke of Guise originated a Catholic association, called the Holy League, at the head of which the king put himself in the Assembly of the States at Blois in 1576, and the sixth religious war began. Peace was, however, again concluded by the king himself at Bergerac, in 1577, on the former conditions; and Catharine, to diminish the power of the Duke of Guise, entered into a private treaty with Henry of Navarre. The terms of peace being violated by the court, Henry I., Prince of Condé, son of Louis I., commenced the seventh religious war (called the *guerre des amoureux*) in November 1579; but he and his colleague Henry of Navarre being vanquished, peace was concluded at Fleix, November 1580.

There was now a comparatively long interval of repose till 1584, when, by the death of the Duke of Anjou (formerly of Alençon), Henry of Navarre became heir to the throne of France. Hereupon Henry, Duke of Guise, exerted himself for the revival of the League, entered into an alliance with Spain and the pope for the extirpation of heresy, declared the Cardinal of Bourbon heir to the throne, and began hostilities against the Protestants. This war is commonly known as the 'war of the three Henries.' The king soon made terms with Guise,

and declared all the privileges of the Protestants to be forfeited. The Protestants, having obtained troops from Germany and money from England, entered on the eighth religious war, Henry of Navarre commanding the Protestant army. The Duke of Guise, in the midst of these troubles, grasped the whole power of the state. But his designs with regard to the throne having become very evident, the king caused him and his brother the cardinal to be assassinated at the Assembly of the States at Blois in September 1588. In less than a year the king was himself assassinated by a monk named Jacques Clément, and Henry of Navarre succeeded to the throne, and signed the famous Edict of Nantes (see NANTES) on 13th April 1598.

Under the reign of Henry IV. the Protestants lived in tranquillity. But when, during the minority of Louis XIII., Mary de Medici, the queen of Henry IV., assumed the reins of government, the marriage treaties with the Spanish court excited the apprehensions of the Protestants to such a degree that in November 1615 the Prince of Condé set up the standard of rebellion. In spite of the treaty of Loudun (1616), in June 1617 a royal edict commanded the entire suppression at once of the Protestant Church and of political privileges in the province of Béarn; an edict not carried into full effect till 1620. Hostilities again broke out in May 1621. At the head of the Protestants were the two brothers, the Duke of Rohan and the Prince Soubise. Their cause, however, was feebly maintained; and after the capitulation of Montpellier, 21st October 1622, there followed a general peace, by which the Edict of Nantes was confirmed, but the right of prohibiting the assemblies of the Protestants was assumed on the part of the crown. The court, however, paid little attention to the treaty, and the Protestants again rose in arms. Soubise, with a fleet furnished by the town of La Rochelle, often more than once defeated the weak royal navy; and Cardinal Richelieu (q.v.) resolved upon the capture of La Rochelle. This he accomplished after a heroic resistance by the inhabitants. The fall of La Rochelle was speedily followed by that of Nîmes, Montauban, Castres, and all the other Protestant strongholds. Now left defenceless, and bereft of all political power, the Protestants were entirely dependent on the will of the court, which, however, made no attempt to deprive them of their liberty of conscience. It was Louis XIV. who, at the instigation of Madame de Maintenon and his confessor Lachaise, commenced anew the persecution of the Protestants, gradually deprived them of their equal civil rights, and endeavoured to put down the Protestant Church altogether. Bodies of troops, accompanied by monks, passed through the southern provinces, compelling the inhabitants to renounce their religion, demolishing the places of worship, and putting to death the preachers (see DRAGONADES). Fénelon was conspicuous for his zeal in seeking the conversion of Protestants. Hundreds of thousands fled to Switzerland, the Netherlands, England, and Germany. Many Protestants also made an insincere profession of Roman Catholicism. On 23d October 1685 Louis at last revoked the Edict of Nantes. Hereupon began a new flight, followed by a still more fearful persecution of the Protestants. Their marriages were declared null; their children deprived of the right of inheritance, and forcibly shut up in convents; their preachers indiscriminately put to death. From the vicinity of Nîmes, where they had always been very numerous, thousands betook themselves to the mountains of the Cévennes, and continued the exercise of their religion in secret. Amongst these and the mountaineers of the Cévennes a remarkable

fanatical enthusiasm displayed itself, and, under the name of Camisards (q.v.), they maintained for a number of years a wonderfully successful opposition to the forces of the great monarchy. The War of the Cévennes, or Camisard War, was not terminated till 1706, the suppression of the local rebellion being attended with circumstances of great cruelty. France lost in twenty years more than half a million of her most active, enterprising, and industrious citizens; and, notwithstanding all the persecutions, about two millions continued to adhere to the Protestant religion.

The partial repose which the Protestants enjoyed for more than ten years was attended by a revival of their worship, especially in Provence and Dauphiné. In 1724, therefore, Louis XV., at the instigation of the Jesuits, issued a severe edict against them. The spirit of the age, however, now began to be opposed to persecution. An edict of 1752 declared marriages and baptisms by Protestant ministers to be null, and required the repetition of them by the Roman Catholic clergy. But when, upon this, many began again to flee from their country, the disgust of the Roman Catholics themselves was so much excited that the court recalled the edict. Montesquieu successfully advocated the cause of toleration; Voltaire did much to promote it by his exposure of the judicial murder of John Calas (q.v.). At last, by an edict in 1787, which indeed was not registered by the parliament till 1789, Louis XVI. declared the Protestant marriages and baptisms to be valid, and restored to the Protestants equal civil rights, except that they might not be advanced to public offices and dignities. Even in 1789 a proposal for the complete emancipation of the Protestants was rejected by the National Assembly, which, however, admitted Protestants, and even Protestant preachers, as members without objection; and in 1790 it passed a decree for the restitution of all the properties of non-Catholics confiscated since the time of Louis XIV. The *Code Napoléon* gave Protestants in France equal civil and political rights with Roman Catholics. The charter granted by the Bourbons acknowledged the freedom of Protestant worship, and the state pledged itself for the maintenance of the pastors; yet under the government of the Restoration the privileges of Protestants were in many ways circumscribed. After the revolution of July 1830 the Reformed Charter of France proclaimed universal freedom of conscience and of worship, which principle has been maintained in subsequent changes. Protestants were no longer subjected to many exceptional hardships, and in various important instances were protected by Napoleon III. from the arbitrary exercise of power attempted by illiberal local magistrates adverse to their religion. But the *recognised* Protestant Church—including both Reformed and Lutherans—of which the pastors received till 1905 small salaries from the state, was not till 1872 permitted to hold synods or general assemblies or to proselytise. At a synod held in that year the conservative party in the church, in spite of some opposition, carried their proposal that the church, which had long been without a formally binding creed, should adopt an evangelical confession.

The first Huguenot churches in England date from the 16th century, as also the introduction of the Huguenot industries, such as the woollen, worsted, and nappy trades, silk-weaving, tapestry, dyeing, glass-making, pottery, and paper-making. Under Charles II. the Savoy in London was granted to the Huguenots as a place of worship, a fashionable West-end church, in which, as a token of 'conformity,' the Common Prayer-book was read in French. From 1685 onwards thousands and

thousands of Huguenots found their way to England, and gave William of Orange the support of their military talent, political interest, and financial resources. The planting of Protestantism in Ireland was greatly due to the services of the Huguenots Schomberg and Ruigny. Under Queen Anne there were thirty Huguenot churches in London alone. Towards the close of the century more than half had disappeared through the rapid absorption of the Huguenot families in the Anglican Church, and their rise to the first ranks in the gentry of England. Members of the Saurin family sat among the bishops, the son of Peter Allix became dean of Ely, the son of Casaubon was rector of Ickham, the families of Chenevix and Trench gave archbishops to Dublin and Tuam, and that of Romaine clergymen to London. Cavalier and Ligonier served under the British flag, Romilly adorned English law, the Martineaus shone in English letters; the Beauforts, Boileaus, Bosanquets, Bourdillons, Cazenoves, De Crespiagnys, De Villiers, Du Canes, Gossets, Layards, Millais are only a few instances taken at random out of several hundred family names of Huguenot origin.

M. Baird, *Rise of the Huguenots* (1880), and a series of three other works on their history (1885-95); R. L. Poole, *The Huguenots of the Dispersion* (1890); *Bulletin de l'Histoire du Protestantisme Français*; Transactions and publications of the Huguenot Society of London, established in 1885. See also the articles FRANCE, MAROT, HENRY IV., FLORIDA, &c.

Huia-bird (*Heteralocha acutirostris*), a remarkable New Zealand starling, now restricted to a few wooded and mountainous regions. The plumage is black, except on the white tips of the tail feathers; there is a wattle at the corner of the mouth; the bill of the female is strikingly different from that of her mate, being long, much curved, and pliant, instead of straight and strong as in the male. The difference is so marked that the two sexes were formerly referred to distinct species. In digging grubs out of wood the two kinds of bills supplement one another. The birds, which are becoming rare, submit readily to captivity.

Huitzilopochtli, the chief deity of the ancient Mexicans. The son of Coatlicue the earth-mother, he was recognised especially as the god of war and the sun-god (as such the promoter of growth). A cloak of humming-bird feathers was his insignia, and his image, striped blue and yellow, was seated on a blue bench, representing the heavens, while he held a snake rod in one hand and a shield with five feather tufts in the form of a cross in the other. His festival was celebrated at the winter solstice, and the general character of his worship was blood-thirsty in the extreme, human sacrifice being a necessary and integral part.

Hulagu, or HULAKU, Mongol conqueror of Bagdad, was a brother of Kublai Khan (q.v.). See MONGOLS.

Hulda, or HOLDA. See BERCHTA.

Hulks. See PRISONS.

Hull, or KINGSTON-ON-HULL, an important and flourishing English river-port, a parliamentary and municipal borough, city (1897; with a lord mayor, 1914), and county of itself, in the East Riding of Yorkshire, in a low, level plain on the north bank of the Humber, here 2 miles wide, and here joined by the Hull, 42 miles ESE. of York and 173 N. of London. Of churches the most notable are Holy Trinity, Decorated and Perpendicular in style, with a central tower 140 feet high; and St Mary's

Lowgate (1333), one-half of which was removed to make room for the mansion-house of Henry VIII., who stayed here in 1540. Both were restored by Sir G. G. Scott. All Saints' Church (1869), from designs of Street, is a good example of a brick church. The most important educational establishments are Girls' High School (formerly Hull and East Riding College); the Hull grammar-school (1486), where Andrew Marvell was educated; Hymers College (1889); and Trinity House School (1716), where a large number of boys receive a nautical education; to which may be added the Literary and Philosophical Society and the Royal Institution. An equestrian statue (1734) of William III. is conspicuous, and there are statues of Queen Victoria, Prince Albert, Dr Alderson, Sir Michael de la Pole, Andrew Marvell, and Wilberforce. Mason the poet was a native. Of benevolent establishments, the Trinity House, instituted in 1369, but rebuilt in 1753, for the relief of decayed seamen, and the Charterhouse (rebuilt 1645), an endowed institution for the poor, are the most worthy of note. There are four prettily laid out public parks and a botanic garden. A city-hall and art galleries were built in 1909-10. There are also a guild-hall, museums, exchanges, customs-house, gaol, post-office, theatres, dock-office, public baths, crematory, destructor, market-hall, and the Reckitt Free Library (1889), with branches.

The docks and basins, comprising an area of upwards of 200 acres, have been constructed since 1774. The Victoria Dock (1850-64) covers 20 acres, exclusive of two large timber ponds and tidal basins which contain an area of about 9 acres; it partly occupies the site of an old citadel with a battery of twenty-one guns, which till 1864 commanded the entrance of Hull Roads and the Humber. The Albert Dock (24½ acres) was opened in 1869; the Alexandra Dock (now 53½ acres) in 1883, on the same day as the Hull and Barnsley Railway; and the King George Dock (53 acres) in 1914. There are elaborate arrangements for handling coal and oil. Hull was one of the first ports in England to engage in the whale-fishery, an enterprise which has been abandoned; but its fisheries for edible fish employ, in conjunction with those of Grimsby, large fleets of boats. Hull is the great outlet for the woollen and cotton goods of the Midland counties, with which it has direct communication, by means of railway, river, or canal. It is the chief entrepôt for German and Scandinavian overseas trade, and it has steam communication with New York and Boston, Australia, and India. Besides woollens and cottons, it exports coal, oil, machinery; and imports cattle, grain, timber, iron, wool, flax, hemp, tallow, pitch, butter, and fruit. There are tanneries, breweries, oil-mills, iron shipbuilding yards, engineering works, manufactures of ropes, canvas, and sails, chains, cables, machinery, chemicals, 'colours, oil-cake, cement, and starch. The port is under the same administration as Goole (q.v.), and there is a steam ferry to New Holland on the other side of the Humber. Constituted the free borough of Kingston-on-Hull by Edward I. in 1299, the town owed much to its great merchant-house, the De la Poles, whose head, Michael, in 1385 was created Earl of Suffolk. In 1642 the refusal of its governor, Sir John Hotham, to admit Charles within its walls marked the outbreak of the Civil War, during which Hull was twice besieged by the royalists. It was made the seat of a suffragan bishop in 1534, and again in 1891. From 1885 Hull returned three instead of two members to parliament; from 1918 four. The electric lighting and tramways are in the hands of the municipal authorities. Pop. (1851) 84,690; (1881) 165,690; (1901, as extended in 1897) 240,259; (1921) 287,013.

See local works by Gent (1735; new ed. 1869), Frost (1827), Symons (1862), Sheahan (1864), Tindall Wildridge (1888), Franks and Newham (1907).

Hull, the chief town of Ottawa county, Quebec, is on the Ottawa River, opposite Ottawa (q.v.), with which it is connected by three bridges. It was almost wholly burnt down in 1900. For its sawmills, paper-mills, &c., it has abundant water-power in the Chaudière Falls. Pop. (1881) 6890; (1901) 13,990; (1921) 43,541.

Hull, EDWARD, F.R.S. (1829-1917), born in Antrim, served on the Geological Survey, and was professor of Geology in the Royal College of Science. He conducted a scientific exploration of Palestine and Arabia Petrea, and wrote largely on geology. He contributed part of the article PALESTINE to a former edition of this Encyclopædia. See his *Reminiscences* (1910).

Hull, WILLIAM, general, was born at Derby, Connecticut, in 1753, fought in the war of independence, and governed Michigan territory in 1805-12. In 1812 he was sent with an ill-found army of 1500 men to defend Detroit; there he was left without supplies, shut in by British and Indians, and ultimately compelled to surrender. The government needed a scapegoat, and Hull was tried by court-martial and sentenced to be shot. The sentence, however, was never carried out, and he died on his farm at Newton, Massachusetts, in 1825.

His nephew, ISAAC HULL, naval officer, was born at Derby, Connecticut, 9th March 1773, became a cabin-boy at fourteen, rose to the command of a ship in the West Indian trade, and in 1798 entered the newly-established American navy as a fourth-lieutenant. He was appointed to the *Constitution* frigate, which he commanded as captain from 1806. Hull was an able seaman, and in July 1812 his skill in sailing his ship enabled him to escape from an English squadron, after a pursuit of three days and nights. On 19th August of the same year he captured the British frigate *Guerrière*, forty-four guns, after a close action of thirty minutes; the *Constitution* losing fourteen killed and wounded, the *Guerrière* seventy-nine. The *Guerrière* was so injured that she had to be burned; while Hull's frigate escaped with such slight damage as to gain for her the name of 'Old Ironsides.' Hull received a medal from congress, swords of honour, and the freedom of several cities. He afterwards commanded squadrons in the Mediterranean and Pacific, retired in 1841, and died in Philadelphia, 13th February 1843. See the *Life* by General James Grant Wilson (New York, 1889).

Hullah, JOHN PYKE, the pioneer of music for the people, was born at Worcester, 27th June 1812. He studied at the Royal Academy of Music, and in 1836 composed *The Village Coquettes* to Charles Dickens's libretto. In 1841 he began popular singing-classes in Exeter Hall, London, in which, during a course of twenty years' teaching, he trained thousands to use their voices in singing. He was for several years professor of Vocal Music in King's College, and taught at other schools and colleges in the metropolis; and from 1872 to 1882 was musical inspector of training-schools for the United Kingdom. Hullah, who followed a modification of Wilhem's system, had little sympathy with contemporary developments of music, and opposed the 'Tonic Sol-fa' method. He published amongst other works a *History of Modern Music* (1862) and *The Third Period of Musical History* (1865). Of his songs, 'The Three Fishers' and 'The Storm' attained wide popularity. He died in London, 21st February 1884. See the *Life* by his wife (1886).

Hulsean Lectures, &c. The Rev. John Hulse, born at Middlewich, Cheshire, in 1708, educated at St John's College, Cambridge, and died in 1789, bequeathed his property to the university, for the founding of two divinity scholarships in St John's College, the Hulsean Prize, the office of Christian Advocate (in 1860 changed into the Hulsean Professorship of Divinity), and that of Hulsean Lecturer or Christian Preacher. The lecturer, appointed annually, must deliver at least four lectures before the university, although the number required was originally twenty, afterwards reduced to eight, and since 1860 to four. The subjects are 'the Evidence for Revealed Religion; the Truth and Excellence of Christianity; Prophecies and Miracles; Direct or Collateral Proofs of the Christian Religion, especially the Collateral Arguments; the most difficult Texts or Obscure Parts of Holy Scripture.' Among the lecturers have been Trench, Christopher Wordsworth, Ellicott, Howson, Farrar, E. A. Abbott, Boyd Carpenter, Barry, Cheetham, and Chase.

Humane Society, THE ROYAL, was founded (1774) by Dr Hawes and thirty-three others, in London, for the purpose of resuscitating those who had been immersed in water and were apparently drowned. At the present time it distributes rewards, consisting of medals, clasps, testimonials, and sums of money, to those who save or attempt to save life from drowning. Also 'all cases of exceptional bravery in rescuing or attempting to rescue persons from asphyxia in mines, wells, blast-furnaces, or in sewers where foul gas may endanger life, are recognisable by the society.' It likewise gives prizes for swimming to the pupils of public schools and of training-ships. Boats and boatmen

Medal of the Royal Humane Society
(actual size 1½ inch diameter).

are kept on the Serpentine in Hyde Park for the purpose of watching over the bathers who resort thither. And during the skating season experienced icemen are sent to the various waters in and around London to help in case of accidents. The society is supported by bequests and private subscriptions. Since 1873 the Stanhope gold medal has been awarded 'to the case exhibiting greatest gallantry during the year.' The figure shows the medal of the society. Another reverse is used when it is presented to persons who have risked their lives to save others, but without success; the inscription is 'VITA PERICULO EXPOSITA DONO DEDIT SOCIETAS REGIA HUMANA.' See *Annual Report of the Royal Humane Society*.

Humanists (Lat. *litteræ humaniores*, 'polite letters'—whence the title *Humanity* for the professorship of Latin in Scottish universities; Ital. *umanista*), the name assumed at the revival of learning by those who looked upon the cultivation of classical literature as the most valuable instru-

ment of education, in opposition to those who clung to the ancient methods of the Scholastics (q.v.). In their modes of thought also the tendency of the humanists was to exalt Paganism at the expense of Christianity. In the 18th century the name became a word of reproach for those who showed a blind zeal for the classics as the sole educational subject, opposing the Philanthropists, who asserted the value of mathematics, science, modern languages, and history. The representatives of classical learning after the Renaissance (q.v.)—Petrarch, Erasmus, Sir Thomas More, Ulrich von Hutten, George Buchanan, Casanbon, Scaliger—are called humanists. On the other hand, by humanism is sometimes meant the Pragmatist (and not merely intellectualist) view of human nature; as in Schiller's *Humanism* (1903; enlarged, 1912). See PRAGMATISM.

Humanitarians affirm the humanity and wholly deny the divinity of Christ (see UNITARIANS), believe in the perfectibility of man (see SAINT-SIMON), or profess the 'Religion of Humanity' (see POSITIVISM). Or, in modern usage, philanthropic (or, uncomplimentarily, hyper-philanthropic) people are called by the name; see CAPITAL PUNISHMENT, VIVISECTION, VACCINATION, VEGETARIANISM, ANIMALS (CRUELTY TO), CHILDREN.

Humayun (1508–56), was one of the Mogul emperors of India, being the son of Baber, whom he succeeded in 1530. He was driven out by the Afghans, and took refuge in Persia, but in 1555 he regained his capital, Delhi. His son was famous as Akbar the Great. Humayun's tomb near Delhi is one of the finest examples of Indian workmanship.

Humber, the estuary of the rivers Ouse and Trent (and so of the Dove, Derwent, Wharfe, &c.), runs east and then south-east for a distance of 38 miles, separating the counties of York and Lincoln, with a breadth varying from 1 to 8 miles. Its drainage basin, with an area of over 9000 sq. m., is the largest in England; and by means of navigable streams and canals the Humber is connected across England with the Mersey, the Severn, and the Thames. The navigation is obstructed, especially on the north side, by banks and shoals. The Humber was the southern boundary of the ancient kingdom of Northumbria in the wider sense, and of Deira when Northumbria was divided into Bernicia and Deira; Mercia lay south of the estuary. By way of the Humber Danes and Northmen made many terrible incursions into England, notably in 867, 1013, 1066, and 1069. The great port on the Humber was anciently Ravenser or Ravenspur, just inside Spurn Head. The process of erosion by the sea was already at work when Henry Bolingbroke landed there in 1399; soon after the place was wholly covered by the encroaching waters, and Hull became the port on the north shore, as Grimsby now is on the south. See books on the lost towns by Boyle (1889) and Shepherd (1912).

Humber, a river of Western Newfoundland, flows SW. through Deer Lake to Humber Arm, a branch of the Bay of Islands. A scheme supported by the British and Newfoundland governments will develop hydro-electric power (about 250,000 h.p.) for paper-mills at the new town of Comer Brook, and for the whole of the west coast, including the wide mining area.

Humbert, or (Ital. UMBERTO) (1844–90), King of Italy from 1878, in succession to his father Victor Emmanuel II., was a popular sovereign (see ITALY), but met his death by an anarchist's bullet. See Life by Salazar (1914), and ITALY.

Humble-bee. See BEE.

Humboldt, a river of Nevada, rises in the NE. part of the state, and flows WSW. to Humboldt Sink, a lake over 40 miles in circumference, which has no outlet. Length, nearly 350 miles. The river, which is unnavigable even for canoes, is strongly impregnated with alkaline matter, and the region through which it flows is barren.

Humboldt, **FRIEDRICH HEINRICH ALEXANDER, BARON VON**, one of the greatest of naturalists, was born at Berlin, 14th September 1769. His father, whom he lost when he was not quite ten years of age, was chamberlain to the king of Prussia. He studied at the universities of Frankfurt-on-the-Oder, Göttingen, and elsewhere; and during his residence at Göttingen (1789-90) he made those visits of scientific exploration whose fruit was his first independent work, a treatise on the basalts of the Rhine. In the spring and summer of 1790 he made a tour through Belgium, Holland, England, and France. In June 1791 he entered the Mining Academy at Freiberg, where he enjoyed the instructions of Werner. His eight months' residence here led to the publication of his *Flora Subterranea Fribergensis* (1793). He was afterwards appointed to an office in the mining department, and spent some years in this capacity, chiefly at the Fichtelgebirge, in Upper Franconia. His researches here resulted in a work on the irritability of the muscular and nervous fibres of animals (1799). The desire of visiting tropical countries, however, led him to resign his office, and devote himself entirely to the study of nature. He spent three months at Jena, where he was the intimate associate of Goethe and Schiller. At Paris he contracted a friendship with Aimé Bonpland, afterwards his companion in many and various scenes. Some time after he obtained permission from the Spanish government to visit all the Spanish settlements in America and the Indian Ocean. He sailed from Corunna along with Bonpland on 5th June 1799. They visited Teneriffe, ascended the Peak, and made many scientific observations. On 16th July they arrived at Cumana in South America, and in the course of five years explored a vast extent of territory in what are now Venezuela, Colombia, Ecuador, and Peru, as well as in Mexico, which they crossed from west to east. In Havana Humboldt prepared materials afterwards employed in his *Essai Politique sur l'Isle de Cuba* (1826). At Paris he occupied himself in the arrangement of his collections and manuscripts, and jointly with Gay-Lussac made experiments on the chemical constitution of the atmosphere. Having visited Italy, and returned to Berlin, he accompanied Prince Wilhelm of Prussia in 1807 on a political mission to France, and obtained leave from the government of his own country to remain there for the publication of his travels, for which the disturbed state of Germany at that time did not allow proper opportunity. He continued to reside in Paris till 1827. The wish of the king that he should reside in his native country was gratified in 1827, when he proceeded to Berlin, and there, in the winter of 1827-28, he gave lectures on the *Cosmos*, or physical universe.

In 1829 Humboldt again became a traveller, the Emperor Nicholas then sending out a well-appointed expedition to the north of Asia, to explore the Ural and Altai Mountains, Chinese Dzungaria, and the Caspian Sea. In this expedition Humboldt was accompanied by his two friends Ehrenberg and Rose. Its principal results were the scientific examination of the beds which produce gold and platina, the discovery of diamonds in an extra-tropical region, the astronomical determination of positions, magnetic observations, and geological and botanical collections. The whole journey occupied nine months, and extended to 2320 miles,

and is described in a work by Rose (2 vols. 1837-42) and in Humboldt's *Asie Centrale* (3 vols. 1843). The political changes of the year 1830 led to Humboldt's employment in political services; he was chosen by the king of Prussia to carry to Paris his recognition of Louis-Philippe, and during the ensuing twelve years was frequently sent to Paris to reside for four or five months. He accompanied the king of Prussia also in visits to England, Denmark, &c. During this time he published his *Examen Critique de la Géographie du Nouveau Continent* (5 vols. 1835-38). Humboldt spent the later years of his long life at Berlin, where he occupied a high position at the Prussian court. His last great work, *Cosmos* (5 vols. 1845-62), has been unanimously recognised as one of the greatest scientific works ever published, exhibiting in most lucid arrangement many of the principal facts of the physical sciences and their relations to each other. The style, however, is somewhat heavy, and, seen from our present standpoint, the author's views are in many respects defective. The germ of the work was the author's lectures in Berlin in 1828, themselves partially based on his *Ansichten der Natur* (1808). Humboldt died in his ninetieth year, May 6, 1859.

It is not easy to estimate the amount of Humboldt's contributions to science. The geography of Spanish-America was most imperfectly known previous to his travels there, during which he astronomically determined more than 700 positions, and he bestowed much labour on the preparation of the maps in which his discoveries were exhibited. His barometrical observations were likewise very numerous, as well as his observations on all points connected with meteorology. To him we are indebted for the most important generalisations concerning magnetism and also climate. He obtained distinction also by his labours in the determination of the magnetic equator, and by his observations on electrical eels, and on the respiration of fishes and young crocodiles. The editing and preparing of the great work of the American journey occupied twenty years of his life; and in his work he had the assistance of many of the most eminent scientists of the time—Cuvier, Latreille, Gay-Lussac, Thenard, &c.—as well as the most distinguished artists and engravers. There is but one complete edition of the *opus magnum* (1807-17), in 30 vols. (20 folio and 10 quarto); the so-called small edition being but excerpts. The title of the whole is *Voyage aux Régions Équinoxiales du Nouveau Continent, fait en 1799-1804 par Alexandre de Humboldt et Aimé Bonpland, rédigé par Alexandre de Humboldt*; and it falls into six sections, some of which and their parts are quoted as separate works (*Relation Historique, Observations de Zoologie, Observations Astronomiques, Physique générale et Géologie, Plantes Équinoxiales*, with atlases, essays, &c.). Humboldt is unquestionably one of the great figures of the century, and in private life was remarkable for benevolence and kindness, while his most conspicuous defect was vanity.

See the great biographical work, edited by Bruhns, *Alexander von Humboldt: eine wissenschaftliche Biographie* (1872; Eng. trans. 1873); and Lord Houghton's *Monographs* (1873). His correspondence with many of the most eminent men of the time has been published in many separate works—with Varnhagen (1860), with Von Raumer (1869), with Goethe (1876), with Campe (1877), with his brother Wilhelm (1880), with Arago (1907).

Humboldt, **KARL WILHELM VON**, the elder brother of the preceding, eminent as a statesman and for his works on philology, æsthetics, and general literature, was born at Potsdam, 22d June 1767, and educated at Berlin, Frankfurt-on-the-Oder, and Göttingen. He eagerly studied

antiquities, aesthetics, and the Kantian philosophy, as well as law, to which he professedly devoted himself. After travelling in Germany, France, and Switzerland, he acquired the rank of counsellor of legation, but showed little inclination for official employment. In 1791 he married, and for some years resided chiefly on his wife's estate in Thuringia, and afterwards in Jena, associating most intimately with Schiller, and devoting himself to poetry and other literary and scientific pursuits. A valuable memorial of his friendship with Schiller is the correspondence between them. From 1797 to 1799 Humboldt resided partly in Paris and partly in Spain, and in 1801 became Prussian resident at Rome, where he remained for a number of years in this capacity, and in that of minister-plenipotentiary, a most generous patron of young artists and men of science. From Rome he returned to his native country to fill the high place of first minister of Public Instruction. Berlin university owed its existence to him. In 1810 he went to Vienna as minister-plenipotentiary, and from this time he took part in all the most important political affairs in which his country was concerned. After 1819 he resided chiefly at Tegel, where he laid out fine pleasure-grounds, and formed a noble collection of

sculptures by the greatest masters. He died 8th April 1835.

His earliest literary works were collected by himself under the title of '*Æsthetic Essays*' (*Æsthetische Versuche*, 1799). His *Gesammelte Schriften* appeared in 1903 *et seq.* Humboldt devoted himself with the greatest assiduity to the study of philology, and was the first to make the study of the Basque tongue a scientific pursuit. He also spent much labour on the languages of the East, on various questions connected with oriental literature, and on the languages of the South Sea Islands. One of his most important works is on the Kawi language in Java (3 vols. 1836-40), published after his death by Edward Buschmann; the introduction to this, '*On the Variety of Structure in Human Speech*,' and his reflections on the influence thereof on the intellectual progress of mankind, mark a new era in the science of philology. *Letters to a Female Friend* (1847; Eng. trans. 1849) exhibit his character in a most pure and amiable light. See the admirable biography by Haym (1856), and his correspondence with Schiller (1830), Goethe (1876), Körner (1879), his brother Alexander (1880), Schlegel (1908), his wife (1910 *et seq.*).
